has been celebrated by Wordsworth in *The White Doe of Rylstone* and *The Force of Prayer*. The remains range from Early English to Perpendicular; and the nave of the church has been restored for service. The old barn of the abbey is still in use; and the gateway, familiar through Landseer's picture, has been incorporated in Bolton Hall, a modern seat of the Duke of Devonshire.

Boma, a port on the right bank of the Congo, 50 miles from its mouth, capital of Belgian Congo till its supersession by Kinshasa. See CONGO.

Bomarsund, a fortress on Åland Island, commanding the Gulf of Bothnia. In August 1854 it was destroyed by an Anglo-French force, after a six days' bombardment. The treaty of Paris bound Russia not to restore it. See ÅLAND ISLANDS.

Bomb. The word is derived from *bombos*, signifying a deep humming noise, and is probably onomatopoeic. It occurs in most European languages with nearly similar spelling and with similar meaning. It denotes a hollow vessel, usually of iron and of spherical shape—though not necessarily the latter—containing explosive, incendiary, smoke-producing, and, latterly, poisonous material. In ancient English works on Artillery and lists of ordnance stores it was applied to the hollow projectiles for ordnance, which, since about 1750, have been termed Shell (q.v.). Thus we have in a Board of Ordnance warrant, for service in Flanders, dated 27th February 1692, '200 Boombs' for the 8-inch howitzers. But the term, after the date named, came to signify an explosive missile thrown by hand or deposited on the ground in contradistinction to a missile thrown from a gun, howitzer, or mortar. As a result of the war of 1914-18 the old practice has been revived, and the projectiles for the smooth-bore trench mortars, described hereafter, are termed bombs, though they are elongated and not spherical, and closely resemble shell both internally and externally. The name is applied, more legitimately perhaps, to the missiles dropped from aircraft. The hand-grenade is really a small bomb, and the 'depth charge' a bomb used at sea, and some account is given of both hereafter.

Whether we call them bombs or shell, the war of 1914-18 resuscitated the use of explosive and other missiles projected from smooth-bore mortars, and of hand-grenades, in a very remarkable manner. It was a striking case of like causes producing like effects; for, just as the soldier of old was supplied with hand-grenades, and the artillery with small mortars throwing shell, for use in the trench warfare which was a necessary concomitant of the innumerable sieges occurring in the wars of the past, so the trench warfare which started early in 1915 brought about an insistent demand for an armament which it was previously generally believed had been finally relegated to museums. The occurrences at the siege of Port Arthur in the Russo-Japanese war (1904-5) did not do much to shake this view, although at that siege hand-grenades and bombs thrown by trench mortars were used plentifully. Most nations, including Great Britain, however, did adopt a hand-grenade charged with a modern high explosive, but did not manufacture any large supply of them, or take any serious steps in training troops in their use; while, so far as is known, nothing was done by any nation to provide an armament of trench mortars. Consequently, just as at the siege of Port Arthur, hand-grenades and missiles for trench mortars were at first improvised from food-tins filled with gun-cotton surrounded with bits of iron, with a piece of slow-burning Bickford fuse fixed into a detonator containing fulminate of mercury inserted in the gun-cotton and lit by a match or by the flash of discharge of the mortar to cause explosion of the missiles after striking; and trench mortars were

made out of any lengths of iron piping available, with an end plugged up. It may be remarked that gun-cotton, Bickford fuse (see FUSE), and detonators, being articles of regular equipment for demolition by explosion, were available in considerable quantities. The propellant used was gunpowder. It is unnecessary to give any detailed account of the missiles and mortars used during the early stages of trench warfare. All the combatants went through the improvisation stage in the field, and all made strenuous efforts to make up for their unpreparedness by organised manufacture at home on an enormous scale—to improve designs latterly, but in the earlier stages to produce the best of the existing improvised patterns, which, if crude, were usually capable of rapid production. The production of bombs for aircraft, however, did not pass through this improvised stage, as these missiles, for reasons explained hereafter, demand organised resources for their satisfactory manufacture.

Some account will now be given of the various articles which may be included under the heading of bombs, and of the mortars and other means of propelling them.

The Hand-grenade.—The word grenade is derived from a word of very similar spelling, denoting the pomegranate in languages derived from Latin. This missile dates back to the 16th century at least; and so much was it used that in the latter half of the 17th century grenadier companies of picked men were formed in the regiments of all armies, and these companies existed in the British service up to 1858. Grenades have been made of all sorts of material, including glass, but for at least three hundred years prior to 1904 had been, in all armies, hollow spheres of iron weighing about 3 lb. and containing about 4 oz. of gunpowder. They were provided with a small conical wooden fuse (see FUSE) driven into, and jammed in, the filling-hole (see fig. 1). This fuse was lighted either by slow-match (hemp rope steeped in solution of saltpetre mixed with wood ashes), or by a friction bar embedded in the fuse-composition (see *Tube* under CARTRIDGE). The fuse burnt about seven seconds, and immediately after its ignition the grenade was thrown, and a trained man could throw it about 25 yards. They were formally declared obsolete in the British service about 1898, but had not been made for many years, and it is doubtful if any hand-grenades of this kind have been made by any nation since about 1860. But they were very efficient having regard to the explosive they contained, and, as will be seen from what follows, contained all the essentials of hand-grenades as perfected by the latest war experience. The high explosives (see DY-

Fig. 1.—Section.

NAMITE) used in modern hand-grenades enabled a grenade much lighter than 3 lb. to be equally, if not more, efficient.

Ignition by time-fuse, whether made of wood, or of the Bickford type, made of woven fabric, while simple, has two drawbacks: firstly, the necessity for ignition by a match just before the grenade is thrown, unless some sort of draw-bar ignition is embodied in the fuse, as in the old French grenade shown in fig. 1 above. Both these methods of ignition are liable to failure at the critical moment from exposure to wet. Secondly, as the time-fuse must burn for its full time of about seven seconds before

the grenade explodes, it is possible, if it be thrown to a short distance, for those attacked to take cover from the explosion, or even to pick up the grenade and throw it away. Consequently the Japanese in 1904-5 introduced a grenade acting by percussion, and a pattern of a similar kind was adopted in 1908 by Great Britain and by other powers at, or about, the same time. Now the correct functioning of any simple percussion-fuse, whether of the 'graze' or 'direct action' type (see FUSE), demands that the fuse shall always strike the ground or objective so that the needle shall be driven on to the detonator; and, as the fuse is usually fixed in the nose of the grenade, that the latter shall strike point first. As a missile thrown by

Fig. 2.

hand, or the projectile projected from a smooth-bore gun, may strike in any position, steps must be taken, by the provision of vanes or streamers, suitably attached to the rear of the missile, to catch the wind, and so to keep the point leading. The grenades adopted shortly after 1905 were practically all of the 'stick' variety; that is, they consisted of a cylinder of iron, or of tin-plate with iron or lead rings surrounding it to produce fragments on explosion, fastened to a wooden or cane stick with a bunch of tapes attached to the handle (see fig. 2). The cylinder was filled with a high explosive in which was embedded a detonator of fulminate of mercury. Usually a 'direct action' percussion arrangement was provided whereby a needle, attached to the inside of the front closing cap, could be crushed down and strike the detonator. Suitable safety arrangements—usually a safety-pin preventing the needle striking the detonator even if the grenade were given a very severe blow on its nose—removed just before throwing, were provided to give safety in handling and transport. These 'stick' grenades weighed about 2 lb. and had bursting charges of about 3 to 6 oz.

The objection to these and the other innumerable patterns of percussion hand-grenade are twofold. In the first place, the uncertainty of their action on striking. With a good long throw, so that the blow on striking is fairly heavy and the streamers have time to act, and if the object struck is not very soft, correct action usually results; and this is also usually the case with a short throw *carefully* made; but, unfortunately, experience proved that failures were frequent. In the second place, it was found that when swinging back the stick to throw the grenade, the nose was apt to be struck against the back-wall of a narrow, deep trench, and the grenade was fired prematurely. Consequently this pattern, and another similar to it, but with a shorter stick, were abandoned. It cannot be said that a simple and safe percussion action, which is also certain in its action, has yet been devised for hand-grenades, without the use of some additional means for making the missile travel point first, which shall in its turn be absolutely effective for short throws, made anyhow, and without exercising special care. The Germans used time-fuses in the main, though they had one pattern with a percussion action capable of action in whatever position the missile might

strike. This, however, involved a somewhat elaborate, and not perfectly certain, method of making the absolutely essential safety device unlock during the flight of the grenade after it has left the thrower's hand. This class of 'Allways' fuse is described hereafter in connection with mortar bombs, with which, owing to the different conditions of their employment, it is quite efficient. With rifle grenades also, which travel point first, a simple percussion is possible. See below.

The result of the experiences described above was reversion in the British service to time action for all hand-grenades, with a self-contained ignition gear by which the fuse is ignited either just before, or by the action of, throwing. At first friction ignition with a draw-bar was used, as in the old French hand-grenade already described; but this system, never entirely satisfactory even under favourable conditions of a good sharp pull with the article to be ignited firmly held, as is a tube in a gun, was rapidly dropped in favour of a percussion-cap, in contact with one end of the Bickford fuse, ignited by a blow delivered either by hand just before throwing, or by a compressed spring released in the act of throwing. The two methods are shown diagrammatically in figs. 3, 4, and 4a.

As to fig. 3, *A* is the iron body of the grenade with a filling-hole, *B*, closed by a plug. *C* is the charge of high explosive of about 4 to 6 oz. *D* is a sheath of brass, but latterly of steel, with thin walls. Inside the sheath, *D*, and resting on a shoulder or contraction, *E*, is the percussion-cap, *F*, in contact with one end of the Bickford fuse, *G*, the other end of which is fixed by crimping into the elongated copper capsule, *H*, containing about 15 grains of fulminate of mercury or a mixture of fulminate with chlorate of potash. Above the cap, *F*, suspended by a thin shearing wire, *J*, and strong safety-pin, *K*, is the hammer, *I*, provided with the needle, *L*. The action is as follows. The safety-pin, *K*, having been pulled out by its loop, the hammer, *I*, is only supported by the thin shearing wire, *J*. If the hammer be struck a sharp blow on any hard object (the heel of the boot will

Fig. 3.—Section.

do), the shearing wire is broken and the needle strikes and fires the cap; this lights the Bickford fuse, which, after three to five seconds (usually the latter), according to the length of it used, ignites and explodes the fulminate and thereby the main charge of high explosive. Suitable provision is made so that the hot gases produced by the Bickford fuse as it burns shall escape and not heat up the walls of the sheath, *D*, to the ignition-point of the explosive, *C*, in contact with it.

As to figs. 4 and 4a, the letters *A* to *F* have the same significance as in fig. 3. It will be noticed, however, that the sheath, *D*, is turned back on itself, and that the detonator lies alongside the striker. This is done to give room for the spring striker action without lengthening the bomb unduly. The striker action consists of a hammer with needle (or side-prongs if a rim fire-cap be

used), *M*, which is ready on release to be driven on to the cap, *F*, by the compressed spring, *N*. Prior to release the hammer, *M*, is held by one end of the curved detent, *P*, which fits into a notch,

Fig 4.—Section.

Fig. 4a.—Elevation.

O, in the hammer, *M*. The detent, *P*, as shown in fig. 4a, lies close to the outside of the grenade and between two lugs, *Q*, projecting from the latter; it is secured in this position by the safety-pin, *R*. The reason for the great length of the detent, *P*, is to enable it to be held down easily by the hand after the safety-pin is removed and prior to throwing. When the grenade is thrown, the detent, no longer held, is tilted out of its seating by the action of the spring, *N*, and falls away clear of the grenade. The needle strikes the cap, *F*, and the rest of the action is the same as has been described for fig. 3. The action last described is that used in the bulk of grenades, containing about 1½ oz. high explosive, in the British service supplied by millions in the last three years of the war of 1914-18. It weighs about 1½ lb. and is highly efficient, and has only one objection, in that, obviously, if the detent be released accidentally after removal of the safety-pin, ignition takes place instantly. It is in this respect that percussion action, as already stated, must always have a considerable advantage.

Hand-grenades containing smoke compositions and poison-gases were used also. They were usually ignited as described for fig. 3.

The Germans favoured in the main a 'stick' grenade with a rather large charge of about 8 to 10 oz. contained in a tin-plate container; the friction ignition gear was in the wooden handle, though they used also the grenade with the 'Allways' percussion action mentioned above, and a small grenade very similar to that shown in fig. 3 except that its ignition was by friction bar or wire.

The Rifle Grenade.—This is practically a hand-grenade, provided with a percussion mechanism of the 'direct action' or 'graze' type in its nose. Projecting from its base is a steel rod which fits into the barrel of the rifle. A cartridge without a bullet is, of course, required to drive it from the rifle. A grenade, complete with its rod, weighing about 1½ lb., can be projected to a maximum range of about 200 yards with the rifle elevated to 45°. Owing to the violent impulse on firing, the safety and other fittings of the percussion or time fuse can be similar to those in guns, while the rod, acting as a tail, causes the grenade to strike point first. Rifle grenades fitted with stars and a time mechanism, set in action on discharge, are used for signalling purposes.

Trench Mortars.—The trench mortar, as used at the commencement of the war of 1914-18, and for some time afterwards, was only expected to throw a bomb of light construction weighing about

10 lb. to a range of about 400 yards, and not much accuracy was expected from it. The bombs were made of tin-plate strengthened with wood blocks internally, and the explosive was surrounded with steel and iron scrap. The time-fuse was similar to that used for hand-grenades, but the time of burning could be regulated for different ranges by cutting off portions of the Bickford fuse. The mortar was always elevated to 45°, and the range was varied by using different charges. When a demand was made that heavier projectiles should be fired, the principle of the rifle grenade was adopted, and a heavy bomb, having a steel rod about 2 inches in diameter which fitted into a comparatively light tube forming the mortar, was supplied. Though satisfactory from the point of view of giving a mortar which could be transported and handled fairly easily, the plan was dropped after a time, as the shooting was very erratic; while the necessarily heavy rod, to stand the stress of firing, formed a large percentage of the total weight propelled, and did not break up on the burst of the bomb and so add to its destructive power; further, owing to its weight and small air resistance, the rod did not always act as a tail and keep the bomb point first, and the percussion-fuses therefore often failed to act. Gun-cotton charges were used for the smaller mortars, and cordite for those throwing the bombs with rods.

The lighter mortars, i.e. firing bombs up to about 25 lb. in weight, finally adopted are fairly elaborate weapons, though still smooth bore, with a provision for elevation and traversing by screws. Changes of range can be effected by change of elevation between about 45° and 75° with any charge selected, and there are five or more different charges giving ability to fire at all ranges between about 100 yards and 800 yards. The mounting (see fig. 5) consists of two legs, *A*, which are hinged so that they can

Fig. 5.

be shut together for transport or opened out to support the mortar in front. Above the hinge is a boss in which are the elevating screw and the gear by which it is actuated, the gear being moved by the handle, *B*. At the top of the elevating screw is fixed a cross-head crutch, *C*, carrying the traversing screw worked by the handle, *D*. On this screw is a nut which is fastened to the mortar by means of a collar, *E*, which is detachable. The breech end of the mortar has a ball-shaped boss which fits into a socket in the steel base-plate, *F*, which is well set into the ground at an angle of about 45° to resist the recoil. The base-plate is about 2 square feet in area.

The mortar, legs with traversing and elevating gears attached, and base-plate each form a load which can be carried by one man, the mortar being the heaviest.

Larger trench mortars up to nearly 10-inch calibre, with much heavier appurtenances, have been used, and doubtless will be used again for special purposes. The Germans had rifled mortars mounted on quite elaborate wheeled carriages with recoil buffers, but whether such equipments should be styled trench mortars is doubtful, as they could only exceptionally be used actually in the trenches. They were practically howitzers. (See CANNON.)

Trench Mortar Bombs.—The bombs used in the

later stages of the war were cylindrical with square end, but otherwise differed but little in essentials from shell fired from guns (see SHELL) for similar purposes, except that, being called upon to resist much smaller stresses than in guns, owing to the small charges used, they have thinner walls and contain, in proportion to their weight, larger bursting charges. They have been used, as in the case of gun-shell, with all sorts of contents—viz. high explosives, smoke compositions, incendiary compositions, and poisonous gases. The methods of disposing the propelling charge and of firing it were, however, quite novel. Projecting from the centre of the bottom of the *inside* of the breech of the mortar is a nipple, and attached to the centre of the base of the bomb is a socket made to hold an ordinary 12-bore Sporting Cartridge (q.v.). As the mortar is always fired tilted at a considerable angle, usually not less than about 45°, a bomb, inserted into the muzzle and then released, will slide down to the bottom of the mortar with considerable velocity, and as a result the cap of the cartridge will strike forcibly against the nipple projecting from the inside of the breech, and be fired thereby. The cartridge-socket has perforations in its walls so that the gases of explosion can escape. To reinforce the primary charge in the cartridge, bags in iron form containing explosives can be fitted over the outside of the socket, being ignited by the gases escaping through the perforations. The firing arrangements are shown in fig. 6.

Fig. 6.—Part Section.

Fuses for Bombs.—Bombs are in some cases provided with tails to make them travel point first; but as these tails must be fairly stout to stand even the low pressures in trench mortars, they add to the weight to be propelled without increasing the number of effective fragments on burst. Usually bombs cannot be depended upon to strike point first any more than hand-grenades, and the fuses used are designed accordingly, and are of two kinds. The first, which is fixed on the head of the bomb, has a striker mechanism on exactly the same principle as that shown in fig. 4, and ignites a piece of Bickford fuse, which is, however, straight, and leads down to a detonator in the middle of the bomb. Owing to the rapid impulse imparted to the bomb on firing, the principle of 'set back' is used to release a securing device which holds the detent, *P*, when the safety-pin is withdrawn prior to firing. The other fuse is similar to that employed by the Germans for hand-grenades, as already stated, and termed the 'Allways.' The action of this class of fuse is shown diagrammatically in fig. 7. *A* is the body of the fuse screwed into the head of the bomb, *B*, and provided with an internal cavity with coned ends. Inside this cavity are the two portions of the percussion mechanism. One part, *C*, carries the needle, *D*, which fits in a hole in the other part, *E*, provided with a detonator, *F*. The two parts are kept apart by a stout pin, *G* (which is ejected by a compressed spring released by 'set back' on firing; the spring is not shown), and a weak 'creep' spring, *H*. The outer ends of *C* and *E* are coned to fit the coned ends of the cavity in the body, *A*. Supposing the pin, *G*, to have been ejected, the two parts, *C* and *E*, would only be kept apart by the weak spring, *H*. If, now, the fuse were moving forwards and were sharply checked, the part *E* will set forward owing to its momentum compressing the spring, *H*, and the needle, *D*, will strike and fire the detonator, *F*, the flash of which will communicate by the channel,

I, with suitable detonating arrangements in the bursting charge of the bomb. Similarly, if the bomb strikes base first, the part *C* will set forward and drive its needle into the detonator. Should the

Fig. 7.

bomb strike sideways, the two parts, *C* and *E*, will be pressed together, as their coned ends will slide in the direction of motion along the coned seatings of the cavity. There are obviously many other ways of disposing the parts of fuses of this class, but they all depend upon the slip between a member or members with coned or spherical ends and spherical or coned recesses causing alteration in the space occupied by the system of parts selected.

As pointed out, trench mortars have been made up to about 10 inches calibre and firing projectiles weighing about 150 lb. There are, however, two limitations to an increase of their size apart from the weight of the mortar itself. The first is the difficulty in the transport of ammunition as long as these weapons are used as their name implies; for wheeled transport can only rarely be feasible. Even with light mortars this difficulty hampers movement, and when, for any purpose, their fire is required in quantity, steps must be taken beforehand to accumulate a supply of ammunition at the position from which fire is to be opened. Another limitation is that, if very heavy mortars with correspondingly large projectiles are used, retaliation by artillery fire from guns or howitzers results; and as the slow-travelling large mortar projectile can easily be seen in its flight, it is not difficult usually to locate the place from which it starts and to concentrate fire on it, with the result that the mortar will be destroyed unless particularly well protected. The opinions as to the real value of trench mortars are somewhat divided, but it is generally conceded that, whenever trench warfare on a large scale takes place, the trench mortar will again be required, and be improvised if not immediately available as a recognised armament. There is no difference of opinion, however, as to the value of the hand-grenade for many purposes beside the requirements of trench warfare proper. In the final assaults of temporarily fortified posts such as must frequently occur in so-called 'open' warfare or 'war of movement,' the hand-grenade will play an important part.

Bombs for Aircraft.—These bombs have been made in all sizes, from small incendiary ones weighing less than 1 lb. up to enormous ones of 600 lb. and more filled with high explosive. There is of course, theoretically, no limit to the size of these bombs except the carrying-power of the aircraft using them, but there are the practical limits of cost, ease of handling, and the uncertainty of hitting any assigned objective unless it be very large and the aircraft can descend, without undue risk, fairly close to it before releasing the bomb. This last consideration renders the carriage of more than one bomb very desirable. The first essential of an air-

craft bomb is that it shall strike point first, as this will enable a simple percussion-fuse to be used; this is desirable for all bombs, but it is specially important with those for aircraft, for the bulk of bombing-work is done by aeroplanes, and as these often make very rough landings while carrying their live bombs, it is important that the fuses in the latter shall be strong and simple, and easily provided with thoroughly reliable safety appliances which will prevent their firing by shock due to rough handling. Consequently these bombs are provided with tails and are often made pear-shaped, as this form

Fig. 8.

facilitates attachment of the fins of sheet-steel forming the tail. A common form is that shown in fig. 8. The strength of the bodies of the bombs varies with the work to be done by them. Where perforation of resisting material, or the projection on burst of heavy fragments, is desired, the bomb will have thick walls, and for a given weight will hold less explosive; but where the production of surface effect, such as a large crater, is required, the arrangements are reversed. Bombs are slung below aircraft either head down or horizontally, head in front, and convenient and reliable releasing gear, as well as sights to guide the moment of release, are essential features of aircraft used for bombing. Aircraft bombs have been usually filled with explosive or incendiary material; smoke bombs and parachute light bombs for illuminating purposes are also used. So far as is known, aircraft bombs filled with poisonous gases have not been used by any belligerent. There can be no question of the great material, and still more of the moral, effects of aircraft bombs, and it is their unenviable peculiarity that non-combatants are nearly as qualified as combatants to pronounce an opinion upon them in this connection.

Depth Charges.—These are steel cylinders containing a large charge of high explosive for use against submarines. They are carried slung over the sterns of vessels told off for anti-submarine work, and can be dropped instantly upon the ascertained, or supposed, position of a submarine; they are provided with special fuses which explode the charge when it has sunk to a certain depth; they are wholly products of the war of 1914-18, and date actually from 1916. They have been very successful. See the articles GRENADE, SHELL, MORTAR, MACHINE GUN.

Bomb, in Geology, a more or less rounded lump of rock, often hollow, believed to have solidified from a whirling mass of molten material thrown out by a volcano. Some bombs, however, seem to have formed in a lava-stream, without having travelled through the air.

Bomba was an opprobrious nickname bestowed on Ferdinand II. of Naples (1810-59), in consequence of his cruel bombardment of Naples, Messina, and other cities of his realm during the revolutionary troubles of 1849.

Bombacaceæ, or BOMBACEÆ, a family of dicotyledons, allied to Malvaceæ (q.v.), with which some unite it. The twenty genera, of over a hundred species, are mainly tropical American, but some are found in Asia, Africa, and Australia. The family includes several well-known and important trees, often of great size and fantastic form of trunk,

egg-shaped or bottle-shaped, owing to the presence of much water-storing tissue. The chief genera are *Adansonia* (see **BAOBAB**), *Durio* (see **DURIAN**), *Bombax*, and *Eriodendron*. For kapok, the floss obtained from the two last-named, see **SILK-COTTON**.

Bombard, a kind of cannon in use about the close of the 14th century and later, short, thick, and wide in the bore, sometimes capable of throwing balls of stone of 200 and even 500 lb. weight.

Bombardier, the lowest non-commissioned officer in the British artillery, ranking with corporals in the infantry and cavalry. The name was applied in the 17th and 18th centuries to a man employed about the mortars and howitzers—pieces of ordnance used in bombarding.

Bombardier Beetle, a name given to several beetles, of the genera *Blachinus* and *Aptinus*, in the sub-family Carabidae, refers to their offensive and defensive habit of discharging an acrid volatile fluid with explosive force from the abdomen. Some ants and other insects exhibit the same device. The discharge has a pungent odour, acid and caustic properties, and evaporates with effervescence in the air. These beetles are usually found under stones or at tree-roots, often in great companies. The larger and more brilliant species are tropical. Several are British.

Bombardment is an attack upon a fortress or fortified town by means of shells and incendiary bombs, thrown by guns or from aircraft, to destroy the fortifications, burn the houses, and kill the people. It is most likely to be successful against a place destitute of bombproof cover, or one having a large civil population. A bombardment is a cruel operation, especially when, as is often the case, it is directed against the civilians and their buildings, as a means of inducing or compelling the governor to surrender the place and terminate their miseries. It requires little engineering science; whereas a regular siege, which is a much slower process, requires the aid of engineers to direct the attack against fortifications, guns, and soldiery, leaving the inhabitants and buildings untouched. In modern times a bombardment is generally adopted as an adjunct to a siege, distracting the garrison by an incessant fire from mortars and heavy guns day and night. At Sebastopol, for instance, the mortars fired shells into the centre of the city, while the forts were cannonaded by the siege-guns. Bombardment of a town was, by international agreement, illegal, unless the town was being defended by hostile troops, but the law was frequently broken on various pretexts in the Great War. The stores required for a vigorous bombardment are immense. In January 1871 the Germans, bombarding Paris and its forts, threw 10,000 shells daily into the place, of which 500 fell in the city itself. The siege and bombardment of Strasburg is also memorable. At Port Arthur the Japanese threw half-a-million shells into the place in six months. In the Great War siege artillery proved superior to all the permanent fortifications, and the usual method of gaining any place, be it fort or town or village or group of field-works, was to beat it flat with high-explosive shells.

Bombardon, in Music. See **SAXHORN**.

Bombastes Furioso, a burlesque of *Orlando Furioso* produced in 1810 by William Barnes Rhodes (1772-1826), chief teller of the Bank of England.

Bombax. See **SILK-COTTON**.

Bombay, a western province of India, with a Governor appointed by the crown, an Executive and a Legislative Council. Bombay, including Sind, comprises 29 British districts, and about 350 native or feudatory states, divided for adminis-

trative purposes into 18 agencies, and contains 186,923 sq. m., of which 63,864 are in native states. The Nerbudda River divides the presidency, as in accordance with the old name it is still often called (see **INDIA**), into two portions: in the north is Guzerat, chiefly consisting of alluvial plains, with the Cutch and Kathiawar peninsulas; to the south is the Mahratta country, which includes parts of the Deccan, Carnatic, and Konkan or coast-districts. The political control of Baroda (q.v.) was transferred in 1875 from Bombay to the supreme government of India. The small territories of the Portuguese—Goa, Daman, and Diu—have an area of 1638 sq. m. The coast-line is irregular, broken by the gulfs of Cambay and Cutch, with several fine natural harbours, Bombay and Karachi (Kurrachee) being the most important. The chief mountain-ranges run north and south; in the north are the Khirthar Mountains; in the south-east are the Western Aravalli range; south of the Tapti are the Sahyadri Mountains or Western Ghâts, which run almost parallel with the coast; the Satpura range runs east, and forms the watershed between the Tapti and Nerbudda. Sind is watered and fertilised throughout its whole length by the Indus; the Subarnati and Mahi flow through the plains of North Guzerat; the Nerbudda pursues a western course into the Gulf of Cambay. The Tapti flows through Khandesh district, entering the sea above Surat. Besides these, there are numerous hill streams, which are torrents during the rains and dry up in the hot season. The Runn of Cutch (q.v.), in the west of Guzerat, covers an area of about 8000 sq. m., and is the great source of salt-supply for the presidency. There are few minerals, and no coal; iron is mined at Teagar in Dharvar, and there is gold amongst the quartz. Good building-stone is abundant, with limestone and slate. In the dry sandy districts of Sind the thermometer has reached 130° in the shade; the mean temperature in Lower Sind during the hottest months is 98° in the shade. In Cutch and Guzerat the heat is slightly less. The average rainfall is 70 inches. The coast-districts are hot and moist, with a heavy rainfall. The tableland of the Deccan has an agreeable climate, except during the hot months.

The principal agricultural products are millet, legumes, rice, wheat, cotton, oil-seeds, tobacco, indigo, cane-sugar, &c. Marathi and Canarese are spoken in the south, Gujarati in the north-west, Sindhi in Sind, and west of the Indus Baluchi. For the government of the presidency, see **INDIA**. Bombay is the headquarters of an Anglican bishop appointed by the crown, and of a Roman Catholic archbishop. During the Mutiny of 1857 the local army remained, on the whole, faithful. Poona is the military centre. Bombay has benefited vastly from the establishment and extension of the Indian railway-system. The first railway in India was opened in Bombay in 1853; the presidency has now more than 4000 miles of railway, giving communication with all the important towns of India. A telegraph cable from Bombay to Aden was laid in 1869; there are now private company cables, while the Government Indo-European Telegraph Department has its headquarters at Karachi.

Of late years manufacturing industries have been extremely active in Bombay. Commanding the richest cotton-fields in India, it has improved to the utmost its natural advantages. The stoppage of the American cotton-supply during the Civil War gave a great impulse to the trade, and the wealth poured into Bombay at this period led to a vast extension of the trade, which partly continued after the period of inflation had passed. The first mill was started in 1854. There is still a large import of cotton goods from

England, but though the Indian cotton trade has often been greatly depressed, Bombay not merely

towards Mazagaon, are traversed by fairly wide streets, extensive lines of tramways passing through

Cotton Merchants at Bombay.

competes with Manchester in the Indian markets, but largely exports its own manufactures. The town of Bombay is naturally the chief centre of the cotton manufacture, as it is the place whence cotton and cotton goods are exported. For Indian cotton-growing and cotton-manufacturing, see also COTTON. The rapid growth and present condition of the cotton industry is the more striking in view of the abolition in 1881 of the duty on cotton imports, which placed the local industry at a disadvantage. These duties were reimposed at a later date. After cotton, the other great staples are wheat and seeds. The trade in Bombay opium, which is manufactured in the native states, is now much smaller and diminishing. Although of recent origin, the wheat trade has assumed large proportions. Other principal exports are sugar, tea, raw wool, woollen shawls, fibres, and drugs; while among the imports are machinery, metals, oils, coal, and liquors. Silk-weaving is carried on at Ahmedabad, Surat, Nasik, Yeola, and Poona; carpets are made at Ahmednagar; leather-work and pottery in Sind; brassware in Bombay city, Nasik, and Poona; cutlery, armour, and gold and silver work in Cutch.

The population of the presidency (including Sind) in 1921 was in the native states 7,412,341, and in British territory 19,283,663. Nearly four-fifths are Hindus, nearly one-sixth Mohammedans, the remainder being Jains and aboriginals, with a quarter of a million Christians.

Bombay (City) occupies the entire breadth of the SE. end of Bombay Island or Peninsula, bordering at once on the harbour inside, and on Back Bay outside. The island, now permanently connected by causeways and breakwaters with Salsette Island and the mainland, is over 11 miles long by from 3 to 4 broad. For administrative purposes the city constitutes a district by itself, with an area of 22 sq. m. Its harbour, studded with islands and crowded with shipping, is one of the finest in the world, the space available for shipping being about 14 miles by 5. Bombay is the most European in appearance of all the cities in India. In the business part there are several streets continuously lined with splendid buildings; while the bazaars, which extend from the fort

even the most crowded parts. Many of the private houses of European residents are built on the suburb of Malabar Hill, the ridge running into the sea forming the west of Back Bay, and at Breach Candy looking seaward. The Hindus and the Mohammedans form the largest section of the population, and the rest are Parsees, native Christians, Europeans, Indo-Portuguese, Jews, &c. Amid these various classes, the Parsees rank next to the English in position and influence. Among their leaders may be named Sir Jamsetjee Jeejeebhoy and Sir Dinshaw Manockjee Petit, merchant-princes who endowed Bombay with magnificent charities. The Banias, or Hindu traders, rank next to the Parsees. On the esplanade, facing

towards Back Bay, are the secretariat, the university (founded 1887), senate-hall, high court, offices of public works, sailors' home, and statue of Queen Victoria. In the neighbourhood of the fort are the town-hall, the mint, cathedral, and custom-house. The terminus of the Great Indian Peninsular Railway, opened in 1876, is the finest building in Bombay—probably the finest structure

of the kind in the world. On the promontory to the east of Back Bay stood the old fort, now a mere garrison, its walls having been demolished; the harbour is defended by batteries. It has an extensive system of quays, wharves, and docks, including Prince's Dock (1879) and Victoria Dock (1889). Extensions made in 1905-14 include some miles of deep-water quays, with railways and depots constructed upon a square mile of reclaimed land, a great dry-dock (1000 feet by 100), and the Alexandra wet-dock (nearly 50 acres' water-area). These improvements provide accommodation for the largest ships likely to pass through the

Suez Canal, and greatly simplify the handling of goods. Mazagaon Bay, the centre of shipping activity, is at the head of the harbour. The city water supply is, since 1892, drawn from Tansa Lake (q.v.), 55 miles N., where the 'Tansa Completion Works' were begun in 1923. A scheme for the reclamation of some 1150 acres of Back Bay was included in a development programme of 1920, but it has had to be considerably modified in practice. Bombay has profited largely by being the first important port reached by vessels from Europe, though its foreign trade, once greater than Calcutta's, is now less. The chief exports are cotton, wheat, shawls, opium, coffee, pepper, ivory, and gums; the chief imports, piece-goods, thread, yarn, metals, wine, beer, tea, and silk. Manufactures are increasing. Pop. (1901) 770,843; (1910) 979,445; (1921) 1,175,953.

In 1509, about a year before the capture of Goa, the Portuguese visited the island; and by 1532 they had made it their own. In 1661 they ceded it to Charles II. of England, as part of the dowry of his bride, the Infanta Catharine. In 1668 his majesty granted it for an annual payment of £10 to the East India Company, which, in 1685, transferred what was then its principal presidency to Bombay from Surat. The name of the island, styled Mainbi by the Portuguese of the 16th century, is said to be derived from the goddess Mumba-devi; Colonel Yule has traced it back to Mayamba, the name of the Konkan kingdom in the 16th century. The bay towards the mainland is one of the finest havens in India. Among the numerous islands are Elephanta (q.v.) and Salsette. An appalling and continued visitation of the bubonic plague killed 28,418 persons in 139 days of 1896-97, 28,869 in 115 days of 1898, 31,260 in 131 days of 1899, and 50,383 between November 1899 and April 1900. Vast numbers of the inhabitants fled from the city, and trade and commerce were wholly disorganised. Bombay is the birth-place of Jejeebhoy, Monier Williams, Dean Farrar, and Rudyard Kipling.

See books by Maclean (1876), Eastwick (1881), Hunter (1892), James Douglas (1900), and Malabari (1910).

Bombay Duck, or **BUMMALOTI** (*Saurus ophiodon*), a fish of the family Sceloporidae, nearly allied to the salmon and trout family. It is a small but voracious fish of elongated form, with large fins and a very large mouth, the gape of which extends far behind the eyes, and which is furnished with a great number of long, slender teeth, barbed at the points. It is a native of the coasts of India, particularly of the Bombay and Malabar regions, from which it is exported in large quantities, salted and dried, to other parts of India and elsewhere, being highly esteemed for its rich flavour, and often used as a relish.

Bombazine is a cloth for dresses, in which the distinguishing characteristic is that the warp is silk and the weft worsted. The cloth has thus a bare look. It is rather fine and light in the make, and may be of any colour. The fabric is now little used. It was extensively made, and chiefly at Norwich, from about 1816.

Bomb-proofs are military structures of such immense thickness and strength that shells cannot penetrate them. In every fort, the barracks, hospital, stores, and magazines are covered with masonry and earth, or even, in some cases, with thick armour-plates, in order to be impervious to the fire of the siege-guns and mortars. See **CASE-MATE**.

Bombyx. See **SILK**.

Bommel, a town in the Dutch province of Gelderland, on the Waal, 20 miles SSE. of Utrecht; population, 5000.—The Bommelerwaard is a fertile

island-district (16 by 6 miles), formed by the Waai and Maas.

Bona (Fr. *Bône*), a seaport town of Algeria, in the province of Constantine, situated on a bay of the Mediterranean, near the mouth of the Sebus, 220 miles W. of Tunis by rail. The town, divided into two parts, Upper and Lower Bona, is situated in a beautiful but unhealthy district at the foot of a hill, and is defended by a citadel and several forts. Since the occupation of Bona by the French in 1832, the town has been much improved, and has good bazaars, shops, markets, reading-rooms, &c.; manufactures of tapestry, saddlery, and native clothing; and a trade in phosphates, metals, wool, hides, corn, coral, and wax. The exposed roadstead has been made into a fair harbour. There are iron and copper mines near Bona. A telegraph cable was laid between Bona and Marseilles in 1870. Among the public buildings, the Catholic church and the convent of the Sisters of Mercy are most remarkable. Near Bona are some scanty remains of the once famous city, Hippo Regius, a centre of commerce and civilisation in North Africa destroyed by Khalif Osman in 646, the favourite residence of the Numidian kings, and the episcopal seat of St Augustine, who died here in 430. Conspicuous on a hill-top above the site of Hippo is the great basilica of St Augustine, inaugurated in April 1900. Pop. 45,000.

Bona is law-Latin for goods, and occurs in the Scottish legal phrase *in bonis*—i.e. forming part of the legal estate—and in the Roman phrase *bonorum possessio*. In English law the word has some technical applications: *Bona Vacantia*—such as wrecks, treasure-trove, waifs, and estrays, contrary to the general rule, which gives such things to the finder—vest in the crown; *Bona Waviata* consist of goods waived or thrown away by a thief in his flight, for fear of being apprehended; they belong to the owner if he prosecutes to conviction, otherwise to the crown. In cases of outlawry, the property forfeited to the crown is sometimes called *Bona Confiscata*.

Bona Dea ('the good goddess'), a mysterious Italian goddess of fertility, who is variously described as the wife, sister, or daughter of Faunus. She was worshipped at Rome from the most ancient times, but only by women, even her name being concealed from men. Her sanctuary was a grotto on Mons Aventinus; but her festival (the 1st of May) was celebrated in the house of the consul. The solemnities were performed generally by high-born vestals. At this celebration, no males were allowed to be present; even portraits of men were veiled. During the celebration in the house of Cæsar (62 B.C.), the infamous Clodius was discovered disguised as a female musician. The symbol of the goddess was a serpent, indicating her healing powers.

Bona Fides, a Latin expression signifying good faith, enters as a legal doctrine largely into the consideration of matters of agreement, contract, damage, trusts, and other departments of the law; and in all of them it requires the absence of fraud, or unfair dealing. This term, however, does not appear to occupy any formal or technical place in the law of England. It is the foundation of many just and enlightened maxims in the Roman jurisprudence, which in this respect, as in many others, has been followed by the legal system of Scotland. In the law of that country, a person who possesses and enjoys property upon a title which he honestly believes to be good, although it may be bad, is protected against the consequences of this illegal position, and he is entitled to retain the fruits or profits which he has reaped or received during his *bona-fide* occupancy. But

this protection ends when the possessor becomes aware of the insufficiency of his title, whether by private knowledge or otherwise. This rule, which is largely founded on the negligence of the true owner, would extend to a claim for interest on money erroneously paid to a person honestly believing himself the creditor. In the Scots law, again, while honest belief will not render valid a second marriage, the first subsisting, it would, it is thought, have the effect of rendering the children of such second or putative marriage *legitimate*, and would even confer rights of succession on the innocent husband or wife. The law of England is not so indulgent, for there children born under such circumstances would certainly be deemed bastards. As a general rule, parties are supposed to contract at arm's length, and therefore there is not much room for the doctrine of *bona fides* in considering business agreements, which depend on the true construction of the documents exchanged. Positive misrepresentation or fraud will of course upset a contract if it led to error, but it is only in certain classes of contracts, such as partnership, suretyship, insurance, &c., that the plea of undue concealment has much force. The amount of damages recovered is sometimes affected by the good or bad faith of the wrongdoer, as in the case of wilful trespass of mining boundaries, where the nature of the subject renders a severe check necessary. In trust administration the beneficiaries are entitled to place much confidence in the trustees, and bad faith on their part is severely dealt with. See **BASTARDS**, **BASTARDY**; and see on the subject of this article generally, **CONTRACT**, **DAMAGE**, **EXECUTOR**, **GUARDIAN**, **MARRIAGE**, **TRUSTEE**.

The interpretation of the term *Bona-fide Traveller* has given no little trouble to the magistrates of Scotland in reference to the famous 'Forbes Mackenzie (q.v.) Act.'

Bonaire. See **BUEN AIRE**.

Bonald, LOUIS GABRIEL AMBROISE, VICOMTE DE, a French publicist, born in 1753 at Monna, in Aveyron, was compelled to emigrate during the French Revolution, and employed his pen at Heidelberg on behalf of monarchy. His first important work, *Théorie du Pouvoir Politique et Religieux* (3 vols. 1796), was seized by the Directory. It prophesied the restoration of the Bourbons. Having returned to France, he was in 1808 appointed by Napoleon Minister of Instruction. In 1815 he voted with the Ultramontane party, and ever after displayed a marked hostility to the freedom of the press, and all projects of electoral reform. Raised to the peerage by Louis XVIII in 1823, he retired, under the next dynasty, to Monna, where he died 23d November 1840. His most important writings are: *Législation Primitive* (3 vols. 1802), and *Recherches Philosophiques* (2 vols. 1818), which have been immensely applauded by his own party, but are most remarkable for weak logic, historical inaccuracy, and unreasonable devotion to the pope and the Jesuits. A complete edition of his works in 12 volumes was published under his own supervision (1817-19).—His son, LOUIS JACQUES MAURICE (1787-1870), became Archbishop of Lyons in 1839, and a cardinal in 1841.

Bonanza (Span., 'a fair wind,' 'prosperity'), a term originally applied in the mining territories of the United States to the discovery of a rich vein or 'pocket'; a mine was said to be *in bonanza* when producing profitable ore. It has since been used colloquially of farms where steam is employed, or of successful enterprises generally, in the sense of a 'mine of wealth.'

Bonaparte (pronounced in Ital. in four syllables; in Fr. and Eng. in three) is the name of a

famous family, and was spelt *Buonaparte* by the Emperor Napoleon and his father till 1796, though the more usual modern form also occurs in old Italian documents. In the 13th century and afterwards, several families named Bonaparte figure with distinction in Italian records—at Florence, San Miniato, Sarzano, and Genoa. But as the name of Bonaparte occurs in Corsica so early as the 10th century, it is probable that the island may have been their original home. In the 16th century we again find mention of the Bonapartes in Corsica, where in Ajaccio they occupied a respectable position as a patrician or leading family. In the 18th century this family was represented by three male descendants, all residing at Ajaccio: the archdeacon, Lucien Bonaparte; his brother, Napoleon Bonaparte; and their nephew, Charles.—**CHARLES BONAPARTE**, father of the Emperor Napoleon, was born at Ajaccio in 1746; studied law at Pisa; and married in 1767—without the consent of his uncles—a beautiful young patrician lady, named Letizia Ramolino. In 1768 he removed with his family to Corte, in order to assist General Paoli in defending the island against the French invasion. As the French prevailed, and further resistance was useless, Charles Bonaparte attached himself to the French interest, and in 1771 was included by Louis XV. in the election of 400 Corsican families to form a nobility. In 1773 Charles Bonaparte was appointed royal counsellor and assessor of the town and province of Ajaccio. In 1777 he was a member of the deputation of Corsican nobles to the court of France. In this capacity he resided for some time in Paris, where he gained for his son Napoleon, through the interest of Count Marboëuf, a free admission into the military school at Brienne. In 1779 he returned to Corsica, and in 1785 went to Montpellier for the benefit of his health, where he died the same year. He was a man of noble presence and amiable character. By his marriage with Letizia he left eight children: Joseph Bonaparte, king of Spain; Napoleon (q.v.), emperor of the French; Lucien Bonaparte, Prince of Canino; Marianne Elisa, Princess of Lucca and Piombino, wife of Prince Bacciocchi; Louis Bonaparte, king of Holland; Marie Pauline, married at seventeen to General Leclerc (who died of yellow fever in the West Indies), afterwards Princess Borghese; Maria Annunziata Caroline, who married Murat, king of Naples; Jerome Bonaparte, king of Westphalia. These members of the Bonaparte family, with the children of Beauharnais (q.v.), adopted by the Emperor Napoleon when he married Josephine, are distinguished as the *Napoleonicæ* of modern French history. By a decree of the Senate (1804), the right of succession to the throne was restricted to Napoleon and his brothers Joseph and Louis, with their offspring. Lucien and Jerome were excluded on account of their unequal marriages. As Joseph, the eldest brother of the emperor, had no son, the descendants of Louis became nearest heirs to the throne.—**MARIA LETIZIA RAMOLINO**, mother of Napoleon I., lived to see her family placed on the thrones of Europe, and also witnessed their downfall. She was born at Ajaccio in 1750. After the death of her husband she lived for some time in Corsica, and in 1793, when the island came under British rule, removed with her family to Marseilles, where she lived in poverty, mainly supported by the pension given to Corsican refugees. After her son became First Consul she removed to Paris, and when her son was crowned in 1804 received the title Madame Mere, and was made patroness of all the benevolent institutions of the empire. A brilliant court-household was given to her, which, however, was never pleasing to her modest tastes.

Remembering former adversities, and foreboding reverses of the splendid success of her sons, she was prepared for all that followed. After the downfall of Napoleon, Letizia lived with her step-brother, Cardinal Fesch, in winter at Rome, and in summer at Albano, and submitted to her change of fortune with remarkable dignity. She died in 1836, leaving a considerable property, the result of saving habits during her prosperity.

JOSEPH BONAPARTE, eldest brother of Napoleon, was born at Corte, in Corsica, in 1768. On the death of his father he exerted himself to support the younger members of the family, and in 1793 removed with them to Marseilles, where he prepared for the bar. In 1797 he was elected a member of the Council of Five Hundred, and in the same year was sent as ambassador from the republic to Rome. In 1800, after he had proved his ability in several offices of state, he was chosen by the First Consul as plenipotentiary to conclude a treaty of friendship with the United States of America. He signed the treaty of peace at Lunéville 1801, and that of Amiens 1802; and with Cretet and Bernier conducted the negotiations relative to the *concordat*. After the coronation of Napoleon new honours fell to the share of Joseph Bonaparte, who was made commander-in-chief of the army of Naples; in 1805, ruler of the Two Sicilies; and in 1806, king of Naples. Though, during his reign, many beneficial changes of government were effected, these reforms were not managed judiciously; and his humane feelings brought him into frequent collision with his imperious brother, a fact which did not conduce to the efficiency of his rule. In truth, he was far too fond of the fine arts to be a vigorous ruler in stormy times; and he is accused of leaving affairs too much in the hands of his minister, the subtle Salicetti. In 1808 Joseph Bonaparte was summarily transferred by his brother to the throne of Spain, and Murat took his place as king of Naples. For Joseph, this was no favourable change; he found himself unprepared to cope with the Spanish insurgents, and after the defeat of the French at Vittoria in 1813, he returned to his estate at Morfontaine, in France.

After the battle of Waterloo he accompanied Napoleon to Rochefort, whence they intended to sail separately for North America. In his last interview with Napoleon, Joseph generously offered to give up the vessel hired for his own escape, but meanwhile Napoleon had determined to surrender himself into the hands of the English. Joseph became an American citizen, and lived for some years at Bordentown, in New Jersey, U.S., where he employed himself in agriculture, and was highly esteemed by his neighbours. In 1832 he returned to Europe, and he died at Florence in 1844. Joseph was the only one of his brothers for whom Napoleon professed to care anything. He was a handsome, intelligent-looking man, distinguished by the elegance of his manners and conversation.—His wife, JULIA MARIE CLARY, born 1777, was the daughter of a wealthy citizen of Marseilles, and the sister-in-law of Bernadotte, king of Sweden. She was a quiet unambitious woman, with no taste for the splendours of royalty which fell to her share during a few weeks only at Naples, for she never went to Spain. Ill-health appears to have prevented her accompanying her husband to America. She died at Florence in 1845. By her marriage with Joseph Bonaparte she had two daughters.

LUCIEN BONAPARTE, Prince of Canino, and brother of Napoleon, was born at Ajaccio in 1775, and received his education in the college of Autun, the military school at Brienne, and the seminary at Aix. In 1798 he was made a member of the

Council of Five Hundred, and formed a party favourable to the views of his brother Napoleon. Shortly before the 18th Brumaire he was elected president of the Council of Five Hundred, and was the hero of that day. During the ferment which followed Napoleon's entrance, Lucien left his seat, mounted his horse, and riding through the ranks of the assembled troops, called upon them to rescue their general from assassins. Afterwards appointed Minister of the Interior, he was active in the encouragement of education, art, and science, and organised the prefectures. As ambassador to Madrid (1800) he contrived to gain the confidence of King Charles IV. and his favourite Godoy, and to undermine the British influence, which had until then been exercised at the court of Spain. Lucien was a republican in opinion, and therefore opposed to the absolute rule of his brother; and his second marriage to the widow of a stockbroker did not improve their relations. On condition that he would divorce his wife, the crowns of Italy and Spain were offered him; but he refused them, and preferred living in retirement at his estate of Canino, in the province of Viterbo, near the frontiers of Tuscany, where he devoted his time to art and science. Here he enjoyed the friendship of the pope, who created him Prince of Canino and Musignano; but having denounced in his private capacity the arrogant and cruel policy of his brother towards the court of Rome, he was 'advised' to leave the city in which he was at that period residing. In 1810 he took ship for America, but fell into the hands of the English. After the defeat at Waterloo, Lucien Bonaparte alone seems to have preserved his presence of mind. He immediately advised his brother to dissolve the chambers, and assume the place of absolute dictator. After the second ascent of the throne by Louis XVIII., Lucien lived in and near Rome, and died at Viterbo in 1840. He possessed considerable talents and firmness of character. He was in his early years a keen republican, but the weakness of the Directory convinced him that a military consulship was necessary to allay the social anarchy of France. He wrote poems of no particular merit. Lucien had a numerous family. By his first wife he had only two daughters. See Jung, *Lucien Bonaparte et ses Mémoires* (3 vols. 1882-83).

His eldest son was CHARLES LUCIEN JULES LAURENT BONAPARTE, Prince of Canino and Musignano, born at Paris in 1803. He never exhibited any inclination for political life, preferring the more quiet and wholesome pursuits of literature and science. He acquired a considerable reputation as a naturalist, and especially as a writer on ornithology. He died in 1857. He was a member of the principal academies of Europe and America. His chief publications are a continuation of Wilson's *Ornithology of America*, and the *Iconografia della Fauna Italiana*.—The second son, PAUL MARIE BONAPARTE, born in 1808, took a part in the Greek war of liberation, and died by the accidental discharge of a pistol in 1827.—The third son, LOUIS LUCIEN BONAPARTE, born in 1813, at Thorn Grove, Worcestershire, during his father's imprisonment in England, early devoted himself with equal ardour to chemistry, mineralogy, and the study of languages, and became an authority of the first rank in Basque, Celtic, and comparative philology generally. His election for Corsica in 1848 was annulled, but he was sent to the Constituent Assembly for the Seine department next year, and was made senator in 1852, with the title of highness in addition to that of prince which he already possessed from his birth. Most of his contributions to linguistic science have been privately printed, and, according to a *Catalogue* (8 parts, 1858-88), the total number of separate

books written either by himself or at his instigation and encouragement, amounted to no less than two hundred and twenty-two. Amongst these are a translation of St Matthew's version of the parable of the sower into *seventy-two* languages and dialects of Europe (1857); a linguistic map of the seven Basque provinces, showing the delimitation of the 'Euscara' and its division into dialects, sub-dialects, and varieties (1863); a Basque version of the Bible in the Labourdin dialect (1865); a masterly treatise on the Basque verb (1869); besides many papers in the philological journals. Under his patronage from 1858 to 1860 a version of the Song of Solomon was produced in twenty-two English dialects, besides four in Lowland Scots. For long he lived in England, where a Civil List pension of £250 was granted to him in 1833. He died at Fano, on the Adriatic, 3d November 1891.—The fourth son, PIERRE NAPOLEON BONAPARTE, born in 1815, passed through many changes of fortune in America, Italy, and Belgium, and returned to France in 1848. In 1870 he shot a journalist, Victor Noir, a deed which created great excitement in Paris; and being tried, was acquitted of the charge of murder, but condemned to pay £1000 to Victor Noir's relatives. He died in 1881.—The youngest son, ANTOINE BONAPARTE, born in 1816, fled to America after an affair with the papal troops in 1836, and returned to France in 1848, where he was elected to the National Assembly in 1849; he died in 1883.

LOUIS BONAPARTE, third brother of Napoleon, born in 1778, was educated in the artillery school at Châlons, where he imbibed anti-republican principles. After rising from one honour to another he was made king of Holland in 1806; but, in fact, was never more than a French governor of Holland, subordinate to the will of his brother. Yet he seems to have done his best to govern in the interests of his Dutch subjects, and when he found his efforts useless, he resigned in favour of his son in 1810. He returned to Paris in 1814, where he was coldly received by the emperor. After living for some years in Rome—where he separated from his wife—he removed in 1826 to Florence, where he lived in retirement. He died at Leghorn in 1846. Louis Bonaparte was the writer of several works: *Marie, ou les Hollandaises* (1814), a novel, giving sketches of Dutch manners; *Documents Historiques, etc. sur le Gouvernement de la Hollande* (3 vols. Lond. 1821); *Histoire du Parlement Anglais* (1820); and a critique on M. de Norvins's *History of Napoleon*. Louis Bonaparte was married in 1802 to Hortense Beauharnais, daughter of General Beauharnais (q.v.) by his wife Josephine, afterwards empress of the French.

The amiable and accomplished HORTENSE EUGÈNE BEAUHARNAIS, the adopted daughter of Napoleon, queen of Holland and Countess St Leu, was born at Paris in 1783. After the execution of her father, she lived for some time in humble circumstances, until Napoleon's marriage with Josephine. In obedience to the plans of her step-father she rejected her intended husband, General Dessaix, and married Louis Bonaparte in 1802. She lived mostly apart from her husband, even as queen of Holland; and on the downfall of the Napoleons, passed her time in various countries. She at last settled at Arenenberg, a mansion in the canton Thurgau, Switzerland, where she lived in retirement, sometimes spending a winter in Italy. In 1831, when her two sons had implicated themselves in the Italian insurrection, the countess travelled in search of them through many dangers, and found the elder deceased, and the younger, the late emperor of the French, ill at a place near Ancona. She died at Arenen-

berg in 1837, and was buried near the remains of her mother, Josephine, at Ruel, near Paris. She was the authoress of *La Reine Hortense en Italie, en France, et en Angleterre, pendant l'année 1831*, and wrote several excellent songs. She likewise composed some deservedly popular airs; among others the well-known *Partant pour la Syrie*, which the late emperor of the French, with a delicate union of political tact and filial pride, made the national air of France. Of her three sons, the eldest, NAPOLEON LOUIS CHARLES, born 1803, died in childhood in 1807.—The second, LOUIS NAPOLEON, born 1804, crown prince of Holland, married his cousin Charlotte, daughter of Joseph Bonaparte, and died in 1831.—The third, CHARLES LOUIS NAPOLEON, became emperor of the French. See NAPOLEON III.

JEROME BONAPARTE, youngest brother of Napoleon, was born at Ajaccio in 1784. After receiving his education in the college at Juilly, he served as naval lieutenant in the expedition to Hayti. When war broke out between France and England in 1803, Jerome was visiting Martinique. Refusing to return to Europe, he proceeded to Washington and Baltimore. While in America he married Elizabeth Patterson (1785-1879), daughter of a merchant in Baltimore. He fought in the war against Prussia, and in 1807 was made king of Westphalia. His administration of his kingdom was careless, extravagant, and burdensome to his subjects. The battle of Leipzig brought the reign of Jerome to a close. He fought by the side of the emperor at Waterloo. After his brother's abdication he left Paris and visited Switzerland and Austria, but ultimately settled in Florence. At the outbreak of the February revolution (1848) Jerome Bonaparte was in Paris, where he was appointed governor of the Invalides, and in 1850 was made a French marshal. He died in 1860.

His marriage with Elizabeth Patterson having been declared null by Napoleon, a marriage with Catherine, daughter of King Frederick I. of Wurttemberg, was arranged as a prelude to the creation of the kingdom of Westphalia. After Waterloo, her father wished to annul it; but she declared her resolution to share through life the fortunes of her husband. Jerome Bonaparte had by his first marriage one son, Jerome Napoleon (1805-70), a wealthy American citizen, father of Roosevelt's attorney-general, the Hon. Charles Bonaparte (1851-1921). By his second wife he had three children.—The elder son, JEROME BONAPARTE, born 1814, died in 1847.—MATHILDE BONAPARTE, Princess of Montfort (1820-1904), born at Trieste, married the Russian Count Anatol Demidov, and lived at the court of Louis Napoleon during his presidency.—The younger son, NAPOLEON JOSEPH CHARLES PAUL BONAPARTE, born at Trieste in 1822, passed his youth in Italy; entered the military service of Wurttemberg in 1837; afterwards travelled in several countries of Europe; and was banished from France (1845) on account of his intercourse with the Republican party. After February 1848 he was elected into the Legislative National Assembly. He commanded an infantry division at the battles of Alma and Inkermann. In 1859 he married the Princess Clotilde, daughter of Victor Emmanuel, by whom he had two sons and a daughter. After the fall of the empire he took up his residence in England, but returned to France in 1872. On the death of the Prince Imperial, son of the Emperor Louis Napoleon, in Zululand in 1879, the eldest son of Prince Napoleon became the heir of the Bonapartist hopes. When, in 1886, the chiefs of the Bourbon family were expelled from France, Prince Napoleon and his eldest son were exiled also as pretenders to the throne. He died at Rome, 17th March 1891. See

NAPOLEON, NAPOLEON III., MORNAY, and works cited at those articles: books on the Bonapartes by Wouters, Gregorovius (trans. 1855), Leynadier, Du Casse, Williams and Lester; the Memoirs of

Lucien and Jerome; Larrey, *Madame Mere* (1892); Bingham, *The Marriages of the Bonapartes* (1881); H. Atteridge, *Napoleon's Brothers* (1909); I. A. Taylor, *Queen Hortense and her Friends* (1907).

Charles Bonaparte.

Bonar, HORATIUS, born in Edinburgh, 19th December 1808, and educated at the High School and university there, was in 1837 ordained at Kelso, where at first as parish minister, and after 1843 as minister of the Free Church, he remained for nearly thirty years, when he was translated to a Free church in Edinburgh. For a time editor of the *Christian Treasury* and other religious serials, he published besides some twenty volumes of sermons, devotional and biblical works. He is known to all English-speaking Christians as a hymn-writer—one of the very few Scottish authors whose hymns have found wide acceptance. Some of his *Hymns of Faith and Hope* (three series, 1857-66) are wonderfully perfect religious poems; and not a few are found in most collections in Britain, America, and the Colonies, such as 'I lay my sins on Jesus,' 'I heard the voice of Jesus say,' 'Thy way, not mine, O Lord,' 'A few more years shall roll.' He died 31st July 1889, and a *Memorial* was published the same year.

Bonasia, a genus or sub-genus of the Grouse family; see GROUSE.

Bonasmus, or BONASSUS. See BISON.

Bonaventura, ST, one of the most eminent Catholic theologians, whose real name was John of Fidenza, was born in 1221 at Bagnarea, in Tuscany. In 1243 he became a Franciscan monk; in 1253 a theological teacher at Paris, where he had studied; and in 1256 general of his order, which he governed strictly, but affectionately. His influence reconciled the differences which had sprung up among the cardinals on the death of Clement IV. in 1268, and procured the election of Gregory X. The new pope created him Bishop of Albano and cardinal in 1273, and insisted on his presence at the Council of Lyons, where he died, July 15, 1274, from sheer ascetic exhaustion. He was honoured with a splendid funeral, which was attended by the pope, the king, and all the cardinals.

On account of his unspotted character from earliest youth, as well as the miracles ascribed to him, he enjoyed, even during his lifetime, especial veneration. Dante, who wrote shortly after, places him among the saints of his *Paradiso*; in 1482 he was formally canonised by Sixtus IV.; and in 1587 was ranked by Sixtus V. as the sixth of the great doctors of the church. The religious fervour of his style procured for him the title of *Doctor Seraphicus*, and his own order are as proud of him as the Dominicans are of Thomas Aquinas. A great part of his writings is devoted to the praise of his order, and to the defence of Mariolatry, celibacy, transubstantiation, communion in one kind, and other doctrines and practices of the middle ages, which he attempts to deal with in a philosophical manner. His most important works are the *Breviloquium*, a text-book on dogmatics;

the *Itinerarium Mentis in Deum*, and *De Reductione Artium ad Theologiam*, in which he represents union with God as the highest good; and a commentary on the *Sententiae* of Peter the Lombard, in which he acutely argues against the eternity of the world, and also advances some original proofs of the immortality of the soul. He did more than any other of the early theologians to give a scientific form to the mystical theology. His *Biblia Pauperum*, or 'Poor Man's Bible,' is a mystico-allegoric explanation of the plain contents of the sacred books for the benefit of the laity. In warmth of religious feeling, however, and in the practical tendency of his ethics, he far excels the hair-splitting scholastics. There have been editions of St Bonaventura's works in 1588-96, 1864-71, and 1882-92. See the works on him by Hollenberg (1862), Richard, Borgognoni, Vicenza, Prosper, Skey (1889), Cherance (1899), and Costiloe and Conway (1911).

Bona Vista, a bay, cape, and town on the east coast of Newfoundland. The town is a port of entry, and one of the oldest settlements in the island. Pop. 4000.

Bonchamp, CHARLES, MARQUIS DE, one of the bravest of the Vendean leaders, was born at the château of Jouvertail, in Anjou, May 10, 1760. He served as a volunteer in the American revolutionary war, and was a captain in the French army at the outbreak of the French revolution. A strong royalist, he naturally disliked the revolution, and consequently lived in retirement until chosen leader of the Anjou insurgents. In conjunction with Larochejaquelein and Cathelineau he fought with great bravery and frequent success, but his superior knowledge of military tactics was not sufficiently made use of by the insurgent army. In the sanguinary encounter at Cholet, October 17, 1793, Bonchamp received a fatal shot in the breast, and when his followers vowed to revenge his death on five thousand republican prisoners, the dying hero exclaimed: 'Spare your prisoners. I command it.' This last command was obeyed.

Bond, in Law, is an instrument on stamped paper, by which the party granting it becomes bound to pay a sum of money, or perform any act or duty, according to the terms of agreement.

In England and the United States, a bond is said to be an instrument under seal, whereby one person becomes bound to another for the payment of a sum of money, or for the performance of any other act or thing. The person who is thus bound is called the obligor, and he to whom the bond is given, the obligee; and this obligation may be either by or to one or several persons. The bond may be unconditional simply for the payment of money, or it may be accompanied with a condition, the performance of which is secured by a penalty; but in any event, the debt

created by a bond is a *Specialty Debt*, which, however, has now no preference over simple debts, the only distinction being that a specialty debt takes twenty instead of six years to prescribe. See DEBT. A bond, being an instrument under seal, requires no consideration to support it. The acceptance of a bond for a simple contract debt causes the debt to merge in the bond.

The requisites of a good bond are as follows: (1) The bond must have an obligor and obligee. In regard to such parties, it is to be observed that in general no person who is under any legal disability to contract can become an obligor, though it is otherwise with an obligee. An infant cannot bind himself unless the bond be for necessities; but a bond may be given to an infant, a lunatic, or an alien. (2) The bond must oblige the obligor to pay a definite sum of money on a specified day, or on the happening of a specified event. Formerly, on forfeiture of the bond, the whole penalty stipulated was recoverable at law. But now, in the case of a bond conditioned for payment of money, the obligee cannot recover more than the principal sum due, with interest and costs. So in the case of a bond conditioned for the performance of any written agreement, the obligee cannot take out execution to a larger amount than the damages actually sustained by him, with costs. (3) A bond must be so expressed as to create a clear legal obligation. But for this purpose no particular form of words is necessary; any mode of expression by which the intention appears will suffice. (4) The bond must be duly executed. Such execution, in general, is the same as that of deeds, the sealing being the essential solemnity; and although it is usual for the obligor to sign the bond, his signature is not necessary to its validity. Then the bond must be delivered, but it need not be dated; a bond has even been held good though it bear a false or impossible date, on the principle that deeds take effect from, and have relation to, the time of their delivery.

In Scotland the bond—personal bond, as it is called—differs in several points of form from the English instrument. It takes the form of a probative written obligation, subscribed by the obligor in presence of two witnesses, but without sealing; it does not bear to be for double the sum due, or any sum other than the correct one, which it states with precision, with a penalty, which is usually one-fifth of the principal sum; and it must be very specific in all its details. As in English practice, there are in Scotland two kinds of these instruments: first, bonds for money simply; and, secondly, bonds for the performance and accomplishment of some act, or, as they are called in the Scots practice, bonds *ad facta præstanda*. The Scottish bond takes forty years to prescribe. It is always registered in order that summary diligence may pass upon it. The penalty covers only the actual loss and expenses incurred by the creditor through the debtor's default.

A mortgage over land or other real estate is also in Scotland in the form of a bond, by which name, indeed, the mortgage is technically described. Thus, the ordinary form of heritable security in modern practice is the *bond and disposition in security*. By these mortgage bonds the borrower not only becomes personally bound in the repayment of the loan, but 'in further security and more sure payment' he also conveys to the lender the land, or other real property, itself, on which the sum is to be made a charge, with, in a certain event and under certain conditions, a power of sale, by means of which the creditor, on the debtor's default, may recover his money. The transmission of, and succession to, these securities are regulated chiefly by the Titles to Land (Scotland) Act, 1868, and

the powers of the bondholder by the Heritable Securities Act, 1894. There are in England bonds by which expectant heirs may operate on their reversions, and these are called *Post-obit bonds* (see POST-OBIT). The English law as to sales of reversionary interests was declared by statute in 1868 (see REVERSION). The name bond is also applied to many securities or instruments embodying obligations, issued by governments, companies, or local authorities, whether strictly in the form of an ordinary bond or not; many such bonds are taken payable 'to bearer,' and are recognised as negotiable instruments. See also articles on DEBENTURE, LLOYD'S BONDS.

According to the law of both countries and the United States, certain bonds are void, such as a bond conditioned either to do something which the law considers wrong in itself, or which is legally prohibited, or to omit doing something which is a duty, or to encourage the performance of anything which is in the nature of a crime or offence against the law. In like manner, bonds to procure marriage, called marriage brokerage bonds, or to restrain marriage, or for immoral considerations, or in restraint of trade, are void. A bond, however, may be valid in part, or void in part, if such parts are separable. Joint and several bonds are the bonds of two or more obligors who bind themselves severally and jointly: if one pays the entire debt he is entitled to contribution from the other obligors. See BROUAGE BONDS, MORTGAGE, SPECIALTY DEBT.

BLANK BONDS were Scots securities, in which the creditor's name was left blank, and which passed by mere delivery, the bearer or holder being at liberty to insert his name in the blank space, and sue for payment. The intention originally was to facilitate the transmission of the obligation; but, experience having proved that they were used for fraudulent purposes, these bonds were, by a Scottish act passed in 1696, declared void. The act, however, excepts from its provisions the notes of trading companies, and indorsements of bills of exchange. The Companies Act, 1907, sect. 106, enacts that, notwithstanding the act of 1696, debentures to bearer issued in Scotland are valid and binding according to their terms.

BOND OF CORROBORATION is an additional obligation by the debtor in a bond to accumulate arrears of interest, or to cure some defect, or granted to the heir of the creditor to save the expense of making up a title. It used to be granted by the heir of the debtor, but since 1874 this has been rendered unnecessary by statute.

BOND OF CAUTION is the obligation given by guarantors for the faithful discharge of duty by judicial factors or other persons, or for the due payment of a debt by the debtor (see CAUTION).

BOND CREDITOR, in England, is the name sometimes given to a creditor whose debt is secured by a bond.

INCOME BONDS are bonds, now frequently issued by corporations in the United States and elsewhere, the interest of which is payable only when it is earned, and after the interest upon prior mortgages has been duly paid.

GENERAL MORTGAGE BONDS are bonds secured upon the entire property of a corporation, parts of which are already subject to one or more mortgages.

Bond, Sir EDWARD AUGUSTUS, born at Hantswell, 31st December 1815, entered the British Museum in 1838, became keeper of the MSS., and in 1878-88 was head librarian. He published catalogues of MSS. and fac-similes of Anglo-Saxon charters in the library; and, among other works, he edited the *Statutes of Oxford University* (1853), *Fletcher's Russe Commonwealth* and *Horsley's Travels in Russia in the 16th Century* (1856) for the Hakluyt

Society, *Speeches in the Trial of Warren Hastings* (4 vols. 1859-61), and *Chronica Monasterii de Melsa* or *Meaux* (Rolls Ser. 3 vols. 1866-68). He also helped to edit the *Fac-similes* published by the Palæographic Society, of which he was a founder and president. He died 2d January 1898.

Bond, WILLIAM CRANCH, an American astronomer, born 19th September 1789, at Portland, Maine, became a watchmaker, and erected one of the first private observatories in the United States. In 1838 he accompanied the exploring expedition sent by government to the South Sea, and in 1840 he became director of the observatory at Harvard University. Here he and his son, George Phillips Bond (1826-65), discovered (simultaneously with W. Lassell) the eighth satellite of Saturn. He died 29th January 1859.

Bondager, the term applied in the south of Scotland and in Northumberland to a female labourer whom a 'hind' or married farm-worker undertakes to supply for the regular field-work on a farm as a condition of his tenancy of his cot-house. She is frequently a member of his own family, or she may be merely engaged and boarded by him. The origin of the bondager system is the want of a sufficient rural population for the field-work of the neighbourhood.

Bonded Warehouses. The warehousing system is a plan for lessening the pressure of excise or customs duties by postponing payment of them until the goods on which they are levied pass to the consumer, or, at all events, to the retail dealer. A merchant who might import £1000 worth of wine or tobacco if he only paid duty on it by instalments as it went out to the dealer, would be quite unable to import so much if he had to pay heavy duty immediately upon the arrival of his goods. Hence the adoption of the bonded warehouse or warehousing system, which also affords to merchants facilities for free exportation. The taxable commodity is locked up in a 'bonded' warehouse, which has been approved by the Commissioners of Customs or of Inland Revenue. It is under the supervision of the revenue officers from the time it is entered into until it is finally cleared out of the warehouse, and the revenue is further protected by bond given for due exportation or for payment of duty. This bond was formerly entered into by the importer, but the security is now given by the warehouse-keeper. 'Bonding' was part of the scheme of Sir Robert Walpole in 1733, generally known as the 'Excise Scheme,' which was defeated, however, on account of its unpopularity. The system was first authorised for the customs by an Act of George III. in 1802. The excise system of warehousing dates from 1823. In successive years various acts and departmental regulations have been issued, extending or defining the privileges, and in 1882 the excise and customs systems were assimilated, the new code adopting excise methods to a considerable extent. While in the warehouse 'wet' goods—i.e. wines and spirits—may be operated upon by racking, blending, mixing, sweetening, and colouring, under strictly defined conditions. Wines may be refined and fortified. No compensation can be made by the Customs or Inland Revenue authorities to any importer or proprietor of goods by reason of any damage occasioned in the warehouse by fire or any other accident. The warehousing system has also, by retaining the goods for the owner, whoever he may be, created a complete system of paper-money in the transference of the title-deeds, as they may be called, of such goods—the dock-warrants or other documents—the possession of which is equivalent to possession of the goods.

Bondi, CLEMENTE, an Italian poet, was born 27th June 1742 at Mezzano, in Parma. He was educated by the Jesuits, and when still very young, was appointed to deliver lectures on rhetoric in the Royal Convent at Parma. Here he produced his first work, *Giornata Villereccia* (1773), a comic picture of the rural pleasures of the brotherhood. For having celebrated in verse the abolition of the Jesuit order, he was compelled to fly to the Tyrol; and after his return he lived at Venice, at Mantua, and at Milan, where he found a patron in the Austrian Archduke Ferdinand, who appointed him his librarian at Brunn. Later he lived at Vienna, where he died on 20th June 1821. His poems are lyrical, descriptive, satirical, and elegiac, written in pure style and graceful verse.

Bondu, a country of Senegal, West Africa, to the W. of Bambouk, lying between 14° and 15° N. lat. and 12° and 13° W. long. The surface of Bondu is mostly level, the climate healthy, and vegetation luxuriant alike in field and forest. Gold and iron are found, and cotton fabrics woven. The inhabitants, who are chiefly Fula, profess Mohammedanism. When Park, the first European to visit Bondu, was in the country, the royal residence was at Fattécondia; since, it has been removed to Bulibani, a place of 3000 inhabitants, on the principal river, the Falemé. The country is now a French dependency. Pop. 30,000—50,000.

Bone is the hard material of the skeleton of mammalian animals, reptiles, birds, and certain fishes. When the different bones of the skeleton are connected together, they form a framework which affords support to soft parts, and protects delicate organs from injury, while at the same time preserving the shape of the body. Further, the bones, being movably joined to each other, and being acted upon by the attached muscles, become a series of levers capable of executing various movements, and thus, in the case of the bones of the lower extremity, they are the passive instruments of locomotion. In colour, bone is white, but in the living body it has in addition a pink and slightly bluish tint. Besides being *hard*, it possesses a certain amount of *toughness* and *elasticity*, properties which are well marked in the ribs and clavicle. Arab children are said to make good bows of the ribs of camels, and the elasticity of the merrythought—i.e. united clavicles—of birds is familiar to all. Its strength is remarkable as contrasted with other substances:

Fine Freestone.....	1.0
Lead.....	6.5
Elm and Ash.....	8.5
Box, Yew, Oak.....	11.0
Bone.....	22.0

We thus see that bone is twice as strong as oak, and a cubic inch of bone will support a weight of 5000 lb.

Chemical Composition of Bone.—It consists of an animal and an earthy part intimately combined together. The following table shows a percentage analysis of adult human bones by Berzelius:

Animal Matter.....	33.30
Phosphate of Lime.....	51.04
Carbonate of Lime.....	11.30
Fluoride of Calcium.....	2.00
Phosphate of Magnesium.....	1.16
Soda and Chloride of Sodium (Common Salt).....	1.20
	100.00

If we expose a bone to intense heat, the animal matter is got rid of, and though the bone retains its original form, yet the slightest touch will cause its now unsupported earthy matter to crumble away. On the other hand, by soaking a bone in diluted hydrochloric acid, the earthy matters are

gradually dissolved out, leaving a tough, somewhat transparent, flexible, and even elastic substance, which also retains the original figure of the bone in its most minute details. This residue is softer and more flexible than cartilage, and when boiled in water it is almost wholly resolved into *gelatin*, which *sets* or *gelatinises* on cooling. We see in the ill-nourished children of large towns too many examples of how necessary is the proper relation of these two elements of bone to each other. In the disease called rickets, the earthy matter is deficient, and the too flexible leg-bones bend under the weight of the trunk; in the aged person, again, the osseous substance being more densely packed with earthy matter becomes brittle, rendering them peculiarly liable to fractures.

Bones are classified according to their shapes—viz.: (1) *long*—e.g. thigh-bone and arm-bone; (2) *flat* or *plate-like*—e.g. shoulder-blade and bones of skull-cap; (3) *short* and *irregular* or *cubical*—e.g. those of the wrist or the vertebrae.

On making a section of a bone, it will be seen that the osseous substance is arranged differently in different parts, being either dense and close, and called *compact*, or open and reticulated, and called *spongy* or *cancellated*. There is, however, no abrupt limit between the two kinds, for they pass insensibly into each other. Again, in all bones the part next the surface is compact, and forms a shell or crust which contains the spongy texture within. Long bones have a shaft of compact substance with very little spongy tissue within, but at each end the spongy tissue predominates, having only a thin coating of compact substance, and thus the expanded rounded extremities enter into the formation of joints. Flat bones consist of two layers of hard tissue with intermediate spongy texture usually called *diploe*. Irregular bones are spongy throughout, with only a thin crust of compact substance. Close examination of cancellous tissue reveals the fact that it consists of numerous slender bars or lamellæ, which unite together to form an open lattice-work (cancelli), from which it takes its name. Considerable strength is thus obtained without undue weight; and it will be seen that the strongest lamellæ run in those directions which are naturally exposed to the greatest pressure. The following experiment will show that spongy tissue is able to sustain great weight in spite of its apparently fragile nature: A cubic inch of cancellous texture was taken from the lower end of the thigh-bone and placed with its principal layers upright. Four hundred-weight was then placed upon it, but it did not give way in the least; six hundredweight made it sink half an inch; yet the cubic inch of bone itself did not weigh more than fifty-four grains.

Compact bone is also full of holes which are very small and require a magnifying glass to examine them. If a transverse section be examined under the microscope, these round openings are seen to be the mouths of longitudinal canals named after Clopton Havers, an English physician and writer of the 17th century, who first specially directed attention to them—*Haversian Canals*. Blood-vessels run in them, and the widest also contain marrow. They vary in diameter from $\frac{1}{16}$ th to $\frac{1}{8}$ th of an inch. They are short, and unite freely with each other. Those nearer the circumference open on the surface by minute pores; those placed deeply communicate freely with the spaces in the spongy tissue, so that they form an extensive network of tubes in which blood-vessels are lodged.

Each canal is surrounded by a series of concentric rings, each of which is a layer of condensed structure. Between these rings minute cavities are found, called *lacunæ*, generally oval in man. These communicate with each other and with the

Haversian canal in the centre by means of fine pores or tubes called *canaliculi*, and thus it is evident that nutrient material can pass from the

Transverse Section of Compact Tissue of Humerus, magnified about 110 diameters. (From Quain.)

Haversian canal through the rings of dense bone which surround it, and which with the lacunæ and canaliculi are grouped together under the name of a Haversian system.

Bone is covered externally by a fibrous membrane which adheres very closely, investing every part of the surface except where there is cartilage, and called the *periosteum*. In this membrane fine vessels and nerves ramify, ultimately sending their minute branches into the Haversian canals. If the periosteum should be stripped off, there is great risk that the denuded portion of bone will be deprived of its nourishment and die.

The interior of the shaft of long bones is hollow, and thus we get a further combination of strength and lightness. In some animals this hollow space is filled with air, but in mammals there are no air-spaces in any bones except those of the head. The hollow shaft is therefore filled with *marrow* (medulla), which occupies the spaces of the spongy bone, and even extends into the widest Haversian canals. Lining the medullary canal there is a fine membrane named the *internal periosteum*. Its vessels partly supply the bone and partly the marrow. In long bones the marrow is like ordinary Adipose Tissue (q.v.), but in short bones and in cancellated tissues generally the marrow is more fluid, contains fewer fat-cells, and is red in colour.

In addition to the blood supplied to the bone through the vessels in the periosteum, one of considerable size, called the *medullary artery*, enters the canal containing the marrow by a hole running obliquely through the dense bone. Complete anastomosis takes place between the arteries on the surface and those in the interior of the bone. As has been stated, nerves enter the bone, but how they terminate is uncertain; and experiments seem to show that healthy bone is almost devoid of sensibility, while, on the other hand, the pain of an inflamed bone is extreme. In its earliest stages, bone may be said to exist as a mass of cells having the outward form but none of the characters of bone. Soon, however, these cells become cartilaginous, and in due time points or *centres of ossification* appear; the cells alter their form and arrangement, and by a deposit of earthy materials the bony tissue gradually becomes formed, rendering the previously flexible substance rigid. However, bone does not form in cartilage in every instance, for the bones of the face and skull-cap arise in connective tissue. Hence we have two great modes of ossification—viz. *intra-cartilaginous* and *intra-membraneous*.

The uses to which a bone may be put are various. In the cooking of soups, bones form a constant ingredient, and become useful in supplying gelatin, which gives a *body* to the soup it would not otherwise possess. Even when buried, the organic matter is long retained—e.g. Gimbernat made soup from the gelatin of a mastodon's tooth, and Dr Buckland did the same from the fossil bones of the hyena. Where the soup is required of great lightness, for an invalid with weak digestive powers, the shavings of stags' horns may be employed, and these yield a *hartshorn jelly* free from oil, and therefore sitting lightly upon the stomach. How far gelatin is of itself nutritious is a disputed question (see articles GELATIN, FOOD). Animals, however, like the dog, which masticate, devour, and digest the entire bone, do derive benefit therefrom, in part from the gelatin, and in part from the earthy substances; and the same remark applies to the use sometimes made of small fish, where, after being thoroughly browned, they are entirely eaten. In times of scarcity in Norway and Sweden, the poorer people even eat the bones of mackerel and other fish.

Bone is largely used in making the handles of small brushes, table-knives and forks, and pen-knives, and in the manufacture of Combs (q.v.). Our forefathers, before the metals were known, fashioned fish-hooks out of bone, and used the spines in the tail and back-fin of certain fishes for pointing arrows. These uses of bone, coupled with the employment of the serrated teeth of sharks as a war-weapon, are still practised by many uncivilised tribes. The fatty and other organic matters in bone allow of its being employed as a fuel where coal or wood cannot be obtained, as in the pampas of South America and the steppes of Tartary. In these regions it is considered that the heat evolved during the combustion of the bones of an ox suffices to cook the flesh.

Bone is likewise serviceable in the arts in yielding bone-ash, bone-black, bone-dust, dissolved bones, phosphorus, and superphosphates, also certain oils and fats, which are employed in forming Lampblack (q.v.), and in making soap and glue. Bone may suffer from atrophy, hypertrophy, or degeneration (see RICKETS), often from constitutional affections due to Scrofula or Syphilis (q.v.); Caries and Necrosis (q.v.) are specific bone diseases; inflammation of the bone causes Ostitis; of the periosteum, Periostitis (q.v.); of the medulla, Osteo-myelitis. For ossification of arteries, see ARTERIES, TUMOUR; and for broken bones, FRACTURE. Various matters connected with the bones will be found at ANATOMY, ARM, BIRDS, COLLAR-BONE, FOOD, HAND, JOINTS, OSSIFICATION, RIBS, SKELETON, SPINAL COLUMN, &c.

Bône, a city. See BONA.

Bone, HENRY, enamel-painter, was born at Truro, Cornwall, 6th February 1755. Apprenticed to a Plymouth china-manufacturer, he removed with his master the year after to Bristol, and here he worked for six years at the famous Bristol china-works until their failure drove him to London to push his fortune. He soon found employment in enamelling watches and fans, and afterwards in making enamel portraits, brooches, &c. A portrait of his wife, exhibited at the Royal Academy in 1780, first attracted public attention; and he soon obtained a position which rendered it no longer necessary for him to continue his drudgery for the jewellers. In 1801 he was appointed enamel-painter to George III., and elected associate of the Royal Academy. Elected R.A. in 1811, he exhibited in that year his large enamel, 'Bacchus and Ariadne,' after Titian, which was sold for 2200 guineas, and is now in the National Gallery. From

this time, until his eyesight failed in 1831, he produced a series of large and beautiful works, among them the well-known 'Death of Dido,' and 'Hope Nursing Love,' after Sir J. Reynolds. He also executed a large number of historical portraits of the time of Elizabeth, besides a series of portraits of the Russell family. He died December 17, 1834. His works are now eagerly sought after by collectors, and are esteemed among the very best examples of his particular art.

Bone-ash, or BONE-EARTH, is obtained by the complete combustion of bones in an open furnace, when the oxygen of the air burns away the organic matter or gelatin, and leaves the earthy constituents as a white friable mass, the size of the original bone, but readily reducible to the condition of coarse powder which is bone-ash. A very large quantity of bone-ash is exported from South America to other countries, especially Britain. The used-up bone-black of the sugar-refiner is also employed as a source of bone-ash, by being heated in a furnace exposed to the air. Bone-ash of good quality contains about 80 per cent. of phosphate of lime, and 20 per cent. of carbonate of lime, phosphate of magnesia, soda, and chloride of sodium (common salt); but it is occasionally found mixed with sand, especially that procured from South America. Bone-ash is employed to some extent as a source of Phosphorus (q.v.), and in the making of cupels for the process of Assaying (q.v.); but the most extensive use is in the manufacture of artificial manures, such as dissolved bones and superphosphates (see BONE MANURES below).

Bone-beds, the name given by geologists to thin beds or layers which are largely made up of the debris of bones of reptiles, fish, &c. Examples are the Ludlow bone-bed of the Silurian, the Bettles bone-bed of the Bradford coal-measures, the Rhaetic bone-bed, and the Tilgate stone of the Wealden series. In the bone-beds of more recent geological age mammalian remains abound, as in the Suffolk bone-bed of the Coralline Crag.

Bone-black, the product of the carbonisation of bones, used as a pigment (see BLACK) and as a deodoriser. See CHARCOAL.

Bone Caves. See CAVES.

Bone Manures are applied to crops on account of the nitrogen—equivalent to 4 or 5 per cent. of ammonia—and the phosphate of lime which they contain—the latter amounting to nearly half their weight. Their value has only recently been discovered. The first crude bone-crushing machines were used in England in 1814. In Scotland, when bones began to be employed as manure, about 1825, they were roughly broken into large splinters with hammers by the farm-servants during wet weather, and 30 bushels applied per acre, at a cost of half-a-crown a bushel. Five hundredweight per acre is now considered a good dressing. Bones are not applied in good practice in a larger size than that of *meal* or *flour*—in other words, ground into a fine state of division.—*Rough Bones*, as quarter-inch size and larger, are now never used, as these lock up capital in the soil by taking too much time to decay, and do not give a remunerative return in comparison with manures that act quickly. Bones were sometimes formerly fermented to induce decay. They were piled in heaps, and water or urine poured over them. When the heat resulting from the fermentation went down, they were turned and watered again, and this kept up for a few months. Bones in an altered form are also used in making up concentrated manure, and are either ground or acted upon by sulphuric acid—for example:

(1) *Steamed Bone*, or degelatinised bone, results when bone is made friable and more easy of assimilation by plants through the action of superheated

steam (at 270°–280° F.) removing the fatty and gelatinous matter; but there is a loss of nitrogen in the process, as there is also in the preparation of ash and char.

(2) *Bone-ash* is the residue from bones burnt as fuel used in the 'rendering' of the fat of cattle in South America.

(3) *Bone-char* is made by heating in a close retort, and used largely for refining sugar before it goes for manure.

(4) *Vitriolised Bone* is a material only partially acted upon by acid—the result of a most wasteful practice deserving of condemnation, as destroying microbes which bring about nitrification in the soil.

(5) *Dissolved Bone* is bone broken into half-inch size, and then acted upon by sulphuric acid, so as to change a portion (about half) of the insoluble tribasic phosphate of lime into the soluble monobasic phosphate and the sulphate of lime; thus:

$\text{Ca}_3(\text{PO}_4)_2 + 2\text{H}_2\text{SO}_4 = \text{CaH}_4(\text{PO}_4)_2 + 2\text{CaSO}_4$.
Sulphuric acid is peculiarly suitable for this purpose as compared with, say, hydrochloric acid, as by the formation of sulphate of lime—or, in common language, plaster of Paris—a part of the moisture is absorbed, and the resulting material is left in a dry condition, which is essential for its proper distribution on the land. The object—extraordinary minuteness of division—is obtained, although the soluble condition disappears soon after its application to the soil; for the acid phosphate reacts with carbonate of lime in the soil, and the normal or tri-basic phosphate is precipitated. The dissolving of bones is now held to be wasteful because soluble phosphate of lime is procurable from many other cheaper sources. Liebig was the originator of the method in 1839, and during the next few years it was taken up by leading farmers in England and carried out as a farm operation. Now the work has fallen into the hands of manufacturers who can make it cheaper and, if they choose, better. Much adulteration has been practised in this trade at the expense of farmers. This was made possible owing to their ignorance and prejudices against learning anything scientific. Much manure sold as 'dissolved bone' is merely a mixture of soluble phosphate and some such nitrogenous material as nitrate of soda and sulphate of ammonia—the valuable substances being in the proportions present in bone. Soluble phosphate of lime, from whatever source, has a more beneficial influence on the turnip-crop than upon any other crop, because the turnip roots are not so able as the roots of other plants, such as wheat, to make use of the natural supply of phosphates existing in the soil in the insoluble form, even when this is abundant. Should the stock of phosphoric acid in the soil be reduced too far, the crop produce is reduced accordingly; it is necessary, therefore, to apply at least sufficient of this ingredient to make up for the loss resulting from the removal of the sale produce of a farm. The famous example of the deterioration of the Cheshire pastures on the rich soils of the new red sandstone by the yearly drain of phosphates through the sale of dairy produce, is now a matter of history. It is recorded that by the application of bones to these soils the value was doubled. Bone meal or flour is the most valuable form for application to thin, light, or hungry soils, as it decays in time to feed the growing crop, and is not liable to be washed out. In heavy land, ground bones are of little or no value—they get imbedded in the clay, and are preserved so that they cannot yield their substance to act as manure. On such soils the phosphate of lime should be used in the soluble form. Many thousands of tons of bones are annually imported from South America.

Boner, CHARLES (1815–70), born at Bath, became correspondent in Austria of the *Daily News*, translated much from German, and published books on chamois-hunting, on forest-creatures, and on Transylvania (1865), besides verses.

Boner, ULRICH, one of the oldest German fabulists, was a preaching friar of Bein, and is frequently mentioned in documents of 1324–49. His collection of a hundred fables was entitled *Der Edelstein*, and was first printed, with woodcuts, at Bamberg in 1461. An edition of 1757 supplied Lessing with materials for the study of fable. A critical edition by Pfeiffer appeared in 1844.

Boneset, a kind of Eupatorium (*E. perfoliatum*), also called Thoroughwort, is infused and employed in the United States as a domestic remedy for rheumatism, wounds, and influenza.

Bonesetters are a class of men who often possess a considerable local reputation for success in the treatment of injuries to the limbs, especially in cases where stiffness and pain have persisted long after an accident. They are usually uneducated men; and the knowledge they possess has been handed down by oral tradition, often for many generations and in the same family. Their chief method in the cases alluded to consists in effecting a sudden forcible movement of the affected part. As they are ignorant of anatomy, and of the signs of disease, they sometimes do immense harm by applying the method to unsuitable cases. But without doubt they have sometimes effected a cure where regular practitioners have failed. A detailed account of their methods, &c. was given to the medical profession by Dr Wharton Hood in a book *On Bonesetting* (1871). See DISLOCATION, FRACTURE.

Bo'ness, or BORROWSTOUNNESS, a seaport in Linlithgowshire, on the Firth of Forth, 23 miles WNW. of Edinburgh. A dingy place, it has a fine parish church (1886), a wet-dock of 7½ acres (1881), a large shipping trade in coal, and manufactures of salt, soap, malt, vitriol, iron, earthenware, &c. *Graham's Dyke*, otherwise Antoninus' Wall, traverses the parish. Dugald Stewart spent the last twenty years of his life at Kinnell House (Duke of Hamilton) in the neighbourhood. Pop. (1851) 2645; (1881) 5284; (1921) 10,162.

Bonfire, a fire kindled in celebration of some event of public interest, usually in an open conspicuous place, as the top of a hill, or the centre of a village-green, but applied also to any great blazing fire of whatever material. Such fires were especially lighted on certain anniversaries, as the eves of St John and St Peter, and their origin in our country may be traced to pre-Christian times. The Scots form *bane-fire* best shows the origin of the word—a fire for burning bones; Sir J. A. H. Murray noted that for the annual midsummer 'banefire' or 'bonfire' in the burgh of Hawick old bones were regularly collected and stored up down to about 1800. See BELTANE, BEACON, and vol. i. of Ellis's edition of Brand's *Popular Antiquities*.

Bongar, or ROCK-SNAKE (*Bungarus*), a genus of venomous serpents allied to the genera *Elaps* and *Naja*, and distinguished by the compressed body, which bears on the back a row of hexagonal scales larger than the rest. The head is broad and depressed; the tail is short. The species, which appear to be few—only two being certainly known—are natives of the East Indies. *B. caeruleus* (paragada) is very poisonous, and has a dark-blue ground colour, with narrow white lines in front, and cross rows of spots behind. *B. annularis* (pamah), also very poisonous, has black rings on a yellow ground, may be over 6 feet in length, and is found in Ceylon and China as well as in India.

Bongardia, a peculiar herbaceous genus of Berberideæ (q.v.). The only species (*B. Rauwolfii*), found from Greece to Central Asia, produces tubers, which are eaten, either boiled or roasted, in Persia; and the leaves have an acid taste, and are eaten as a salad.

Bongo, or OBONGO, are a Negroid people in the basin of the Ogowe (q.v.). Also a very shy African forest antelope, largest of the bushbucks.

Bonheur, ROSA, animal painter, born at Bordeaux, 16th March 1822. Her first master was her own father, Raymond Bonheur, an artist of merit, who died in 1853. In 1841 she figured for the first time in the Salon, showing a couple of small works—'Two Rabbits' and 'Goats and Sheep'—that indicated the department in which she was to attain future eminence. These were followed by a succession of highly finished compositions; the year 1849 producing what some consider her masterpiece, 'Ploughing with Oxen,' now in the Luxembourg. In 1853 her famous 'Horse Fair' was the principal attraction of the Salon; it was acquired for over £10,000 from the Stewart collection by Mr C. Vanderbilt, who presented it to the Gallery of New York. One of the two smaller replicas—that from which the well-known engraving was made—is in the National Gallery, London. In 1865 she exhibited a large landscape, 'Hay-making in Auvergne.' Rosa Bonheur long directed a School of Design for young girls. In 1853 she became entitled to the cross of the Legion of Honour, but because of her sex the decoration was withheld till 1865. During the siege of Paris (1870–71), her studio and residence at Fontainebleau were spared and respected by special order of the Crown Prince of Prussia. Her success in painting was largely due to conscientious study of living subjects; she succeeded in rendering spirited action in animals; and many of her works are known in England through engravings. She died 26th May 1899. See *Lives* by Laruelle (1885), Peyrol (1885), and Roger-Miles (1900), and Muther's *Modern Painting*.

Boni, a state on the east coast of the south-west peninsula of the island of Celebes, in the Pacific Ocean, with an estimated area of 935 sq. m. It was formerly the most powerful state in Celebes, but since 1859 has been practically a Dutch dependency. In the north the scenery is fine, and the soil fertile—rice, sago, and cassia being produced. The inhabitants, called Bugis, have an allied language to the Macassars, with a literature of their own. Their towns and villages dot the coast, and as enterprising merchants and sailors the Bugis are found in every port of the East Indian Archipelago; they also engage in agriculture and in the manufacture of cotton and articles of gold and iron, in which they have a large trade. They are well built, active, and brave, and are lighter skinned, as well as superior in honesty and morality to other Malay races. Their institutions, said to be very ancient, partake of the character of a constitutional monarchy. The British have twice attacked the Bonese for injuring their commerce, and selling the crews of British ships into slavery. In the second attack, in 1814, the Bonese king was killed. The number of the population is unknown; some estimates give as much as 200,000. The capital, called Boni, stands on the coast of the south-west peninsula.—The GULF OF BONI separates the south-east and south-west peninsulas of Celebes. It is 200 miles long, and 40–80 miles broad.

Boniface, the name of nine popes, most of whom are of no historic note.—Boniface I. (418–22) was the first who assumed as Bishop of Rome the title of First Bishop of Christendom.—Boniface III., who was pope only for ten months in the year 607,

was the first to whom the title of Universal Bishop of Christendom was conceded by the Greek Emperor (Phocas).—Boniface VIII., previously Benedict Cajetan, a native of Anagni, was elected pope in 1294. His inauguration was distinguished by great pomp: the kings of Hungary and Sicily held the reins of his horse as he proceeded to the Lateran, and with their crowns upon their heads, served him at table. His tenure of the Roman see was marked by the most strenuous assertion of papal authority. In a bull of 1302 he claimed to possess supreme power alike in temporal and spiritual affairs. He failed, however, in his attempts to assert a feudal superiority over Sicily, and to exercise his papal authority in the disputes between France and England. He sought without success to call Edward I. of England to account for his attempted conquest of Scotland. Philip the Fair of France, supported by his states and clergy, maintained the independence of the kingdom, disregarding many bulls and briefs, and even the sentence of excommunication to which the pope proceeded. Philip at last, with the aid of Italian enemies of Boniface, made him prisoner at Anagni, to which he had fled; and though he was liberated by the people of Anagni, he died at Rome soon afterwards in 1303. For his simony Dante has given him a place in the *Inferno* (canto xxvii.). He instituted the Roman jubilee in the year 1300, granting a plenary indulgence to all who should visit the sanctuaries of Rome in that year.—Boniface IX. (Peter Tomacelli), a native of Naples, succeeded Urban VI. as pope at Rome in 1389, whilst Clement VII. was pope at Avignon. He became notorious for his shameless sale of ecclesiastical offices and benefices, and of dispensations and indulgences. He acquired, after a struggle, a most despotic power in Rome. The annates, which had previously been an occasional payment, were by him made permanent in 1392. He died in 1404.

Boniface, a generic name for an innkeeper, like 'mine host' or 'landlord,' from the name of the jovial innkeeper in Farquhar's *Beaus' Stratagem* (1707).

Boniface, ST., 'the Apostle of Germany,' whose original name was Winfried, was born at Crediton, in Devonshire, about 680. He entered a Benedictine monastery in Exeter at the age of thirteen, and afterwards removed to that of Nursling, in Hampshire, where he taught rhetoric, history, and theology, and became a priest at the age of thirty. He seems to have adopted the name Boniface when he first turned monk. A movement, proceeding from England and Ireland, was still going on for the conversion of the heathen peoples of Europe; Gallus and Emmeran had been sent in 614 to Alemannia, Kilian (murdered 689) to Bavaria, Willibrord (died 696) to the country of the Franks, and Siegfried to Sweden. Winfried also took the resolution (716) of preaching Christianity to the Frisians, among whom it had not yet found entrance. But a war broke out between Charles Martel and the king of the Frisians, and Winfried returned from Utrecht to Nursling, of which he might have become abbot. But bent upon his design, he repaired to Rome in 718, and received the authorisation of Pope Gregory II. to preach the gospel to all the tribes of Germany. He went first to Thuringia and Bavaria, then laboured three years in Friesland, and travelled through Hesse and Saxony, everywhere baptising multitudes, and consecrating their idolatrous groves as churches. In 723 Gregory II. called him to Rome; consecrated him bishop, and furnished him with letters to Charles Martel and all princes and bishops, requesting their aid in his pious work. Returning to Hesse (724), he destroyed the objects of heathen

worship (among them the sacred oak of Geismar, which he cut down, and yet escaped the vengeance of the thunder-god), founded churches and convents, dealt strictly with immoral priests and bishops, heretics and Irish Christians who refused the Roman obedience, and called to his aid priests, monks, and nuns from England. Gregory III. sent him (732) the pallium, and named him archbishop and primate of all Germany, with power to establish bishoprics wherever he saw fit. Boniface now made a third journey to Rome (738), and was appointed papal legate for Germany. The bishoprics of Ratisbon, Erfurt, Paderborn, Wurzburg, Eichstadt, and Salzburg owe their establishment to St Boniface. The famous abbey of Fulda is also one of his foundations. In 746 he was chosen Archbishop of Mainz, and in 752 he is said to have consecrated Pepin as king of the Franks at Soissons. In 754 he resigned the archbishopric, and had resumed his apostolical labours among the Frisians, when at Dokkum, 18 miles north-east of Leeuwarden, in West Friesland, he was fallen upon by a band of armed heathens, and killed, along with the congregation of converts that were with him (5th June 755). His remains were taken first to Utrecht, then to Mainz, and finally to Fulda. In the abbey there is still shown a copy of the gospels written by him, with a leaf stained with his blood. A collection of his letters, and the canons he promulgated for the discipline of the newly-established churches, have been preserved, and are instructive as to the state of Germany at the time. The best editions of his Letters (*Epistolæ*) are those of Giles (2 vols. Lond. 1844), and Jaffé (Berlin, 1866), to which is appended the Life of him by Willibald. In 1811 a monument was erected to St Boniface on a hill near Altenberga, in the principality of Gotha, where, according to tradition, he had founded (724) the first Christian church in North Germany. A statue by Henschel was also erected to him at Fulda in 1842. See German works on Boniface by Seiters (1845), Muller (1870), Werner (1875), Fischer (1881), Ebrard (1882), and Kuhlmann (1895); also Merivale, *Conversion of the West: the Continental Teutons* (1878).

Bonifacio, STRAIT OF, the modern name of the strait between Corsica and Sardinia, the *Fretum Gallicum* of the Romans. At the narrowest part it is only 7 miles wide, and its navigation is difficult. The strait receives its name from the small fishing-town of Bonifacio in Corsica.

Bonifacius, Roman general and governor of Africa under Valentinian III., invited Genseric (q.v.) and his Vandals into the country, and died of wounds received in a duel with Aetius (q.v.).

Bonin', or (Japanese) OGASAWARA ISLANDS, a volcanic group in the Pacific Ocean, 700 miles SSE. of Japan, with an area of about 30 sq. m. Discovered by Tasman in 1639, they were taken possession of for Britain in 1827 by Captain Beechey; but in 1878 the Japanese reasserted their sovereignty with the view of making them a penal settlement. The harbour is named Port Lloyd.

Bonington, RICHARD PARKES, painter in oil and water-colours, was born at Arnold, near Nottingham, on 25th October 1802. His father, who had been governor of Nottingham prison, after many vicissitudes settled at Calais, where the son was placed under Louis Francia, the water-colour painter; and he afterwards studied in Paris—in the Louvre, at the Institute, and under Baron Gros. His water-colours sold rapidly. In 1822 he began to exhibit in the Salon, and received a premium from the Société des Amis des Arts for his views of Havre and Lillebonne; and two years later he was awarded a medal at the Salon, when Constable and Copley Fielding were similarly

decorated. He now occupied himself with lithography; many of his sketches were reproduced by this method in such works as Baron Taylor's *Voyages Pittoresques dans l'ancienne France*, and he occasionally drew upon the stone himself, from his own designs and those of other artists. A fine collection of his work of this kind is preserved in the print-room of the British Museum. About 1825 he took to oil-painting, and in that year visited England, accompanied by Delacroix, in whose studio he worked after his return to Paris; and having visited Italy, he produced his splendid Venice views of the 'Ducal Palace' and the 'Grand Canal,' which figured in the Salon of 1827, along with his 'Francis I. and the Queen of Navarre' and his 'Henry IV. receiving the Spanish Ambassador.' He also exhibited in the Royal Academy and the British Institution. His position was now fully established, and commissions came to him in plenty; but he caught an attack of brain-fever from exposure while sketching in the sun, and speedily fell into a decline. He visited London for medical advice, and died there, 23d September 1828. Of late years the fame of Bonington has been steadily increasing, and he is recognised as a most accomplished and original painter of landscape and architectural subjects, as well as of scenes of historical *genre*. He is especially admired for the purity and brilliancy of his colouring. His 'Henry IV. receiving the Spanish Ambassador' was bought by Lord Hertford for 83,000 francs; and his 'Grand Canal, Venice,' and the 'Fishmarket, Boulogne,' realised £3150 each at the Novar sale. The Louvre and National Gallery contain a number of his works, but Bonington is best represented in the Wallace collection. The Marquis of Lansdowne owns an important private collection. See *Richard Parkes Bonington: Life and Work*, by A. Duboussin (trans. 1924).

Bonito, a name common to several fishes of the mackerel family (*Scombridae*).—(1) One of these, *Thynnus pelamys*, sometimes called the

Bonito, or Stripe-bellied Tunny.

Stripe-bellied Tunny, and of the same genus with the Tunny (q.v.), is well known to sailors as an inhabitant of the tropical parts of the Atlantic and Indian Oceans, and as one of the fishes most frequently seen pursuing the flying-fish. It is often taken by an imitation flying-fish made to skim along and touch the waves. Its flesh is not regarded as very wholesome, though not unnaturally relished by those who have been previously confined to salt provisions. It is occasionally but rarely caught on the British coasts. It is a very beautiful fish, seldom exceeding 30 inches in length, of a beautiful steel-blue colour, darker on the back, and whitish below. Four dark lines extend along each side of the belly. The general form resembles that of the mackerel, but is less compressed.—(2) The Mediterranean Bonito (*Pelamys sarda*) is closely allied. It has the same blue back and dark transverse bars reaching from the dorsal ridge to the lateral line. It is plentiful in the Black Sea, and has been found in the North Sea. Its flesh is esteemed.—(3) The Plain Bonito (*Auaxis vulgaris* or *A. rochei*), found in the Mediterranean,

may be distinguished at once from both of these by its more uniform blue colour, without stripes or bands, and by the widely separated dorsal fins. Its flesh is little esteemed when fresh; it is generally used either salted or pickled. This fish has been occasionally caught on the coast of England, and even of Scotland.—The Sucking-fish (*Echeneis remora*), credited with retarding ships, the gorgeous John Dory (*Zeus faber*), the beautiful 'Dolphins' (*Coryphæna*), are allied genera of the same family. See MACKEREL.

Bonivard, FRANÇOIS DE, a younger son of a family which held large possessions under the House of Savoy, was born about 1496 at Seyssel, on the Rhone, and in 1513 became prior of St Victor at Geneva. Falling under the suspicion of the Duke of Savoy, he was taken prisoner by him in 1519. After twenty months' imprisonment he was set free, but in 1530 he was again seized, and taken to the castle of Chillon at the east end of the Lake of Geneva, where he was imprisoned for six years, the last four in that subterranean vault which the genius of Byron has made famous by his poem on the sufferings of *The Prisoner of Chillon*. The details of Bonivard's history were unknown to Byron; the highly wrought description of the prisoner 'chained to a column stone' sprang from the imagination of the poet, and is now embodied in the local tradition. On the capture of Chillon by the Bernese and Genevese in 1536, he was liberated, and returned to Geneva. The priory of St Victor had meanwhile been razed for the defence of the city, and the now Protestant government, having devoted its revenues to the hospital, awarded Bonivard a pension. He died in 1570, leaving the town his books, which were the nucleus of the Geneva library. In his *Chroniques de Genève* (1551; printed 1831; new ed. 1867) and *De l'Ancienne et Nouvelle Police de Genève* (1555) he paints in the blackest colours the opponents of the dominant Calvinist party. The credit of Bonivard, now usually spelt Bonnard, has not been tenderly dealt with by modern criticism; he seems to have been an unchaste and unfrocked monk and priest, a *bon vivant* and drinker, a fickle politician.

See works by Chaponnière (1846), Vulliamin (1863), Gaberel (1869); and Gribble's *Lake Geneva and its Literary Landmarks* (1901).

Bonn, a town of Rheinland, beautifully situated on the left bank of the Rhine (here 600 yards wide, and crossed by a fine bridge), 16 miles SSE. of Cologne, with which it is connected by a light railway as well as the ordinary main line. Bonn stands at the beginning of the fine scenery of the Rhine. The view of the Siebengebirge from the Alte Zoll is very beautiful. The Minster, said to have been founded by the Empress Helena in 320, but dating chiefly from the 11th and 13th centuries, has been restored since 1847. It is a good specimen of Romanesque and Transition, and has five towers, the middle one 311 feet high. Near the Minster is a monument to Beethoven, who was born in the Rheingasse (the birth-house now a Beethoven museum); and at Bonn are buried Niebuhr, Bunsen, and Schumann. Reinkens, the first Old Catholic bishop, made Bonn his residence. The university, founded in 1777–86, in 1802 was transformed into a lyceum, but was re-established in 1818, in the beautiful electoral palace (1717–30) and other buildings. There are five faculties—medical, legal, philosophical, and two theological (Protestant and Catholic). Among its professors have been Niebuhr, A. W. Schlegel, Arndt, Welcker, Dahlmann, Hermes, Argelander, and Simrock. It has a library of half a million volumes, a splendid laboratory (1868), an art museum (1884), archaeological and other collections, a botanic garden,

and an observatory; there is also a celebrated agricultural academy at Poppelsdorf, where are also some of the university institutes. The manufactures—jute, soap, chemicals, &c.—are unimportant. Pop. (1871) 26,030; (1919) 91,410, chiefly Catholic.—Bonn derives its origin from *Bonna*, one of the Roman stations in Germany. From 1273 till 1794 the residence of the Electors of Cologne, it was held by the French 1673–89; in 1703 surrendered to Marlborough; was acquired by France in 1801, and by Prussia in 1814.

Bonnat, LÉON JOSEPH FLORENTIN (1833–1922), born at Bayonne, studied at Madrid under Federico Madrazo, and in Paris under Léon Cogniet. He gained the second *Grand Prix de Rome*, and, aided by his friends, went to Italy in 1858, where he resided for four years. He was first brought into notice by his 'Adam and Eve finding the Body of Abel' (1860), now in the gallery at Lille; and his 'Pasqua Maria' (1863) was much praised. He devoted himself to Italian *genre* pictures of moderate size, varied by such religious subjects as 'The Assumption' (1869), and the terribly realistic 'Christ on the Cross' (1874), commissioned for the Palais de Justice, Paris. He produced many remarkable portraits, among others those of Thiers, Victor Hugo, Grévy, Pasteur, Dumas, Carnot, and Renan.

Bonner, EDMUND, Bishop of London, was born about 1500, of obscure and doubtful parentage. The reputation he gained at Oxford by his knowledge of canon law recommended him to the notice of Wolsey, who made him his chaplain, and promoted him to several benefices. His zeal in King Henry's service, after Wolsey's fall, earned him due promotion; and in 1533 he was deputed to appear before the pope at Marseilles, to appeal for the excommunicated monarch to a general council. His language on this occasion is said to have suggested to his holiness the fitness of having him burned alive, or thrown into a caldron of molten lead, so that Bonner judged it prudent to leave Marseilles without notice. In 1540 he was made Bishop of London, and as such pronounced sentence on several Protestant martyrs, though it is certain he did his best to befriend Anne Askew. After Edward VI.'s accession, he gave proofs of his lukewarmness in the cause of reformation, and at length, in 1549, was committed to the Marshalsea, and deprived of his bishopric. The accession of Queen Mary (1553) restored him to office; and by his part in that bloody persecution which has made her reign infamous, he rendered himself thoroughly unpopular. On Elizabeth's accession (1558), Bonner accompanied his episcopal brethren to salute her at Highgate, but was excepted from the honour of kissing her hand. In May 1559 he was summoned before the Privy-council, and refused, with a consistency worthy of respect, to take the oath of supremacy. He was accordingly deposed from his bishopric, and again imprisoned in the Marshalsea, where he died in 1569. The utmost allowance for Fox's exaggerations cannot free Bonner from the charge of persecution; though it seems that he did no more than his official position demanded, and that with such reluctance as to bring down on him the censure of the Privy-council. And one should not forget that he was strict in castigating the lax morality of his clergy, that he remained steadfast to his principles, and that he bore his final misfortunes with manly resignation. See *The Reformation in the 'Cambridge Modern History'* (vol. ii. 1904).

Bonnet, a covering for the head, of which there are many varieties. The French, from whom we have the word, apply it as we do to male as well as female head-dress. The *bonnet rouge*,

or 'cap of liberty' of the revolution, was shaped like a man's night-cap (*bonnet de nuit*). A felt cap of this shape, such as was worn by the Phrygians, was amongst the Romans the emblem of liberty, and was assumed by slaves when manumitted. The English bonnet of former times was made of cloth, silk, or velvet, more or less ornamented. It was generally superseded by the hat in the early part of the 16th century; but in Scotland, bonnets were commonly worn for two centuries later. The genuine old bonnet of the Lowland Scottish peasantry was of a broad, round, flat shape, overshadowing the face and neck, and of a dark-blue colour, excepting a red tuft on the top. The fabric was thick milled woollen, without seam or lining, and exceedingly durable. No head-dress ever invented could stand so much rough usage. This 'braid bonnet' very closely resembles the *bonnet Béarnais*, or *béret Basque*, of the south of France. From its having been worn, till comparatively late times, by small rural proprietors, these came to be called *Bonnet Lawds*. The Highlanders have long worn bonnets of the same fabric, but these generally rise to a point in front, with ribbons hanging down behind. Such is the cap known as the *Glengarry Bonnet*. The *Balmoral* is flat, and is liker the Lowland bonnet. From time immemorial these various kinds of Scots bonnets have been manufactured at Stewarton and Kilmarnock, in Ayrshire. The Glengarry bonnet was formerly used as an undress cap by the infantry of the British army, and is still used by the Highland and other Scottish regiments.

Ladies' Bonnets are a brimless head-gear tied under the chin, now almost confined to old women and nurses. Those made of the fine stunted wheat straw, grown for the purpose in Tuscany, and called *Leghorn* and *Tuscan* bonnets, are well known. These have formed an important trade in that province for two centuries. Split-straw plait and bonnets formed of it are made at Luton and Dunstable (see *STRAW MANUFACTURES*). Willow-chip bonnets are made in the neighbourhood of Modena. Bonnets, partly or entirely of richer materials, such as horsehair, crape, velvet, and satin, with trimmings of feathers, lace, and artificial flowers, are made in Paris.

The word bonnet is also applied to the cover of a motor-car engine.

Bonnet, CHARLES DE, an eminent naturalist and philosopher, born at Geneva, 13th March 1720, was educated for the law, but devoted himself at a very early age to the study of natural history. A dissertation on aphides procured his election, in 1740, as a corresponding member of the French Academy of Sciences; and in 1743 he was admitted a Fellow of the Royal Society. At this time he was engaged in researches concerning polypi, the structure of the tapeworm, the respiration of insects, &c.; and in 1745 appeared his *Traité d'Insectologie*. His *Recherches sur l'Usage des Feuilles des Plantes* (1754) contained the result of much observation on important points of vegetable physiology. A severe inflammation of the eyes, putting a stop for two years to his researches in natural history, gave another direction to his studies, and he published several works on psychology, in which materialistic views decidedly prevail: the body is represented as the original source of all the inclinations of the soul, and all ideas are referred to movements of the nervous fibres; but his religious convictions remained always strong and unshaken, and in his *Idées sur l'État Futur des Êtres Vivants, ou Palmingénésie Philosophique* (2 vols. 1769), he endeavoured to demonstrate the reasonableness of the Christian revelation. In this work he also maintained the future life of all living creatures,

and the perfection of their faculties in a future state. His *Considérations sur les Corps Organisés* (2 vols. 1762) is largely devoted to an examination of the theories of generation. He died on 20th May 1793. Collective editions of his works (8 vols. and 18 vols.) appeared in 1779 and 1788. See the monographs on him by Lemoine (1850) and the Duc de Caraman (1859).

Bonnet-piece, a gold coin of James V. of Scotland, so called on account of the king's head being decorated with a bonnet instead of a crown, as was usual. James V. was the first Scottish sovereign to place dates on his money, and to diminish the size of the gold coins by increasing their thickness. His bonnet-pieces were struck of native gold, and are now much prized by collectors. See Edward Burns' *Coinage of Scotland* (1888).

Bonnet-piece.

Bonneval, CLAUDE ALEXANDRE, COUNT DE, also called Achmed Pasha, a French adventurer, was born of a noble family at Coussac, in Limousin, on 14th July 1675; and entered the army in his thirteenth year. He served with distinction in Italy and the Netherlands, but for extortion and insolence was condemned to death by a court-martial. He fled to Germany, where he obtained employment in the Austrian service; fought against his native country, distinguished himself by many daring exploits, and bore a principal part under Prince Eugene in the war against Turkey. But during a residence at Vienna he made himself disagreeable to the prince, and was sent, in 1723, as master-general of ordnance to the Netherlands, where he quarrelled with the governor, was brought to trial, and condemned to death by a court-martial. The emperor commuted the sentence to one year's imprisonment, upon condition of his never afterwards setting foot on German soil. He went to Constantinople, became a Mohammedan, was made a pasha of three tails, and achieved success as general in the war of the Porte with Russia, and in Persia. The sultan appointed him governor of Chios; but his own imprudence, and the envy of others, caused his banishment to the shores of the Black Sea. He died at Constantinople on 27th March 1747. The memoirs published as his are spurious. See Prince de Ligny, *Mémoire sur le Comte de Bonneval* (1817), and Vandal, *Le Pacha Bonneval* (1885).

Bonneville, NICHOLAS DE, one of the earliest French students of German literature, was born at Evreux, March 13, 1760. Early works are his *Nouveau Théâtre Allemand* (12 vols. 1782-85), a collection of German tales, and a translation of Shakespeare. After the revolution, he founded and edited several newspapers; but his moderation in tone and his liberality rendered him obnoxious to the ruling party, and on the fall of the Girondists he was thrown into prison. He also got into difficulties with Napoleon, and died November 9, 1828. His *Histoire de l'Europe moderne* (3 vols. 1789-92) and his *De l'Esprit des Religions* (1791) are still read.

Bonny, or BONI, a town and a river of Guinea, now in the British Nigeria protectorate. The river forms an eastern debouchure of the Niger, and falls into the Bight of Biafra, in about 4° 30' N. lat., and 7° 10' E. long. It is accessible at all times of the tide to vessels drawing as much as 18 feet of water, and safe anchorage at all seasons of the year is found within its bar. Its banks are low,

swampy, and uncultivated. On the east side, near its mouth, is the town of Bonny, notorious from the 16th to the 19th century as the rendezvous of slave-trading ships. The houses forming the town stand in a swamp where fever prevails; European traders generally take up their quarters on liverboats moored in the current of the Bonny. It exports considerable quantities of palm-oil.

Bonomi, JOSEPH, architect, was born at Rome in 1739, settled in England in 1767, became an associate of the Royal Academy, and died on 9th March 1806.—His son, JOSEPH BONOMI, the younger, born in Rome 9th October 1796, studied art in London, and became famous as a draughtsman, especially of Egyptian remains. He repeatedly visited Egypt and the Holy Land, and illustrated important works by Wilkinson, Birch, Sharpe, Lepsius, and other Egyptologists. He also published a book on Nineveh, and at his death, 3d March 1878, he was curator of Soane's Museum.

Bononcini. See BUONONCINI, HANDEL.

Bonpland, AIMÉ, an eminent traveller and botanist, was born at Rochelle, France, August 22, 1773. Having studied medicine and botany at Paris, he accompanied Humboldt in 1799 to South America, where they travelled nearly five years, during which time Bonpland collected 6000 new species of plants. After his return, he published several splendid and valuable botanical works. He went to Buenos Ayres in 1816, and was named professor of Natural History. Bonpland undertook an expedition of scientific discovery up the Paraná; but Dr Francia, then dictator of Paraguay, arrested him, and kept him prisoner for about nine years. He subsequently settled near San Borje, in the province of Corrientes, and died at Santa Anna in 1858. Among his works are: *Plantes Equinoxiales* (2 vols. 1808-16); *Monographie des Melastomées*, &c. (2 vols. 1809-16); and *Description des Plantes rares de Navarre* (1813-17). See his Life by Brunel (3d ed. Paris, 1872).

Bonspiel. See CURLING.

Bonstetten, KARL VICTOR VON, publicist, born at Bern, 3d September 1745, studied at Leyden, Cambridge, and Paris, entered the council of Bern, and became district governor, and in 1795 a judge in Lugano. He lived in Italy and at Copenhagen from 1796 to 1801, and after his return settled at Geneva, where he died 3d February 1832. Among his larger works are *Recherches sur la Nature et les Lois de l'Imagination* (Geneva, 1807), *Pensées Diverses* (1815), *Études de L'Homme* (1821), and *L'Homme du Midi et L'Homme du Nord* (1824), an examination of the influence of climate. Three volumes of his correspondence were published. See Life by Büchi (1889).

Bonus, an originally jocular use of the Latin word for 'good,' 'a good man,' to mean 'a good thing,' especially an extra dividend given to shareholders of a company from surplus profits, a portion of the profits of an insurance company distributed amongst policy-holders, or an additional sum paid to employees in view of special conditions, as during and after the Great War.

Bonvalot, PIERRE GABRIEL, French explorer, was born in 1853 at Épagne, in the department of Aube. He was educated at the lycée of Troyes. He travelled in Central Asia in 1880-82 and in 1885-87. In 1889-90 he accompanied Prince Henri d'Orléans in his journey from Siberia to Tonkin. In 1897 he undertook a political mission to Abyssinia. He became a deputy for Paris in 1902.

Bony Fishes (*Teleostei*), an order of fishes, including the vast majority of living forms. They make their appearance in Jurassic strata, but it

was not until the Upper Cretaceous and Tertiary periods that they became predominant over their forerunners, such as Elasmobranchs and Ganoids.

In the bony fishes (*Teleostei*) the skeleton is bony, with completely formed vertebrae; the skin is usually clad in the characteristic light scales; the heart has a non-contractile swelling of the artery in front of the heart (the *bulbus arteriosus*); the gills are free and protected by a bony cover (*operculum*); the intestine has no spiral fold running down it; the nerves to the eyes simply cross one another, and do not fuse as they cross. Generally speaking, they are more active than their forerunners.

Gunther divides the bony fishes into six orders, and since these must be repeatedly mentioned, the following key, based on the same authority, and copied from Leunis' *Synopsis des Thierreichs*, is essential:

I. *Acanthopterygii*—e.g. perch, mullet, beryx, mackerel, bull-head, lump-sucker, goby, blenny, gray-mullet, stickleback.

II. *Acanthopterygii Pharyngognathi*—e.g. wrass.

III. *Anacanthini*—e.g. cod, ling, sand-eel, turbot, flounder.

IV. *Physostomi*—e.g. carp, minnow, flying-fish, pike, salmon, trout, herring, eel.

V. *Lophobranchii*—e.g. pipe-fishes and sea-horses.

VI. *Plectognathi*—e.g. file-fish, coffer-fish, globe-fish, sun-fish.

Gills comb-like.	Pre-maxilla and upper jaw movable.....	Without spinous rays	Spinous rays on dorsal, anal, and ventral fins. { Lower pharynx bones separate . } I.
			United.....II.
	Pre-maxilla and upper jaw rigidly fixed to one another and to skull.....		Ventral fin (if present) on throat or breast; air-bladder without duct. } III.
			Ventral fins posterior; air-bladder with duct.....IV.

Gills composed of small rounded lobes.....VI.

For further information, see the article on Fishes, and separate articles; consult Gunther's *Introduction to the Study of Fishes*, Huxley's *Anatomy of Vertebrates*, and the *Cambridge Natural History* (vol. vii. 1901).

Bonyhád, a market-town of Hungary, in the county of Tolna, about 90 miles S. of Budapest. It has some trade in corn, wine, and tobacco. Pop. 10,000.

Bony Pike (*Lepidosteus*), also called GAR-PIKE and GAR-FISH (distinct from the other Gar-pike, q.v.), a genus of Ganoid fishes found in widely distributed fossil form as early as Tertiary times, and still surviving in temperate America and Cuba. The fish measures at full size towards 5 feet in length, and is covered with a complete mail of lozenge-shaped enamelled and bony scales. The outer enamel layer is bright and glistening. The general colour is brownish-yellow or greenish with darker markings. The skeleton is completely bony, the vertebrae (like those of salamanders) convex in front and concave behind, the fins with accessory pieces known as 'fulcra,' the dorsal and anal composed wholly of jointed rays, and situated far back. The snout is long and narrow, the mouth opening wide, the upper lip protruding beyond the lower, the dentition very well developed, with large catching and numerous small conical teeth arranged in rows. The paired fins are unlobed; the tail is markedly unsymmetrical (heterocercal). There are no spiracles, but accessory gills on the hyoid bones. The undivided

air-bladder is lung-like, opens into the gullet, and receives blood-vessels from the aorta. The dilated muscular chamber in front of the heart has eight transverse rows of valves. The bony pike or gar-fish lives in rapid rivers, swims with great force, has great flexibility in the neck region, and preys voraciously on other fishes. Formerly more widely distributed, it is now found in the fresh waters of North Central America and Cuba. Many species have been distinguished, but Gunther only recognises three—*L. viridis*, *L. platystomus*, and the commonest *L. osseus*. The genus occurs as such in Tertiary strata, and is represented in earlier times by many forms (Lepidotidae, &c.). The flesh of the bony pike is esteemed for food. See GANOIDS.

Bonze, a modified Japanese word applied by Europeans to the Buddhist priests of Japan and of China.

Booby (*Sula piscator*), a species of Gannet (q.v.), which has received this name from its apparent stupidity in allowing itself to be knocked down with a stick or taken by the hand. Accounts differ very much, however, as to this character of the booby, some representing it as singular in not taking alarm nor becoming more wary even when it has had reason to apprehend danger from man; others, as Audubon, asserting in such a manner as apparently to place it beyond dispute, that it does learn to be upon its guard, and even becomes difficult to approach within reach of shot. The booby is not quite so large as its congener, the common gannet or solan-goose, but, like it, is a bird of powerful wing. It feeds on fish, which it takes by diving in the sea, observing its prey as it sweeps along in graceful and varying flight, sometimes

Booby.

at a height of only a foot or two from the surface of the water, sometimes twenty yards above it. The bird is sometimes taken, like the gannet, by means of a fish fastened to a board, through which it drives its bill, as it dashes at the bait. The booby is of a blackish-brown colour, whitish beneath; its colours are subject to some variation, and in young birds a general brown colour prevails; the sexes differ very little, except that the female is not quite so large as the male. The expansibility of the gullet enables the booby to swallow fishes of considerable size. The bill, which is straight, conical, and longer than the head, opens beyond the eyes, as in the rest of this genus. It is found on almost all tropical and sub-tropical shores, and sometimes even 200 miles from land. On the east coast of North America, it reaches about as far north as Cape Hatteras, but is much more abundant farther south, great numbers breeding on the low islands off the coast of Florida. The nest is often placed upon a low bush,

and 'is large and flat, formed of a few dry sticks, covered and matted with seaweeds in great quantity.' It contains only one egg or young one at a time. The booby is much persecuted by the Frigate Bird (q.v.) and man-of-war bird, which are more powerful and of swifter flight, and often compel it to disgorge for their use the prey which has just been swallowed. The flesh of the booby, although sometimes eaten by sailors, is dark coloured, and not very agreeable.

Booby Island, a level rock in Torres Strait, in 10° 36' S. lat., and 141° 53' E. long., $\frac{1}{4}$ mile in diameter. Being dangerous to navigators, and destitute of resources of its own, it used to be pretty regularly supplied with provisions and water by passing vessels, for the benefit of shipwrecked sailors. It has had a lighthouse since 1886.

Boodroom. See BUDRUM.

Book. The volume which the reader has at present in his hands is a normal specimen of what is now understood by a printed book. Printed matter occupies both sides of a certain number of leaves of paper, which are so arranged that, beginning at the upper end of the left side of the first page, he may proceed without dislocation of thought always from left to right till he reach the lower end of the last page. The first page or *recto* of the first leaf or *folio* (often omitted, as in the present work), containing usually an abbreviated form of the title, is technically known as a *bastard* or *half title-page*; the next page or *verso* of the first folio is left blank. Then follows the *title-page* proper, usually with a blank page at the back. In many books there intervene a preface or introduction, a dedication, and a table of contents before the main body of the book begins. If any portion of the book has got out of its place, there are two ways by which the true order can be discovered. At the outer corner of each page is a number—1, 2, 3, &c.; this is the pagination or numerical order of pages. At the left-hand foot corner of page 1 is the number 53; and 54 will be found similarly on page 17. The sixteen pages thus indicated have been produced by the folding of a single sheet of paper. Fifty-three is the signature (as it is called) on the first page, because 52 sheets have been used in the previous volume. A, B, &c. are often used for numerals; and if the book goes beyond the number of letters in the alphabet, the series is continued—A A, B B, &c., or 2 A, 2 B, &c.

To understand the historic origin of this normal modern book, we must go back to a remote antiquity. The word 'book' itself (Old English *bōc*, Ger. *buch*, Dutch *boek*) appears in Gothic as a plural noun meaning 'letters of the alphabet.' There is difficulty in connecting it with the 'beech' tree (Old English *bōc*, *bēce*, Ger. *buche*, Dutch *beuke*). *Liber*, the Latin equivalent (which has been adopted by all the Romance and Celtic tongues—Fr. *livre*, Ital. *libro*, Gaelic *leabhar*, Welsh *leor*—and is the source of our English word *library*), properly meant bark, and was applied to prepared papyrus tissue from its bark-like appearance. The Greek *biblia*, in like manner, is associated with *byblos*—i.e. papyrus.

As it is now well known, the ancient Babylonians and Assyrians had a wide and varied literature. This was preserved in two ways: either painted on the leaves of the papyrus which grew in abundance on the banks of the Euphrates, or impressed on clay shaped into tablets or cylinders. Such skill was displayed in the treatment of this latter material that the inscribed characters by their minuteness 'suggest that they must have been written with the help of a magnifying glass.' A representation of a typical polygonal Assyrian clay-tablet will be found at WRITING. The Hittites

also used clay tablets. The defects, as well as certain advantages, of this form of 'book' are obvious. It has no direct connection with the modern European book. The case is different, however, with the ancient Egyptian book. The sequence may be maintained from the volume at present in the reader's hands back for thousands of years to the oldest Egyptian 'volume' still extant (in a sense the oldest book in the world)—the *Papyrus Prisse* (see ALPHABET, WRITING), which must be assigned to a very early period of Egyptian history, probably to 2500 or 3000 B.C. In the article WRITING there is further information about the earliest written books—Egyptian, Greek, Latin, and Indian, with illustrations of the characters employed. Owing to its wonderful adaptability to literary purposes, the prepared papyrus tissue (see PYPYRUS) spread to Greece (at least before the time of Herodotus) and to Rome; and though it was partly supplanted, especially in certain regions, by the finer kinds of prepared skins—the material used by the Jews, Persians, and other oriental nations—it maintained its position as a book-material down to the 10th century A.D. Ali Ibn el Azhad in 920 describes the different kinds of pen required for writing on paper, parchment, and papyrus. Papyrus could not well have been utilised in any such form as the modern bound book. The ancient papyrus-book, whether Egyptian, Greek, or Roman, was got up very much like a modern mounted map. A length of the material, written on one side only, was fastened to a wooden roller, round which it was wound; this formed a *tama* (Egyptian), *kulindros* (Gr.), or *volumen* (Latin), hence our 'volume.' Specimens of Egyptian rolls still exist, extending to upwards of 20 and even 40 yards; but the great inconvenience attaching to the consulting of such enormous scrolls (though we still find similar pedigree rolls in England—e.g. at Helmingham, Suffolk) made it much more usual to break up any lengthy literary production into sections, each on a separate roll. Certain suitable sizes became normal, and this conventional length of the roll exercised a considerable influence on the length of what are still called the 'books'—i.e. divisions of the classical authors. In Egypt the rolls were kept in jars (holding say nine or ten each); in Rome in wooden boxes or canisters (often of costly workmanship), or in parchment cases. The change from the rolled to the folded form of book appears to have taken place in the ancient world after the adoption of parchment or vellum, though practically the same arrangement of successive surfaces had been in vogue in the books or tablets of waxed wood used for notes and letters. *Codex*, the Latin name for such a parchment volume, is still retained as the designation of the more important ancient MSS., as *Codex Alexandrinus*. The form remained practically unaltered throughout the middle ages, and being even more suitable for paper than for vellum, was ready on the invention of printing to facilitate its full development. For details in regard to the ancient MS., see PALÆOGRAPHY. For Block-books, see WOOD ENGRAVING.

Sizes of Books.—The vellum, and afterwards the paper book of medieval times, was made up in the following way. 'Quires' or 'gatherings' were formed sometimes of four sheets folded in the middle and placed one within the other, so as to furnish eight leaves, sometimes of five sheets yielding ten leaves, sometimes of six yielding twelve. These groupings were known as quaternions (*tetradia*), quinterns or quinternions (*pentadia*), and sexterns (*hexadia*). This same method was adopted by the early printers, who at first indeed only printed as the copyists had written, one page at a time. In the colophons (see below) of many of the older books, a register or collation, as it is called, of all the quires—whether

ternions, quaternions, or so on—is supplied for the guidance of the bookbinder. The signatures on the several quires were at first inserted by hand, and were first printed at Cologne in 1472. When it became usual to print a certain number of pages at once, the paper was not folded and cut up till it had passed through the press. The number of times it required to be folded afforded a ready means of distinguishing in a general way the different sizes of books as long as the paper continued to be made by hand, in frames the size of which did not greatly vary. The nomenclature is still in vogue, though it has ceased in these days of machine-made paper to be a correct guide to the real sizes of books. In America, the proposal to distinguish sizes by an actual measurement of height and breadth of paper has met with some acceptance; but the old fashion still prevails in Europe. A sheet being folded in the middle forms two leaves or four pages; and a book composed of such sheets is styled a folio whether it measure 1½ feet or 4 feet in height. When the sheet is again folded it makes a quarto. In hand-made paper (i.e. the paper used in nearly all books of purely bibliographical interest) the water-line runs either across or down the page according to the number of foldings. The following scheme is serviceable:

Folio, folded....	1 time = 2 leaves, water-line perpendicular.
Quarto... (4to)	2 times 4 " " horizontal
Octavo... (8vo)	3 " 8 " " perpendicular
Duodecimo (12mo)	4 " 12 " " horizontal
Sextodecimo (16mo)	4 " 16 " " horizontal

Less ordinary, and diminutive, sizes are 18mo (water-line perpendicular), 24mo (perpendicular), 32mo (perpendicular), 36mo (horizontal), 48mo horizontal, 64mo (horizontal), 72mo (perpendicular), 96mo (perpendicular), 128mo (perpendicular). In this country for a long period printing-paper was chiefly of three sizes—royal, demy, and crown; and according as any one of these was employed, the size of the book was large or small. Demy, however, was the most commonly used; and the demy 8vo may be said to have become the established form of standard editions. The size of the present work is imperial 8vo. Among books, as among men, there are giants and dwarfs. Certain church-books in the Escorial are described as 6 feet in height by 4 in breadth; and the 'Antiquity' volumes, for example, of the Napoleonic *Description de l'Égypte* measure 37½ inches in height. The 'Thumb Bible' is, on the other hand, not much bigger than a postage-stamp; Pickering's Diamond edition of *Tasso* measures 3½ inches high by 1½ wide; and Hoepli's 1878 *Divina Commedia* is less than 2½ inches by 1½.

Colophons.—The scribes employed by Assur-banipal (680 B.C.) used to place the account of their documents at the close of the last column on their cylinders. In like manner, the early European printers often gave details about their books in the closing paragraph, now technically known in English as the *colophon* (from a Greek word for apex or terminus), in French as *souscription*, in German as *Schluss-schrift*. Caxton varies his colophon from the simplest *Explicit, Hic finis*, or 'Here endeth,' to elaborate epilogues or post-faces. Quaintest of all, perhaps, is his rhyming conclusion to the *Moral Proverbs*:

Go thou littil quayer | and recoṃmaund me
Unto the good grace of my special lorde
Therle Ryueris, for I have emprinted the
At his comāndement, folowynge eury worde
His cōpye as his secretaire can recorde.
At Westmestre of feuerer (February) the xx daye
And of Kyng Edward the xvij yere vraye (truly).

See Blades's *Caxton*, Legrand's *Bibliographie Hellénique* (1885), Kennard's *Some Early Printers and their Colophons* (1902).

Title-pages.—Though Caxton's work affords no

instance of a title-page—unless *The Chastising of God's Children* (1491?) be his, and it contains simply three lines of ordinary print—this does not represent the general stage of typographic development. The first printer lavish enough to devote a whole page to the title of a book was Arnold ther Hoernen of Cologne, who printed the *Sermo ad Populum* in 1470. Conrad Fyner of Esslingen followed in 1473. With the adoption of the title-page, the colophon naturally disappeared, though instances are found well into the 16th century. The treatment of the title-page has varied enormously at different periods: in the 16th and 17th centuries becoming at times so crowded with details as to lose half its value as a ready means of determining the purport of the book. Laudatory descriptions of the author and his work were freely introduced: 'Very necessary to be known'; 'Very pleasant and beneficial'; 'A book right rare and strange,' are among the phrases familiar to all book-lovers. Except in the case of works of fiction and popular theology, the tendency of the present time is to make the title brief and business-like. Dickens's *Adventures of Oliver Twist* even contrasts curiously with the title-page of the first edition of, say, *Robinson Crusoe*. Metaphorical titles (so abundant in the Elizabethan and Jacobian periods) are serviceable as distinctly individualising a book, but are very apt (as in Ruskin's *Notes on the Construction of Sheepfolds*) to mislead the unwary. Double titles (as in Ruskin's *Proserpina: Studies of Wayside Flowers*) are equally dangerous; and open to strong objection is the habit of re-issuing an old work with a new title. The title of a book is by English law as much the property of an author as any other part of his book. Consequently, a lawsuit may be the result of even unsuspectingly using a title already appropriated (see COPYRIGHT). Compare the fac-simile title-pages in Könecke, *Bilderatlas* (1887); Le Petit, *Principales Éditions originales d'Écrivains Français* (1888). See Lang, *Books and Bookmen*; Pollard, *Last Words on the History of Title-pages* (1891).

Dates.—In the dating of their books the early printers, like the scribes, were extremely negligent. 'Of twenty-one works,' says Mr Blades (*Caxton*, i. p. 31), 'known to have issued from the press of Colard Mansion, not more than five have any date to them; and of nearly one hundred publications attributed to Caxton's press, considerably more than two-thirds appear without any year of imprint.' At other times we find the date given with great precision: thus, *The Book of the Knight of the Tower* has 'and enprynted at Westminster the last day of Janyuer, the fyrst year of the regne of Kyng Richard the thryd.' In the present day nearly all respectable publishers put the correct year in which their books are issued at the foot of the title-page, either in ordinary figures or in the Roman notation. When a book is not dated, one suspects a desire on the part of the publisher to sell his old stock as if it had newly seen the light. Unfortunately, the device of attaching a new title-page with a fresh date to matter that has lain in the warehouse for many years is adopted by firms whose reputation ought to be above reproach. The following are among the more important deviations from the normal methods of Roman notation to be found in the colophons or title-pages of early printed books (see Brunet, *Connaissances nécessaires à un Bibliophile*):

M CCCCiii XX VIII = 1488 (i.e. 1000 + 400 + 4 × 20 + 8).
 M iii Ciii XX viij = 1438 (i.e. 1000 + (4 × 100) + (4 × 20) + 8).
 M CD XCV = 1495 (i.e. 1000 + (500 - 100) + 95).
 M iij D = 1496 (i.e. 1000 + 500 - 4).
 M IIID = 1497 (i.e. 1000 + 500 - 3).

CIO IO CXX VI = 1626 (i.e. 1000 + $\frac{1000}{2}$ + 100 + 26).

In many cases the older printers indulged in
 72

curious chronograms; sometimes using them to repeat in the preface a date already distinctly stated on the title-page. An extreme instance is the *De spiritali IMitacione Christi saCræ et Vitæ pili In LVCEM Data*, a R. P. Antonio Vanden Stock Societatis Jesu, Ruramundæ, Apud Gasparem du Pres—a book which contains upwards of 1500 chronograms on the date 1658 (see CHRONOGRAM); and James Hilton, *Chronograms* (1882), *Chronograms Continued* (1885), and *Chronograms Collected* (4000 additional, 1896).

When dates are wanting, the age of a book may often be approximately determined by certain external characteristics, which must, however, be used with caution. Watermarks (Ger. *wasserzeichen*; Fr. *filigranes*), for example, are of importance, but their evidence has been frequently strained. Compare article PAPER; and see the works of Fischer (1804), Boyer (1860), Midoux and Matton (1868), and Sotheby's *Principia Typographica*.

Place of Publication.—Even when the name of the place of publication is given in full, it may require some knowledge to recognise it under the several forms current in different languages and at different periods. Thus Cologne may appear as Colonia, Colonia Agrippina, Cueln, Ceulen, Keulen, Köln, &c.; or the periphrasis *in civitate Coloniensi* may be employed, the *n*'s being represented by strokes above the vowels (see PALEOGRAPHY); Venice may be more or less disguised as Venetia, Venetia, Venezia, Venedig (German), Wenez (in the local dialect), Enetia (in Greek), and Mleczi, Bnezieh, Mnezik, and Mljetka (in Slavonic). Well-known places may be concealed under some pseudo-classical translation of, or pun upon, the true name; thus, Herbiopolis stands for Würzburg; Leucopetra for Weissenfels; Probatopolis for Schaffhausen; Eleutheropolis for Freystadt, Francheville, Francavilla, &c. This latter is a good instance of a difficulty that may arise. Not only may Eleutheropolis represent one of many towns, but from the meaning of the word it has frequently been employed by printers who did not wish to declare the true place of publication. Another instance is Irenopolis ('City of Peace'), which is historically an equivalent of Berœa. The following list will be convenient: Argentoratum, Strasburg; Augusta Vindelicorum (often only Augusta), Augsburg; Basilea, Basel; Bipontum, Deux-Ponts; Bononia, Bologna, or Boulogne; Cadomum, Caen; Cæsaraugusta, Saragossa; Cantabriga, Cambridge; Corona, Cronstadt; Dortacum or Dordrechum, Dort; Eboracum, York; Gippesvicum, Ipswich; Gratiopolis, Grenoble; Hafnia, Copenhagen; Hala, Halle; Holmia, Stockholm; Insula or Insulæ, Lille; Ispalis, Seville; Leodicum, Liège; Lipsia, Leipzig; Lugdunum, Lyons; Lugdunum Batavorum, Leyden; Lutetia, Paris; Massilia, Marseilles; Matisco, Macon; Mediolanum, Milan; Moguntiacum, Mainz; Mons Regalis, Mondovi; Mussipons or Pontimussum, Pont-à-Mousson; Neapolis, Naples; Neapolis Casimiri, &c., Neustadt an der Hardt; Enipons, Innsbruck; Olisipo, Ulyssipo, Ulyssipolis, Lisbon; Oxonia, Oxford; Petropolis, St Petersburg; Regiomontium, Königsberg; Rotomagus, Rouen; Sarum, Salisbury; Tarvisium, Treviso; Tornacum, Tournai; Trajectum, Utrecht; Treceh or Civitas Tricassina, Troyes; Tridentum, Trent; Turoni, Tours. See *Dictionnaire de Géographie Ancienne et Moderne à l'usage du Libraire* (Paris, 1870).

To divert suspicion, printers have often put totally erroneous names on their title-pages: hundreds of European books bear to have been issued at Pekin; thousands of the products of the Parisian presses claim The Hague (La Haye) or some other

Dutch town as their birthplace. Quite recently Burton's literal translation of the *Arabian Nights* bears to have been printed at Benares. In the earlier centuries printing and publication were so much the same thing that to know the place where a book was printed was practically to know where it was published, and *vice versa*. At present it is not uncommon for a work to be printed in one country and published in another. When publishing firms have houses or agencies in different cities, all may be mentioned on the title-page, and precedence accorded rather in keeping with the importance of the cities. Thus, 'London and Edinburgh' frequently appears in books which were entirely produced in the lesser city. With the introduction of stereotype or electrotype plates it has become possible for a book to be printed in more places than one with only one setting-up of type. See Weller, *Die Falschen und Fingerliten Druckorte* (1864).

Pagination.—At first the printed book was issued like the manuscript without any numbering of the pages. In the *Sermo ad Populum* (1470) the leaves were numbered; the numbering of the pages followed. In many modern books, when the page contains two or more columns, each column is numbered consecutively. When a book consists of several volumes, each has usually its own pagination; but in some great treatises running through several volumes, it expedites reference from the index to number right through from the beginning to the end of the whole series. In the old folios and quartos letters were not infrequently inserted on the margin, so as to break each page into distinct portions without interfering with the continuity of the text. The marginal letters from the first editions of the classics are often reproduced in modern editions just as they originally stood, and form a convenient method of reference.

Preface, &c.—The *Preface* is the introductory address of the author, in which he explains the purpose and scope of his book, and, as it were, introduces himself to his readers. Our ultra-Saxonists prefer to call it a 'foreword,' in keeping with the German *Vorwort*. Formerly it was usually headed *To the Reader, To the Gentle Reader, To the Courteous Reader, &c.*

In the times when the professional author depended largely on the patronage of some person of rank, the *Dedication* was an integral and indispensable part of a book. If he made sure of his *Mæcenas* he could let the many go. At present being for the most part a mere expression of personal esteem or affection, the 'I dedicate' has become as simple in form as in the 17th and 18th centuries it was elaborate with all the rhetorical artifice to which flattery could attain.

Pictorial Imprints or Printers' Devices.—One of the happiest passages in the *Book Hunter* deals with the trade emblems of the old printers. The subject on which it merely touches has been treated at length in such works as Silvestre's *Marques Typographiques* (2 vols. Paris, 1867); Roth-Scholtz's *Thesaurus Symbolorum ac Emblematum, id est, Insignia Bibliopolorum et Typographorum* (Norimbergæ, 1730); Berjeau's *Early Printers' Marks* (Lond. 1866). It is enough here to mention the boldly drawn three-mast ship of Mathis van der Goes, Antwerp (1472-94); the windmill of Andrew Myller, Edinburgh (1508, &c.); the curious wild men and fruit-laden tree of Thomas Davidson, Edinburgh (1541); the olive-tree of the Stephenses; and the sphere of the Elzevirs. In many instances there is a punning allusion to the printer's name: Froschover has his frogs (Frosch in German), and Le Chandelier his seven-branched candlestick; Nicholas Eve gives us a picture of the presentation of the forbidden fruit. Others

make use of the arms of the cities in which they worked. Leeu shows the castle of Antwerp, R. Hall the half-eagle and key on a shield of Geneva, Stadelberger the lion rampant of Heidelberg and the shield diapered of Zurich, &c. Ascensius (1462-1532) has 'bequeathed to posterity the lively and accurate representation, down to every nail and screw, of the press in which the great works of the 16th century were printed, with the brawny pressman pulling his proof.' His device with the inscription *Prelū Ascēnsianū* was adopted by Josse Bade, Paris (1501-35), who added his initials at the foot; by De Gourmont (1507-15); Le Preux (1561-87); and in a modified form by De Marnef (1567) and De Roigny (1565). The anchor and dolphin of the Aldi was employed by Turrisan, De Chenney, Brillard, Tardif, Coulombel, sometimes, as in the last instance, with the divided Aldus.

Imprint of Caxton.

Decoration of the Book.—Leaving out of view the pictorial illustration devoted to the elucidation of the subject treated of in a book (see ILLUSTRATION), there are certain forms of illustration which are merely decorative appendages to the book itself. Besides the ornamental treatment of the title-page with peculiar letters, the use of red or blue ink, and the insertion of a printer's emblem or some appropriate vignette, we must mention the engraved title-page (in the 16th and 17th centuries often a most elaborate and costly piece of work), the frontispiece or engraving placed opposite the title-page; ornamental initial letters for chapters; headpieces or vignettes for the blank space generally left before the beginning of a new chapter; and tailpieces at the end of the chapters. By the earliest printers the insertion of decorative details was left to a special artist—the rubricker (so called from the red ink which he mainly employed). Space was often left for his initial letters, and at most only a small letter inserted to guide him.

Imprint of Gaspard Philippe, Paris (1500-10).

In describing second-hand books various technical expressions are employed. *Black Letter* is explained in a separate article. *Uncut* means that the

original size of the paper has not been reduced by cropping the edges, not, as is often supposed, that the paper is still in the sheet, a condition for which there is no generally accepted term. The French use *non coupé* in this latter sense, and for 'uncut' *non rogné*. *Forced* means that a book is damaged by brown or yellow spots. *Curious* is used euphemistically for 'improper.'

See, besides books already cited, Madan, *Books in Manuscript* (1893); Pollard, *Early Illustrated Books* (1893); Duff, *Early Printed Books* (1893); Putnam, *Books and their Authors* (N.Y. 1896); also the articles BIBLIOGRAPHY, BIBLIOMANIA, LIBRARY.

Bookbinding, before the invention of printing and in the days of manuscript Bibles, Psalters, and Books of Hours, was performed largely by monks, who prepared the books up to a certain point ready for ornamentation by the goldsmith and jeweller; and the earliest works from the press were at first printed and bound in direct imitation of these manuscript volumes. Fig. 1 is copied from the side

Fig. 1.

of a Book of Hours bound in the early monastic or Byzantine style, with a figure of Christ carved on an ivory plaque in the middle, surrounded by gold filigree work and sixteen jewels. Gold tooling came from the East, and was introduced into Europe (probably Italy) about the end of the 15th century. It was not till then, when the printing-press had become common in Italy, that binding took rank as an art by itself, and it was probably in the workshops of Aldo Manuzio (Aldus), the famous printer of Venice, that decorative art of the highest character was first applied to the ornamentation of book-covers. There are in the National Library at Paris books bound for an Italian connoisseur named Tommaso Maioli, and for another celebrated bibliophile, Jean Grolier of Lyons (1479-1565), which are unsurpassed in beauty of design and workmanship at the present day. This taste for artistic bookbinding soon spread to France, where the king and the richer among the nobility vied with each other in the possession of handsome bindings. Louis XII. and his queen, Anne of Brittany, both possessed fine examples, probably of Italian workmanship. Henri II. and Catharine de' Medici were perhaps the most enthusiastic royal patrons of the art, and the king's favourite, Diana of Poitiers, had probably the finest collection of splendidly bound books that was ever got together. Henri III., who was also a

great lover of books, was afflicted with a peculiar mania for all kinds of emblems of death, and carried it so far as to cause the well-known death's head and cross-bones to be introduced on his bindings; it thus became very easy to recognise volumes which had once formed part of his library. Jacques Auguste de Thou (Thuanus), president of the parliament, and a great friend of Grolier, was another celebrated collector of sumptuously bound books of this period.

Nicholas and Clovis Eve were celebrated royal binders of the latter part of the 16th century; to both of these have been attributed, but on insufficient data, the introduction of the style known as *fanfare*, with geometrical patterns filled in with sprays of leaves, palm branches, and other foliated forms.

In the early part of the 17th century we meet with the name of Le Gascon, probably the by-name of Florimond Badier, whose work merits great praise. The peculiarity of his ornament, known as *pointillé*, consists in filling in a geometrical outline with innumerable minute gold dots, often thus forming very pleasing patterns. During this century Macé Ruette and Luc Antoine Boyet were royal binders of note. In the early 18th century the most famous workmen of the craft were Duseuil, Padeloup, and Derôme, who faithfully carried on the tradition of their predecessors. A famous binding attributed to Nicolas Padeloup is that figured in our engraving (fig. 2), a *Daphne et*

Fig. 2.

Chloe of 1718, with the arms of the then regent of France, the Duke of Orleans.

During the 19th century bookbinding continued to preserve its rank as a fine art, especially in France, where the most elaborate work, executed with the greatest care and skill, is more sought for than in other countries.

Germany and the Netherlands are remarkable for their ornamental leather bindings, pigskin and calf being the favourite leathers. The earlier bindings were ornamented in 'blind' (i.e. without gold), either by cutting designs on the leather or stamping it with dies, rolls, or panel stamps, showing portraits of historical persons and allegorical figures. The art of gold tooling was introduced into Germany about 1530, but it never became as popular as it did in Italy, France, and England, and German gold-tooled bindings have never reached a high standard of excellence.

England, at the end of the 12th century, was

foremost as regards stamped leather bindings; these were ornamented in 'blind' by impressing on the leather small dies of various shapes and designs. Some important binders whose names have survived are: Julian Notary, in the reign of Henry VII.; Thomas Berthelet (who probably introduced gold tooling into England), John Keynes, and Nicolas Spierinck, in the time of Henry VIII.; John Gibson, of Edinburgh; Nicholas Ferrar and the 'Nuns' of Little Gidding, who produced the remarkable 'Harmonies' of the Scriptures; and Samuel Mearne, famous for his 'cottage' patterns, which resemble a cottage gable, in the 17th century; Eliot and Chapman, who bound the library of Robert Harley, Earl of Oxford, in the style now called the 'Harleian,' and Roger Payne (the most famous English binder), in the 18th century. Baumgarten, Benedict, Kalthoebler, Staggemeier, and Walther carried on the tradition of fine binding, and they were succeeded by other excellent binders, such as Heing, Lewis, Bedford, Riviere, and Zaehnsdorf. At the present day there are binders whose names will go down to posterity amongst those of the most celebrated craftsman.

Bookbinding may be divided into two main classes—viz. 'bound' work, which is effected by hand labour, and 'cased' work, which is produced almost entirely by machinery; the essential difference being that the boards of a 'bound' book are secured to the book before the covering material is attached, whereas the cover of a 'cased' book is made separately and then simply pasted to the sides.

In hand work, if the binder receives the books in sheets, the first operation is folding; usually sheets are folded three times, producing *sections* of sixteen pages. At the foot of the first page of each sheet (see PRINTING) is a letter or figure, called its *signature*; the first sheet of a book is A or 1, the second B or 2, and so on. After the sheets are folded, complete books are obtained by 'gathering' a section off each of the various piles, which are arranged in proper order. The separate books are collated or examined to see that the signatures are in their correct sequence. They are then pressed to give them solidity, the end-papers are attached to the first and last sections, and the books are ready for sewing. There are several methods of sewing: (1) 'flexible' sewing over raised bands, (2) sewing on cords which are sunk in saw cuts in the back of the sections, (3) sewing over tapes, (4) overcasting (or whipstitching), if they consist of single leaves. In hand-sewing cords or tapes are stretched on a sewing frame, and the sewer passes a threaded needle in and out of each section in such a manner that the thread goes round each cord or tape; when a book is sewn it is cut from the frame so as to leave about two inches of cord or tape on either side. It is then taken to the *forwarder*, who glues the back, and, when nearly dry, rounds it by the aid of a backing hammer; the book is then placed in a press between backing boards, and grooves (into which the boards are to fit) on either side are formed by striking the back dexterously with a hammer. If the book is sewn on cords they are laced to the boards, and the ends pasted and hammered down; if sewn on tapes, they are usually inserted between 'split' boards. The edges are then cut with a 'plough,' and ornamented by marbling (a separate industry), gilding, or sprinkling with colour. Headbands are afterwards affixed to the head and tail of the book; if these are worked on they strengthen the book. If the book has been sewn on the sawn-in method and is to have a 'hollow back,' the back is lined with strong paper, and the back is not attached to the covering material; but if the book is to have a 'tight back' the leather cover is glued directly to the back. In

covering the book the edges of the leather are pared thin, and the whole is covered with paste. The leather is drawn over the back and sides, and turned over the boards, and the end-papers are pasted down. The work is then handed over to the *finisher* for tooling. He prepares the leather by washing it with paste-water, and afterwards applying glaire, made of the white of egg, on which gold-leaf is laid. The lettering and ornamentation are effected by heating the hand tools over a gas stove, and impressing them on the work, whereby the gold is made to adhere; the superfluous gold is afterwards rubbed off with a piece of soft rubber, and the book is finished. Books covered entirely with leather are known as 'whole bound'; 'half-bound' is applied to a book having a leather back and corners, and the sides covered with cloth or paper; 'quarter-bound' books have leather backs only, and cloth or paper sides. 'Limp' books have thin, flexible covers. 'Roxburghe binding' is quarter-binding in straight grain roan or moiré, with coloured paper sides; generally the top edge is gilt.

In England cloth is generally used for edition binding, but on the Continent publishers usually issue their books with paper covers. Cloth for the covering of books was introduced in 1822 by Pickering the publisher, and Leighton the binder.

For folding sheets for edition binding there are ingenious machines for making various folds, some of which have automatic feeders. After the sheets are folded, the plates and maps are tipped (i.e. pasted) to their respective sections, and the end-papers attached by a machine to the first and last sections of the book. 'Gathering' is performed by piles of the sections of the book being placed in a series of boxes on a machine, and the sections for a complete book are delivered automatically on to an endless band. The books, after being collated, are sewn by one of the various book-sewing machines. Machine-sewing may be plain, through mull, through or over tapes, and over cords. After being sewn, the books are made compact by being pressed in a smashing or nipping machine, the backs are glued to hold the sections together, and then the edges are trimmed by a cutting machine, of which there is an almost endless variety, some having only one knife, others having two, and others having three. Glue is now applied to the back; and, when nearly dry, the books are rounded and backed by a machine, the operator simply feeding each book between a pair of rounding rollers. The back is again coated with glue, and a strip of mull and paper are attached. As soon as the books are dry, they are ready to have a complete cover or 'case' attached, which is generally made entirely by machinery. Case-making machines automatically glue the cloth, apply the boards and back lining, and turn in the edges of the cloth, thereby making a complete cover. Cloth book-covers may be decorated by blind stamping, embossing, stamping in gold or alloyed metals, or printing in colour, or by a combination of some of these processes. For blocking in blind or in gold, or for printing in colour, dies or blocks cut in relief are required; for stamping in relief, a die of hardened brass, cut in intaglio, and a counter die are necessary. Most of the blocking machines work in similar manner: the block is fixed to an upper plate, under a heating-box; the cover, after having had the gold-leaf laid on, is placed on the lower plate, and it is then brought into contact with the heated die, which gives the impression and fixes the gold-leaf. The superfluous gold-leaf is afterwards rubbed off, leaving only the ornamentation. Colour work is done without heat. Great attention is now paid to the designing of book-covers and end-papers, a separate school of book-cover designers having

ansen, and famous artists, such as Walter Crane and Sir Hubert von Herkomer, have devoted their talents to this work. The book and its cover are now combined—an operation termed ‘casing-in.’ The casing-in machine applies paste to either side of the book, and automatically places a cover over it, and the book is afterwards removed by the operator, to be consigned to the hydraulic press, in which books are stacked for a few hours, after which they are ready.

Magazines and similar books, consisting of several sections, are generally secured by clamping two or three wire staples through the side by means of a machine; but there is also a machine that binds them, by first cutting the sections into single leaves, then glueing them and applying a strip of mull, and finally attaching a paper cover. Pamphlets, forming a single section, are generally stitched by a wire-stitching or a thread-stitching machine; the latter makes the holes, draws the thread through them, ties a tight reef-knot, and cuts the thread.

There are several other branches of binding in which some binders specialise, such as ‘Bible work’ (including prayer-books), public library binding, and ‘stationery binding,’ the latter being concerned with the binding of account-books.

Book Cliffs, the brilliantly coloured escarpment of the Book or Roan Plateau in Colorado and Utah.

Book-club is either (1) an association for purchasing and reading new books as they issue from the press, or (2) an association for the printing of books relating to some special branch of inquiry. The importance of the former kind of book-club has greatly diminished in Britain since the general establishment of circulating libraries after the style of Mudie’s in London. The present article deals with the printing book-club only. The oldest is the Cymmrodorion or Metropolitan Cambrian Institution, founded in 1751, and reconstituted in 1820, and again in 1877. The still earlier Dilettanti Society (1734) is also a kind of book-club, its *magnum opus* the *Antiquities of Ionia* (4 parts, 1769-1832). But the practical prototype of the true book-club was the Roxburghe, instituted (17th June 1813) in commemoration of the sale of the Duke of Roxburghe’s library, and more especially in honour of the Valdarfer *Boccaccio*. At first the club was largely convivial, its dinners costing sometimes £5 or £6 a head; though it was understood that each member was to be at the cost of reprinting as many copies of some scarce work as there were members in the association—the chairman’s copy to be on vellum. The first issues were quite trivial; and the solid work of the club began only with Sir Frederick Madden’s *Romance of Havelok the Dane* in 1828. It was the Bannatyne Club (q.v.), founded by Sir Walter Scott in 1823, which began the regular issue of really substantial productions. The Camden Society introduced the method, now universal, of taking an annual sub-

scription from each member, instead of leaving the whole expense of a book to be defrayed by one individual; and thus, among other advantages, secured a more equal standard of excellence. Omitting learned societies which publish only Proceedings and Transactions, the following is a brief list of the more important book-clubs and book-printing societies of Great Britain: Maitland Club (Glasgow, 1828-59), after Sir Richard Maitland of Lethington, works illustrative of Scottish history, antiquities, and literature; Oriental Translation Fund (1828-58); Iona Club (Edinburgh, 1833-38), history, antiquities, and early literature of Scottish Highlands and Islands; Surtees Society (Durham, 1834), after Robert Surtees of Mainsforth, manuscripts dealing with the Northumbrian region; Abbotsford Club (Edinburgh, 1834-37), history, literature, and antiquities, English and Scottish; Camden Soc. (Lond. 1838), civil, ecclesiastical, and literary history of the United Kingdom; Spalding Club (Aberdeen, 1839-70; revived 1887), after the local historian, literature of north-eastern counties of Scotland; Parker Soc. (Lond. 1840-55), after Archbishop Parker, the fathers and early writers of the Reformed English Church; Percy Soc. (Lond. 1840-52), after Thomas Percy, ballad poetry; Shakespeare Soc. (Lond. 1840-53); Soc. for the Publication of Oriental Texts (Lond. 1841-50); Ælfric Soc. (Lond. 1842-56), Anglo-Saxon works; Chetham Soc. (Manchester, 1843), after Humphrey Chetham, works connected with Counties Palatine of Lancaster and Chester; Sydenham Soc. (Lond. 1843), medical literature; Spottiswoode Soc. (Edin. 1843-51), authors of the Episcopal Church of Scotland; Ray Soc. (Lond. 1844), natural history; Wernerian Club (Lond. 1844), scientific works; Cavendish Soc. (Lond. 1846), chemical science; Hakluyt Soc. (Lond. 1846), geography and travel; Arundel Soc. (Lond. 1848), important works of old masters; Early English Text Soc. (1864); Spenser Soc. (1867-68); Holbein Soc. (Lond. 1868), illustrated works; Ballad Soc. (Lond. 1868); Chaucer Soc. (1868); Harleian Soc. (1869), historical; English Dialect Soc. (1873); New Shakespeare Soc. (1873); Folklore Soc. (Lond. 1877); Index Soc. (1878); Wyclif (1882); Palæographical and Pipe Roll Socs. (1883); Palestine Pilgrims Text Soc. (1884); Scottish Text Soc. (Edin. 1883); Scottish History Soc. (Edin. 1886). Among the many similar societies in the United States, the oldest is the Massachusetts Historical Society (Boston, 1792). See Burton, *Book Hunter*; Martin, *Bibliogr. Cat. of Books privately printed* (1834); Hume & Evans, *Learned Societies and Printing Clubs of the United Kingdom*; *English Catalogue* (Appendixes); Bohn, *Appendix to Lowndes’ Bibliographer’s Manual* (1864); Growoll, *American Book Clubs* (N.Y. 1897); and the *Yearbook of Learned Societies*.

Book-keeping is the art of recording commercial and financial transactions in a regular and systematic manner. Its object is to preserve a distinct and accurate record of such transactions, and from a well-kept set of books a merchant should be able to ascertain at any time the state of his account with any person with whom he has dealings, and the profits or losses resulting from each venture or department of his business, his assets and liabilities, and the exact state of his affairs. The stability of a business depends to a very large extent upon the accuracy of the information thus conveyed, for without it, the trader, in ignorance or with only a vague idea of his true position, often proceeds upon wholly erroneous and inflated ideas of his resources, and is only awakened to the real state of matters by the impossibility of meeting his liabilities when they fall due. Many a bankruptcy may be traced directly to the

errors and confusion arising from neglect or carelessness in this department. But these considerations are far from being universally realised and acted upon by business men. Among the class of small traders especially, the time required for keeping books in proper order is grudged as being unremunerative, and the work, if done at all, is performed in a careless and inefficient way, frequently with the disastrous results above referred to. The necessity of keeping proper books has been recognised by the legislature. The Debtors Act (Scotland), 1880, contains provisions for the punishment of bankrupts who have failed to keep satisfactory books, and the English Bankruptcy Act (1883) has a similar clause. A merchant's books frequently constitute important evidence in a court of law, and they should for this reason, if for no other, be kept as neatly and carefully as possible; the presence of blots, deletions, and erasures, or the tearing out of pages, will render them liable to suspicion, and greatly lessen their value in this respect.

It is probable that at a very early period, so soon as trading transactions became too involved to be readily borne in mind, means would be found to keep some record of them. Thus we read in the Book of Ecclesiasticus (chap. xlii. 7), 'put all in writing that thou givest out or receivest in;' and excavations in Babylon have brought to light the records of a great banking-house inscribed upon the bricks or tiles which served the purpose of books. From certain passages in Cicero and Pliny it seems evident that the Romans understood something of *Debit* and *Credit*, so far, at least, as to make entries falling under these terms upon opposite pages. As an art, however, book-keeping appears to have arisen in the great mercantile cities of Italy during the 15th century, and the principles of double entry (*doppia scrittura*), under the name of 'the Italian method,' gradually spread over Europe, many languages still retaining the original Italian names as technical terms.

The earliest treatise, so far as known, on the subject was contained in an algebraic work by a friar named Luca Paciolo, which was published at Venice in 1494. The first work in English was Hugh Oldcastle's *Profitable Treatise*, published in London in 1543. E. T. Jones's *English System of Book-keeping* (Bristol, 1796) was long regarded as of supreme authority, and went through a score of editions. It was in reality a modified form of the Italian double entry.

Blunders and confusion frequently arise from the attempt to follow slavishly definite rules without an intelligent knowledge of their meaning, a comprehension of the general principles being much more important than a strict adherence to any particular style however excellent. It may fairly be said that a just appreciation of the terms *Debtor* and *Creditor*, which, abbreviated to *Dr.* and *Cr.*, are usually placed at the top of the left and right hand respectively of every account, affords a master-key to the whole subject. A person, or his account, is regarded in book-keeping as *debtor* for what he *receives*, and *creditor* for what he *gives*. Thus the value of goods sold to a person, or cash paid to him, is placed to the *debtor* or left-hand side of his account, while cash or goods received from him are entered on the *creditor* or right-hand side.

The details of book-keeping vary largely according to the nature and extent of the transactions which are to be recorded. Thus the shopkeeper's books differ from those of the great wholesale merchant, and these again from the books of banks, public companies, and government departments; but the same general principles underlie all, and

when once these are well mastered, they may, with the exercise of a little intelligence and ingenuity, be applied to every emergency.

There are two kinds of book-keeping in general use—SINGLE ENTRY and DOUBLE ENTRY. In the first of these, the only accounts kept in the ledger are those of the persons with whom there are dealings, and a statement of affairs is arrived at by adding together the debts due to the trader, and those due by him. To the former is added the value of any stock-in-trade or other property he may have, and the excess of these *assets*, as they are called, over the liabilities, is the amount of his *capital*. By comparing this figure with his capital at the last balancing date, and taking into account any sums he may have paid into or withdrawn from the business, he estimates his profit or loss for the period. But this is a manifestly crude and imperfect system, and most traders, even though they may not adopt double entry in its fullest and most elaborate form, import more or less of its principles in order to have some check upon the accuracy of their balance sheet and to gain information as to the details of their business.

Double entry is the true art of book-keeping, and it completely fulfils the requirements of clearness, completeness, and accuracy. Its theory is founded upon the obvious fact that every commercial transaction has two sides: if it is a *giving* by one person, it must be a *receiving* by another. Thus every sale involves a purchase, every debtor must have a corresponding creditor, and every creditor a debtor, and the double-entry system derives its name from recording both sides of each transaction. If an entry is made to the credit of any account in the ledger, there must be a corresponding entry to the debit of some other account. In this way the two sides of the ledger must always agree, or balance one another, and their failure to do so discloses the presence of an error—e.g. if a merchant buy a quantity of calico of the value of £50 from the manufacturers, A. B. & Co., he will place £50 to the *credit* of A. B. & Co.'s account, and the same sum to the *debit* of 'calico' account, which represents himself as the receiver. In the same way, if the calico is afterwards sold to C. D. & Co. for £60, that sum will be placed to the *debit* of C. D. & Co.'s account, and to the *credit* of 'calico' account. Many are deterred from adopting the double-entry system by an exaggerated idea of its complexity and laboriousness; and it would no doubt be most unwise for a tradesman with a small business to plunge into the most elaborate form of the system. But if his books are accurately kept by single entry it is possible to convert them yearly or periodically into double entry with very little trouble. This is done by casting up the purchases, sales, and expenses for the period, from which a goods account and profit and loss account can be constructed. Thus the principle of double entry is carried out, though roughly, and its check taken advantage of without multiplication of books, accounts, or labour.

The same books are used in both systems except the journal, which is peculiar to double entry, and a brief description of the most important books which would be kept by an ordinary merchant will serve to exemplify the general principles of book-keeping.

Day-book, or *Sales-book*.—This book contains a daily record of all goods sold. Under each day's date should be stated the name of the purchaser, and a full description of the goods—their quality, quantity, and the rate. If several items are sold to the same person on the same day, the various items are usually stated in an inner column, and the total amount extended to a second column.

Where this is done, a test of the accuracy of these additions is obtained by adding up both columns, the total of which ought of course to be the same. Cash sales—that is, goods paid for at the time of purchase—may be entered in one sum at the close of each day.

The *Invoice-book*, or *Purchase-book*, keeps a similar record of all purchases. It is written up from the invoices or accounts sent along with all goods received, and the invoices themselves are preserved either in files or by pasting them into a book called a *Guard Invoice-book*.

Cash-book.—In this very important book, all receipts and payments of cash are recorded from day to day. The two opposite pages of the book are used concurrently, the receipts being entered on the left-hand or debtor side, and the payments on the right-hand or creditor side. It is thus in form simply an *account current* between the cashier and his employers, all money received by him being placed to his debit, and all disbursements to his credit. On the two sides being summed up, the excess of the total receipts over the disbursements, called the *cash balance*, is the sum for which the cashier is accountable, and should agree with the cash actually in his till. This test should invariably be applied every day, as an error or omission becomes more difficult of detection the longer its discovery is delayed. Payments by means of cheques on the banking account, though they do not affect the actual cash on hand, are usually entered as disbursements on the creditor side, while a corresponding entry for the same amount, as if received from the banker, is made on the debtor side. It is also usual to have a separate column in which the discounts or abatements on each account paid or received are noted. The cash-book is also sometimes provided with several cash-columns on either side, so that transactions of the same kind may be collected together and added up separately. Thus the debtor side may be divided into bank entries, bills receivable, &c., and the creditor side into bank, bills payable, wages, charges, &c., the total in each case being extended into the last column.

Bill-book.—This book is a record, in the order of their date, of all bills receivable or payable by the firm, a separate book being usually kept for each. It should contain appropriate space for such particulars as—number of bill, date, name of drawer, indorser, and acceptor, currency and due date, amount, when and how paid or disposed of. See article **BILLS OF EXCHANGE**.

Journal.—The journal may be called the master-book of the double-entry system. It contains an abstract or synopsis of all the other books, the whole of the transactions being here digested under proper heads so as to facilitate their transfer to the appropriate accounts in the ledger. By the old Italian system, debit and credit entries were made in the same column of the journal, but the modern journal has two columns in each page, the first for debit and the second for credit entries, corresponding to the *Dr.* and *Cr.* sides of the ledger accounts. As the ledger contains precisely the same entries as the journal, though differently arranged, the summation of the columns of the latter for a given period should, unless a mistake has occurred, exactly agree with the aggregate of either side of the former. The subsidiary books are usually journalised, or abstracted into the journal, monthly. The strict rules of double entry require that no entry should be made in the ledger except from the journal, but to save time and labour the cash-book is often posted direct, the monthly totals only being passed through the journal, and some follow the same plan with the day-book and invoice-book. All sorts of cross

entries, or transfers from one account to another, must be made by means of the journal, which shows clearly where the corresponding entries are, and how the equilibrium of debtor and creditor is preserved.

Ledger.—The ledger (called in Fr. *grand livre*) is the most important of all the books. It exhibits under distinct headings the accounts of all persons with whom the merchant has dealings. It also contains accounts for every description of property and for outlay, such as wages and general expenses not chargeable to particular accounts. Here will ultimately be found, in a tabulated form, the contents of all the other books, the debits being on the left and the credits on the right hand side of the account. It has been already explained that in double entry all these entries should be posted from the journal, and that no entry can be made on either side of any account without a corresponding one being made on the opposite side of some other account. To balance a ledger, accordingly, the book-keeper must take down on a sheet of paper, or book for the purpose, the total sums on the debtor and creditor sides respectively of all the accounts. This is called a *Trial Balance*, and if the two sides agree, the accuracy of the work is demonstrated; if not, he must examine the transfers and additions till the error is discovered. This done, the balances of the various accounts instructing the gains and losses or expenses of the business are transferred by journal entry to *profit and loss* account, and the balance of that account in turn is carried to *capital* account or divided among the partners if there be more than one. The remaining accounts are then closed by transferring their balances to balance account; and the books are reopened for another period by a reversing entry bringing down the balances thus transferred to start a new account. A *Balance Sheet* is a statement of the merchant's affairs, and exhibits on the one side his whole assets, stock-in-trade, debts outstanding, property and furniture, and cash in bank or on hand. On the other side are his liabilities and his capital, which is just the excess of the assets over the liabilities. The following is a specimen of a balance sheet of the simplest description:

Balance Sheet of George White, Grocer, London,
as at 31st December 19—

Dr.	£	s	d.	Cr.	£	s	d.
To Sundry Creditors	1004	11	7	By Stock-in-trade	1385	3	8
" Bills Payable	256	18	9	" Sundry Debtors	1281	9	6
" George White,				" Bills Receivable	173	11	10
Capital a/c.....	1889	5	8	" Warehouse Furniture	125	15	0
				" Cash at Banker's	273	11	5
				" Do. on hand....	11	4	2
	3150	15	7		3150	15	7

Besides the books enumerated, others of a subsidiary kind are kept by most merchants, as a *Return Book* for goods returned by or to him, an *Order Book* where all orders are promptly noted, a *Warehouse Book* to keep account of all stock entering or leaving the warehouse, a *Package or Case Book* for barrels, cases, &c. to be returned, and *Account Sales Book*, showing the net proceeds of each cargo or consignment of goods, a *Letter Book*, and many others. The ledger is frequently, for convenience, kept as two or three separate books—Sales Ledger, Purchase Ledger, and Private Ledger—but they must, for balancing purposes, be considered as forming parts of one whole. In extensive businesses, each branch or department may have separate books of its own, the whole being brought to a general balance at periodic times.

The development of modern book-keeping is entirely in the direction of greater simplicity and clearness, and the avoidance of unnecessary labour

in transcription. Thus the journal has been practically abandoned in commercial book-keeping, the entries being posted directly to the ledger from the cash-book or day-book. Even the ledger is often supplanted by alphabetically arranged cards, on which the various accounts are inscribed.

The general principles of book-keeping have not been and probably will never be altered; but it must be borne in mind that no system, however perfect, will make up for slovenliness or carelessness on the part of the book-keeper, or for want of due oversight on that of the employer. The utmost regularity, vigilance, and honesty are required to avoid snares and fallacies, and there are some errors which the most elaborate book-keeping will not detect, but in some cases even help to conceal.

Book-keeping is taught in our schools as one of the branches of a commercial education; but of no subject can it be said with greater truth that a pinch of practice is worth a peck of theory. The bibliography is very extensive, and there are hand-books with specialised forms of book-keeping suitable for every trade and profession. For the history of the subject see Brown's *History of Accounting*. Among text-books of a general nature may be mentioned those of Carter, Inglis, Pitman, Cropper, Dicksee, Spicer and Pegler, and Jenkinson.

Bookland. See BÓCLAND.

Book-lice, various small animals which damage books. (1) Thus in the family Psocidæ, in the order Orthoptera, there are numerous minute wingless insects which shelter in books and among papers, and do especial damage to collections of insects. One of them (*Atropos pulsatorius*) was long credited with being the Death-watch. The closely allied *Troctes divinatorius* is a yet commoner pest of entomological cabinets. See DEATH-WATCH.—(2) Among beetles, too, in the wood-boring family, Xylophaga, *Ptilinus pectinicornis* is known to attack books with wood in the binding. See the article BORERS.—(3) Very different are the book-scorpions (Cheliferidæ) in the spider class (Arachnida). See BOOK-SCORPION, BOOK-WORM.

Book-making. See BETTING.

Book of the Dead. See DEAD (BOOK OF THE).

Bookplates. This is the somewhat awkward English name for labels of ownership frequently placed on the inside covers of books. Abroad these labels are styled *ex libris*. The use of bookplates is of some antiquity, and mention has been made of one dated in the middle of the 15th century, but at present the fine bookplates of Bilibaldus Pirckheimer (1470-1530), designed by Albert Dürer, hold the foremost place in point of time. Engraved English bookplates are not found of so early a date, but an old folio volume from Henry VIII.'s library, now in the British Museum, contains an elaborately emblazoned drawing which formed the bookplate of Cardinal Wolsey, with his arms, supporters, and cardinal's hat. The earliest English engraved bookplate at present known is that of Sir Nicholas Bacon, father of Lord Chancellor Bacon, which is dated 1574. The number of English examples dated previous to the Restoration which have come down to us are singularly few, but after this period the series is well represented, and some of these plates are of considerable historical interest. Samuel Pepys had several bookplates; those with his own portrait could not have been engraved before 1685, because he is described therein as Secretary to the Admiralty under Charles II. and James II., but the one with his initials and the crossed anchors

was probably engraved as early as 1668. The bookplate of Pepys's faithful friend, William Hewer (in whose house at Clapham the diarist died), is dated 1699. The date on the plate of the well-known alderman and Lord Mayor, Sir Robert Clayton, is 1679. The names of Bishop Burnet, William Penn, Robert Harley, Matthew Prior, Lawrence Sterne, David Garrick, Horace Walpole, John Wilkes, and Charles James Fox, may be mentioned among those found on the highly prized bookplates of the collectors.

The styles of design adopted by book-collectors for their bookplates have been very diverse. Some of these labels have contained merely the name of the possessor, but the majority are armorial, some are allegorical in design, and others are ornamented with miniature landscapes. Many distinguished artists have condescended to produce bookplates. The name of Albert Dürer has already been mentioned as the designer of Pirckheimer's two plates—one in which the allegorical and the armorial elements are united, and the other consisting of a large and bold portrait of the once celebrated senator of Nurnberg. Of English engravers, William Marshall and Robert White may be specially mentioned. Hogarth engraved a bookplate for John Holland, heraldic artist, and another for George Lambert the scene-painter. George Vertue and Thomas Worlidge also produced bookplates, and Thomas Bewick was at one time fully employed in their production. One of the prettiest of bookplates is that designed by Agnes Berry in 1793 for the Hon. Mrs Damer. This was engraved by Francis Legat. The earliest bookplates were of large size, as if made specially for folios, but a smaller size soon became general, a size which was used for both large and small books. Sir William Stirling Maxwell used a variety of sizes for differently sized books, and some of these bookplates were of gigantic proportions. The fashion of collecting bookplates is a very modern one, and not many years ago, while a label of special interest might be retained in a book, in most instances the bookplate of the latest owner was placed over that of the former one. The craze for collecting bookplates, apart from the books they once adorned, has little to be said in its favour.

In 1837 the Rev. Daniel Parsons published an article on bookplates in the *Third Annual Report of the Oxford University Archaeological and Heraldic Society*, and in 1851 he announced his intention of writing a history of bookplates, but this work was never produced. The Hon. J. Leicester Warren (Lord de Tabley) published in 1880 the first English work on the subject (*A Guide to the Study of Bookplates*; new ed. 1900), and in 1884 Griggs printed privately a very small edition of a work entitled *Eighty-three Examples of Armorial Bookplates*. See also, among others, the following works: Egerton Castle, *English Bookplates* (1893); Walter Hamilton, *French Bookplates* (1893); Poulet-Malassus, *Les Ex-libris Français* (2d ed. 1875); Dexter Allen, *American Bookplates* (1895); Vinycomb, *The Processes for the Production of Ex-libris* (1894); Sauler, *Art in Bookplates* (1895); Count zu Leiningen-Westerburg, *German Bookplates* (1901); and the 'Ex-Libris' Series.

Book-scorpion (*Chelifer cancrroides*), a small Arachnid, in appearance between scorpion and mite. It is like a small flattened scorpion without a tail. The front of the body is scorpion-like, and bears a transverse dorsal groove; the posterior body is flat, with 10 or 11 rings. There are two eyes; the respiration is by means of air-tubes; the eggs are

Book-scorpion.

carried about on the abdomen of the female. Spinning-glands are present, and the body is sometimes covered by the secretion. The size is about one-eighth of an inch, the colour brownish. The book-scorpion lurks among old books and papers, and probably helps their preservation by killing off and eating book-lice, mites, and other small insects. Upon the whole it likely does more good than harm. Other related forms are common under bark, moss, &c. Some species are found attached to the legs of house-flies, which not improbably indicates a partial parasitism. See ARACHNIDA, BOOK-LICE, SCORPION, SPIDER.

Book-trade. The business of dealing in books comprehends three classes of traders—Publishers, who prepare and dispose of books wholesale; Wholesale Booksellers, who distribute books to retail dealers; and Retail Booksellers, who sell books to the public. The latter class may again be divided into dealers in new books, in second-hand books, and in periodicals. Although ordinarily distinct, these classes may conveniently be treated together. While publishing apart from bookselling is of modern date, the selling of books is as old as the origin of literature. Manuscript copies of the works of authors were sold in the ancient Greek cities and in Rome. The first book of Martial's epigrams was to be had for an English equivalent of about three shillings; his other books for less. Slave labour was employed in transcription; and there were men who employed copyists and sold their work. Horace celebrates 'the brothers Sosii' as eminent booksellers (*bibliopolas*). In the middle ages the monks of various monasteries were in the habit of bartering the books they transcribed. But books were rare and costly because of the ignorance and the apathy of the public. With the foundation of several universities in the 12th century, the preparation and sale of books increased; but the trade of bookselling attained to importance only after the invention of printing. The first booksellers were also book-lenders, under the control of the universities. In 1292 the book-trade of Paris consisted of 24 copyists, 17 bookbinders, 19 parchment makers, 13 illuminators, 8 dealers in manuscripts; the last had increased to 29 in 1323. The business was more in lending than selling. Students at the English universities bought their books or received them on loan from the 'sworn stationers.' Some of the French kings and princes of the royal blood were liberal patrons of authors and all engaged in the production of books. Philippe, Duke of Burgundy (1396-1467) gave constant employment at Bruges to a host of authors, translators, copyists, and illuminators.

The first printers acted also as booksellers, and being mostly learned men, they were generally the editors, and, in some instances, the authors of the works which they produced. The manufacture of books had become such an important item of commerce that at Bruges (1454) and Antwerp (1450) a guild of booksellers, copyists, and allied trades was formed (see PRINTING). Fust and Schöffer, the partners of Gutenberg (q.v.), carried the productions of the Mainz press to the fair of Frankfort-on-the-Maine and to Paris. Some instances of division of the two branches, printing and bookselling, occurred in the 15th century. The founder of the Stephens (q.v.) family of printers and publishers had settled in Paris in 1502; Louis, the first of the Elzevirs (q.v.), was settled as a bookseller and bookbinder in Leyden in 1580. The press established by Aldo Manuzio, during one hundred years (1490-1597), printed 908 different works (see ALDINE EDITIONS). Plantin (q.v. 1514-89) of Antwerp had sometimes twenty presses at work.

Migrating from place to place, and resorting to the great continental fairs for customers, the early booksellers became known as *stationarii*, or stationers—i.e. occupiers of a 'stance' or station at a fair. The first stationers in England seem also to have engrossed what they sold. Caxton and Wynkyn de Worde chiefly issued translations. The Reformation caused a great demand for Bibles. The pedlars who frequented the country fairs were of some importance in the early days of bookselling. It was a common thing for government, in the 16th century, to enforce the printing of restrictions as to price on the last page of a book. The number of readers was but small, and in 1540 Grafton printed only 500 copies of his complete edition of Scripture. There exist 326 editions of the Bible or parts of the Bible printed between 1526 and 1600. Ames and Herbert record 350 printers at work in England and Scotland (1476-1600); at least 10,000 distinct works were printed during that period. The British Museum has a collection of over 2000 volumes of Tracts all relating to the period of the first English Revolution from 1640 to 1660, which include 30,000 separate publications. This was the era of the controversial pamphlet. Dr Johnson has remarked that from 1623 to 1664 the nation was satisfied with two editions of Shakespeare. The stock of books in sheets lost by the booksellers around St Paul's in the great fire of 1666 was of an estimated value of £200,000.

Whether settled or migratory, the early booksellers were subject to many restrictions. In England, the book-trade was trammelled by royal patents and proclamations, decrees and ordinances of the Star Chamber, licenses of universities, and charters granting monopolies in the sale of particular classes of works. In 1557 the Stationers' Company of London was constituted by royal charter, and exercised an arbitrary censorship of the press. The Crown, by an Act 13 and 14 Car. II. chap. 23, commonly called the 'Licensing Act,' assumed this species of control over the issue of books. The Licensing Act, and its renewals, ultimately expired in 1694. By the first Copyright Act, 8 Anne, chap. 19, the legislature interposed to protect the rights of authors, and to relieve them, as well as publishers, from the thraldom of the Stationers' Company. But by the same act, the Archbishop of Canterbury, the Lord Chancellor, and certain judges in England, and the judges of the Court of Session in Scotland, were empowered, on the complaint of any person, to regulate the prices of books, and to fine those who sought higher prices than they enjoined. This provision was in force till 1738, when it was abolished by the Act 12 Geo. II. chap. 36. From this time the book-trade was free.

Many of the bibliopoles who flourished in the 17th and 18th centuries have been rendered famous, not less by their enterprise and vigour of mind, than by association with the authors and wits of the period. Thomas Guy (1644-1724) is remembered in connection with the Bible-trade, and as the founder of Guy's Hospital; Cripps, the publisher of the seven folio editions of Burton's *Anatomy of Melancholy* (1621-76), according to Wood, 'got an estate by it'; John Dunton's (1659-1733) name has been preserved by Swift, and he is notable as one of the first men the Pretender purposed to hang at Tyburn, if ever he ascended the British throne, 'for having writ forty books to prove him a Popish impostor'; Jacob Tonson (1656-1736), Dryden's publisher, and satirised by the poet, was the first to popularise *Paradise Lost* and Shakespeare; Lintott (1675-1736) enriched himself and Pope with editions of the *Iliad* and *Odyssey*; Curll (1675-1748) was pilloried not only by the govern-

ment, but by Pope in his *Dunciad*; Richardson (1689-1761) was both novelist and printer; Johnson, who wrote the life of Cave (1691-1754), said Cave 'scarcely ever looked out of the window but with a view to the improvement of his *Gentleman's Magazine*.' Of the publisher of Thomson, Fielding, and Hume, he also said, 'I respect Millar, he has raised the price of literature.' One of the Newberys, bookseller and medicine vendor, was associated with Goldsmith, and is spoken of in the *Vicar of Wakefield* as 'the philanthropic bookseller of St Paul's Churchyard.' Ralph Griffiths is notable as the founder of the *Monthly Review* in 1749, and Dodsley of the *Annual Register* (1758). Joseph Cottle (1770-1853), the Bristol bookseller, was the friend and early patron of Coleridge, Southey, and Wordsworth. The names of Hutton, Cadell, Strahan, Baldwin, Rivington, Longman, Dilly, Lackington, were no less notable in their day than, in later times, those of Knight, of Edward Moxon, the friend of Lamb and publisher of the early works of Browning and Tennyson, and of John Murray.

In Scotland, after struggling through an age of restriction, the book-trade was developed about the middle of the 18th century. In Edinburgh it engaged Allan Ramsay, who published and sold his songs and his charming pastoral. Among his successors were Donaldson, Bell, Miller, Elliot, and Creech (author; publisher of the first Edinburgh edition of Burns), each eminent in his way; but it was mainly Archibald Constable (q.v.), the first publisher of the *Edinburgh Review* and *Waverley Novels*, and later William Blackwood (q.v.), the originator of *Blackwood's Magazine*, who raised the reputation of Edinburgh as a literary mart in the early part of the 19th century. That reputation has been maintained by W. and R. Chambers; by Adam and Charles Black (see BLACK, ADAM), first publishers of the *Encyclopædia Britannica*, whose house removed to London in 1892; by T. Nelson and Sons, well known for their educational and juvenile publications, series of novels, and reprints of standard works; by Oliver and Boyd; and by Bartholomew and Son, geographical publishers. The preparation of school-books has largely occupied the energies of the two principal publishing firms, while it is worthy of note that two of the most successful encyclopædias, the *Britannica* and the present work, emanated from Edinburgh. Glasgow, where the famous Foulis press had been at work in the 18th century, has during recent years become energetic in publishing, and many books, in educational and general literature, have been issued from local presses by Blackie, MacLehose, Collins, and others.

The purchase of books in the 15th and 16th centuries was confined to the nobler and richer citizens and scholars. In the 17th and 18th centuries the demand for books began to spread among the middle classes. The plan of issuing neat cheap editions of popular works was initiated (1760-70) by Alexander Donaldson, an Edinburgh bookseller (see DONALDSON, JAMES), and by John Bell, who in 1777 issued *British Poets, from Chaucer to Churchill*, which led to the famous meeting of forty members of the London book-trade in the Chapter Coffee-house, and to the publication of Johnson's *Lives of the Poets*. These were followed up by several publishers in London, one of whom, C. Cooke (1790-1800), issued an extensive series of cheap reprints, of a pocket size, called *Cooke's Editions*, commendable for tastefulness of preparation. In the early years of last century Suttaby's, Sharpe's, Walker's, and Dove's pocket editions were stock articles in the trade. About 1817-18 some enterprising booksellers began to break through certain old usages,

by issuing reprints of standard works, in a good style of typography, at considerably reduced prices. At the same time, numerous cheap periodicals made their appearance; but these, for the most part, were of so seditious, irreligious, and libellous a character that the law interposed by the Act of 1819. During the next ten years the only periodical that attained to permanent success was Limbird's *Mirror* (1822), an illustrated weekly sheet (see NEWSPAPER, PERIODICALS). In 1827 the Society for Diffusing Useful Knowledge began to issue its low-priced scientific treatises; and Archibald Constable commenced the cheap series of works in original literature called *Constable's Miscellany*. 'Though Constable in his grand style,' says Knight, 'talked of millions of buyers, he charged his little volumes 3s. 6d. each. He was right. The millions were not ready to buy such books at a shilling, nor even at sixpence. They are not ready now' (1854). All this changed, and as good value could afterwards be had for sixpence and a shilling.

Viewing all previous enterprises of this kind as fitful and insufficient, as well as unsupported by any breadth of appreciation, we have to refer to this period (1827-32) for the true origin of what is now designated the 'cheap press.' Taking advantage of the growing demand for cheap literature, and desirous of guiding it in a right direction, William and Robert Chambers (q.v.) of Edinburgh began, on the 4th of February 1832, to issue *Chambers's Edinburgh Journal*, a weekly sheet at 1½d.: on the 31st of March following appeared in London the *Penny Magazine* of the Society for the Diffusion of Useful Knowledge; and this was followed, July 7, by the *Saturday Magazine*, which was issued under the direction of a committee of the Society for Promoting Christian Knowledge. The success of *Chambers's Journal* led to the issue of *Information for the People*, *Cyclopædia of English Literature*, *Miscellany of Tracts*, and many educational and other works. Charles Knight (q.v.), first editor of the *Penny Magazine*, with his *Penny Encyclopædia*, and *Library of Entertaining Knowledge*, and other works, was another pioneer of the cheap press. Within twenty years he expended £80,000 upon copyrights and literary labour, and during the same period £50,000 upon paper-duty. The effect of the repeal of the advertisement-duty (1853) and of the paper-duty (1861) was to encourage the production of cheap literature. John Cassell's (q.v.) name survives in the firm he founded, along with his *Popular Educator*, *Family Bible*, and innumerable other works; Routledge's *Railway Library* and *Popular Library* of cheap novels, and shilling and sixpenny editions of standard works, were among the first-fruits of the ample crop of cheap editions. Bohn's Libraries are familiar to scholars and lovers of good literature all the world over. The Longmans, honourably connected with the London book-trade for more than a century and a half; Strahan, originator of *Good Words* (1860) and the *Contemporary Review* (1866); Smith, Elder, and Co., proprietors of the *Cornhill* (1860), and publishers of Thackeray and Browning, and of the *Dictionary of National Biography*; Macmillan and Co., publishers of Lord Tennyson's works, and those of men eminent in all departments of science and literature; Murray, J. M. Dent, Jack, T. Fisher Unwin, E. Arnold, John Lane, Hutchinson, Frowde, Hodder and Stoughton, Methuen, Heinemann, along with many others, all added their quota to the rapidly increasing volume of literature.

We have had the works of Shakespeare at sixpence and one shilling, and penny reprints of some classics. Well-printed threepenny editions of standard books, and portions of books, began to

be issued in 1886. For many years previously the *Bibliothèque Nationale* in France, and the *Universal-bibliothek* in Germany, had supplied the public on the Continent with standard literature at similar prices. There is now less reason for Ruskin's reproach that 'we call ourselves a rich nation, and we are filthy and foolish enough to thumb each other's books out of circulating libraries. . . . How much do you think we spend altogether on our libraries, public and private, as compared with what we spend on our horses?' The trade in light literature, and in cheap periodicals and newspapers, has been fostered by the railway bookstalls of Messrs W. H. Smith and Son, Wyman, and Willing in London, Eason in Dublin, and Menzies in Scotland. One reason for the cheapness of good books is the expiry of copyrights; in the case of such popular authors as Scott, Dickens, Thackeray, and Carlyle, it has led to the appearance of many competing editions, some of them very low in price.

The same generation, which witnessed a great reduction in the cost of books, has also had the privilege of purchasing the most luxurious and artistic *éditions de luxe*, frequently printed from type specially cast for the purpose, the illustrations in the highest style of art, and printed on china-paper. Shakespeare, Thackeray, Dickens, and isolated volumes, such as George Eliot's *Romola* and Blackmore's *Lorna Doone*, have been treated in this magnificent manner. To get up a book in this way necessitates the expenditure of many thousands of pounds. The trade in the manufacture of children's picture-books has assumed great dimensions. The best talent in literary and artistic circles has been employed in the production of books for the young. The bright and attractive books and periodicals for juveniles are often the envy of older minds. There are fashions in books, and the sale and use of Birthday Books (q.v.) led to an enormous business being done. The great improvements in Book-binding (q.v.), and abundance of illustrations in Christmas books, or books for presents, have given a stimulus to certain branches of the trade. The great bookselling season is from October to February, when the nights are long; during the summer, fiction and the lighter periodicals sell best. For the last three months of the year the wholesale booksellers have a hard time of it, executing orders for the various annual volumes of the periodicals, and Christmas literature of every kind. The practice which Dickens inaugurated of issuing Christmas numbers has grown enormously, and has been adopted with profit by many leading illustrated newspapers and periodicals. Good newspaper notices sometimes start the sale of a book; when it has begun to sell, if really good, its success proves its best advertisement. When a book has been issued at one guinea, or two guineas, after the richer public has been exhausted, a moderately cheap edition may be brought out at a price from 5s. to 10s. 6d., followed up at a proper interval, if the book is calculated for wide circulation, by an edition at 2s. 6d., or less.

The position of those who, in the hurry of business life, and in the time occupied in earning a living, have little leisure for solid reading has been abundantly catered for in the 'story' paper, and the lighter periodicals. Convenient abridgments, manuals, compendiums, and primers of almost every branch of knowledge exist; while many publishers have made quite a feature of 'condensed' lives of celebrities. See BIOGRAPHY.

The circulation of our weekly and monthly periodical literature is enormous, and can be calculated only by millions of copies.

As circulating libraries, by creating a taste for reading, led to the establishment of the cheap press, so, as might be expected, has the cheap press extended the sphere of literature, and given rise to public libraries and book-clubs. C. E. Mudie in 1842 introduced a new system of subscription lending library, and since then the firm have purchased many millions of volumes for the use of subscribers; so that in many cases what would formerly have been considered to be large editions are absorbed by one purchaser. After being used for several months, the surplus copies are sold at a cheap rate. The London Library is also well known. Messrs Smith's remarkable system of bookstall libraries was begun in 1858.

The selling of second-hand books from open stalls, and from Booths (q.v.), is a practice so ancient as to be connected with the trade of the stationarii of the middle ages. Some men of no little note in the book-trade began in the humble quality of stall-keepers. London is the chief seat of the second-hand book-trade; but it is also conducted on a considerable scale in Edinburgh, Glasgow, Manchester, Liverpool, Oxford, Cambridge, Dublin, Bristol, and other centres of wealth and intelligence. In many cases what are called 'remainders' of an edition are purchased and sold at a merely nominal price by the second-hand booksellers. But the dealers procure supplies chiefly at public auctions of the libraries of deceased clergymen, professors, and private gentlemen, of which sales there is a constant succession in London, Edinburgh, and elsewhere. At these auctions good editions of standard books may usually be obtained at moderate prices; but rare and curious works, prized by the 'bibliomaniac,' frequently bring very high sums. See BIBLIOMANIA. Dealers in second-hand books send catalogues to their customers throughout the country, and from this source not a few private libraries are mainly made up. Large quantities of second-hand high-class works are purchased for public libraries forming in the United States. From France, Italy, and Germany there has been a similar export-trade in fine old editions to North America.

The *Canvassing-trade* consists in the disposing of books mostly in weekly and monthly numbers or parts by a system of house-to-house visitation. Smollett's *History of England*, Stackhouse's *History of the Bible*, and Scott's *Bible* are early examples of successful publication in number form. Amongst modern authors, Thackeray, Dickens, and George Eliot tried the part form of publication with success. There are also various societies in this country employing book-hawkers or colporteurs, who visit outlying districts which are not reached by the ordinary bookseller.

Apart from the general trade, the publication of small books, tracts, and periodicals is carried on to a large extent also by associations for religious purposes, the funds for which are raised by voluntary subscription. See the article TRACT SOCIETY.

Another distinct kind of trade is that of printing and publishing authorised versions of the Bible, New Testament, and Book of Common Prayer. The preparation of these works has always been a prerogative of the crown, which grants exclusive privileges or patent rights to certain parties for the purpose. According to old usage, England, Ireland, and Scotland are treated separately. The last patent for England was granted by George IV. to Andrew Strahan, George Eyre, and Andrew Spottiswoode, for a term of thirty years; and having commenced on the 21st of January 1830, it expired on the 21st January 1860, and was then renewed during pleasure. The universities of Oxford and Cambridge have, by royal charters, enjoyed the

right of printing Bibles, &c., in common with the patentees; but as the King's printers represent the owners of the copyright, the privilege of prosecution for infringement belongs to them alone. In the case of the revised version of the Bible, issued in 1881 and 1885, the university authorities purchased the copyright from the revisers, and consequently have the sole right of publication; over one million copies of the New Testament were sold (by the Oxford University Press alone) on the first day of its appearance. See PATENT.

In Ireland, George III. in 1766 granted a Bible patent to Boulton Grierson for forty years. He was succeeded by his son, George Grierson, who in 1811 obtained a renewal. Trinity College, Dublin, had also a concurrent right. In Scotland the last patent expired in 1839, and was not renewed. The crown appoints a Board with authority to grant licences to parties desirous of printing editions of the Bible and other books falling within the royal prerogative, such as the Confession of Faith.

The modification of the patent having tended to lower prices, the possibility of any further material reduction seems doubtful. One noticeable feature of the trade in Bibles is that the publishers in England sell large numbers in sheets to the various religious societies, such as the British and Foreign Bible Society and the Society for Promoting Christian Knowledge, who issue editions to the public under cost price. From their cheapness, but more particularly from their accuracy, English-printed Bibles and New Testaments are purchased in large quantities by the United States. The Oxford University Press now carries on the whole process of Bible production within its own premises.

Although the printing of the authorised version of the Bible, the New Testament, and the Book of Common Prayer seems to be reserved to the nominees of the crown, practically no objection is taken to the printing of these works by others. Translations of the Bible, other than the authorised version, are also issued freely by Roman Catholic and other bodies.

The universities of Oxford and Cambridge, the four Scottish universities, and the colleges of Eton, Westminster, and Winchester obtained an act of parliament, 15 Geo. III. chap. 53, giving them a perpetual copyright of all works belonging to them, or which might afterwards be bequeathed to or given to them, provided such works are printed at the university or college presses. The only works in existence older than last century, claimed by any of the above institutions, to which any value can be attached, are Clarendon's *Life*, and his *History of the Rebellion*, with its continuation. The right to this and other works possessed by the university of Oxford was confirmed by the Copyright Act (5 and 6 Vict. chap. 45). The profits of the first edition were applied towards the erection of the 'Clarendon Building' (1713).

The British book-trade is centred in London, though carried on to a considerable extent in Edinburgh, and to a less degree in Oxford, Cambridge, Liverpool, Manchester, Dublin, Glasgow, and a few other places. The London book-trade is partly carried on in distinct departments: miscellaneous literature, law books, medical books, educational treatises, periodicals, &c. respectively engage the attention of publishers; and as regards religious books, each sect may be said to have publishers and booksellers of its own. Some houses, notably Charles Griffin and Co. (under Mr F. J. Blight) have specialised in technical books. The larger number of the publishing and commission houses are situated in Paternoster Row and the streets adjoining; so that this part of the city has become the great and acknowledged market for literature. Covent Garden and Fleet Street are

likewise centres of the business. Between the country booksellers and the leading publishers and commission-houses a continual correspondence is kept up. In addition to his daily or weekly parcel every provincial bookseller makes up a monthly order for magazines, periodicals, and books.

In the infancy of the trade, authors frequently resorted to the plan of getting friends and patrons to subscribe for copies of their forthcoming works, the publisher in such cases acting only as commission-agent. Literature has now risen above this degrading system. At present (1) the author sells his work in manuscript to the publisher for a specified sum, giving him an assignment of the copyright, and leaving him to bring out the work according to his own taste; or (2) the author retains the copyright, pays all expenses, undertakes all risks, and gets a publisher to bring out his work; or (3) the author, retaining the copyright, incurs no risk, and only allows the publisher to print and issue an edition of a certain number of copies for a sum agreed on; or (4) the author and publisher issue the work at their joint risk, in that case sharing equally in profit or loss, or on such other terms as are mutually agreeable; or (5) the publisher agrees to issue the works of a popular author at his own risk and expense; the clear profits are divided into three equal shares, one of which is paid to the author, and two retained by the publisher, or the author may receive half-profits, which in the case of a 5s. book may amount to 9d. or 1s. a copy; or (6) by the familiar 'royalty' system the publisher takes whole or partial risk and pays the author a certain sum per copy, after the disposal of a specified number of copies. Under the French system the publisher takes the book, and makes what he can of it, but pays the author a royalty. Under the French law the printer is forbidden to print copies except by order of the author.

Publishing is an exceedingly hazardous profession, and those engaged in it must possess wide and special knowledge, else they may soon lock up their capital unprofitably, and fill their warehouses with waste-paper. This is especially the case in dealing with literature which is sold at a very small advance upon the actual cost of paper, print, and binding. Attached to the larger publishing houses are men who read and give judgment on the manuscripts submitted to their care, when this is not undertaken by the head of the firm. Works of which the highest expectations are formed may not pay expenses; and books of a seemingly worthless kind may prove exceedingly remunerative. Ruskin objected on principle to the booksellers' system of discounts and abatements: after 1873 he severed his connection with his former publishers, and appointed an agent of his own, who issued new editions of most of his writings. This led to the rise of the firm of George Allen and Sons. Ruskin, however, had to relax this rule of selling at a fixed price, and allow the booksellers a discount of 10 per cent. An 'Incorporated Society of Authors' was founded to watch over the interests of authors, and to support the Copyright Association (composed of publishers and authors) in furthering the establishment of the International Copyright Union.

Milton's agreement with Simmons the printer, disposing of the copyright of *Paradise Lost* for five pounds, is an oft-quoted but inadmissible argument against publishers, as a larger sum was paid, and at that time it might even have been a losing bargain. It would be easy to cite many publishers' blunders, in at first refusing works which, when issued, have taken their place amongst the classics of literature. Publishers as a rule are high-minded, fair, though keen men of business, and it is quite

to their advantage to treat an author well. There have been cases of gross injustice, but when an author's books find a ready market he reaps a ready benefit. If we take fiction, we find many instances of large sales and large earnings. Scott's income from his pen ranged from £10,000 to £15,000 per annum for many years. He is said to have received £110,000 for 11 novels and 9 volumes of tales. *Woodstock* alone yielded him £3228, and his *Life of Bonaparte* (2 editions) £18,000. Thackeray, when he became famous, was well paid for every line he wrote, and received a handsome salary for editing the *Cornhill*. For several novels Trollope and Dickens each received more than £3000, while the bargain for *Edwin Drood* was £7500 with a share in after profits. Routledge paid Lord Lytton £20,000 for the right to publish a cheap edition of his novels for ten years. George Eliot was paid £40,000 cash down for the first sales of her various books; for *Felix Holt* she was paid £5000, *Romola* £7000, and *Middlemarch* £8000. Macaulay received a cheque for £20,000, being his share of the profits of two volumes of his *History*. Browning received 100 guineas for his ballad 'Hervé Riel' in the *Cornhill*. These may be thought exceptional payments, but the rule holds good that where an author finds a large public, he secures a willing publisher and large payments.

In publishing new books, the copyright, setting up the types, author's corrections, stereotyping, press-work or printing, paper, binding, advertising, and presentation copies to editors for review, all need to be taken into account. When the author retains the copyright, the publisher charges, besides the above items for printing, &c., a commission on the sales of the work. Editions of a book are frequently wanted for an export order, or sets of stereotype plates are purchased by publishers in the United States or Canada, in order to print from. New books are issued at a certain selling price to the public, and the publisher allows a percentage off the price to the retail bookseller. In a large proportion of cases there is interposed the commission-agent or wholesale dealer. A new book on the eve of publication is offered to the trade at a slightly cheaper rate than at a later date. At the trade sales, which are now less common than formerly, some publishers do a large business.

Throughout the more respectable part of the trade there is a constant effort to maintain unbroken prices; for when a book can be obtained by booksellers below trade-price, it is essentially ruined for all regular business. On the other hand, the practice has become very general among retail booksellers of selling new books to the public at prices little above cost. This system of underselling has caused much disquietude in the trade. Mr Sampson Low was secretary of a trade association (abolished 1852) which had for its object the protection of the bookseller against underselling. For a long time resolute attempts were made by the heads of the profession to refuse to deal with undersellers; but these, appealing to the public, ultimately conquered; and now books of all kinds are disposed of at such prices as the bookseller pleases, unless in the case of those published at a net price. The development of the net system has helped to preserve the bookseller from extinction, as the usual discount given on new books left him a very bare living. After making all ordinary deductions, to which losses, &c., may be added, publishers can reckon on receiving little more than half the price at which their books are nominally issued. Many publishers annually spend very large sums in advertising new books.

Publishers are under the legal obligation to

deliver, free, a copy of every book they issue (new editions without alterations excepted) to the following public institutions: Library of the British Museum; Bodleian Library, Oxford; University Library, Cambridge; Trinity College Library, Dublin; National Library of Wales, Aberystwyth; and the National Library of Scotland, Edinburgh. Lord James and Sir Richard Webster gave in 1887 a decided opinion that copies of every American book issued in Great Britain, though printed and originally published in America, must also be sent to the British Museum. Manufactured American books are imported in large quantities by British publishers, who, for the convenience of purchasers, print on the title-page the name of the firm which has introduced the work into Great Britain; hence the claim of copies by the British Museum. There is no compulsion as to registration of titles at Stationers' Hall, the fee for which is 5s. (see COPYRIGHT). The title of a popular book or periodical is often of great value, and is jealously guarded by the publisher; the use of this title by another is an infringement of copyright. Owing to the rapid multiplication of books, it is becoming increasingly difficult to steer clear of titles already in use. The works acquired by the British Museum under the Copyright Act are more numerous than those purchased or presented. See BRITISH MUSEUM.

The gradual development of the book-trade may be studied in the catalogues. One of the first catalogues compiled in England (1666-80) has a list of 3550 works, showing a yearly average of 253. From 1700 to 1756, without including pamphlets, 5280 new books were issued. The *Modern Catalogue of Books* (1792-1802) has a list of 4096 new works, or an annual average of 372 new books. In the *London Catalogue* of 1800-27 the publications, including reprints, amounted to 19,860 volumes; that of 1816-51 contains the titles of 45,072 books, an average annual publication of more than 1200 books. There were three times as many books published in 1853 as there had been in 1828. The annual production of new books in the period 1877-87 averaged 4000 volumes; of new editions, 1400. The number of new books issued during 1913 was 9541; the new editions, 2838; for 1919, 7327 and 1295; and for 1921, 8757 and 2266. But there is no compulsory registration, and the only statistics available are based on the compilation of *The English Catalogue*. In the United States 7625 new books and 969 new editions appeared in 1919, 7336 new books (including 2235 pamphlets) and 1086 new editions in 1920. Of these last 6831 were by American authors, 615 by foreign authors but of American manufacture, and 976 imported. At the beginning of the 20th century the remarkable cheapening of paper, the use of labour-saving machinery, the cheapening of illustrations, and the use of coloured illustrations were striking features in book production. Cheapness, it seemed, could scarce go further than in *Everyman's Library* and kindred series. Another feature was the luxuriant crop of novels, not in the old three-volume form, which practically ceased after 1897, but in one volume at 6s., as the standard size and price, with plentiful issues and reissues at 2s., 1s., 7d., and 6d. These are sold in millions, and appeal to the whole civilised world. Prices, of course, rose during and after the Great War. Advertisements of highly priced books on the instalment system have diverted much business from the usual trade channels, as did also the founding of the *Times Book Club* (1905). The literary agent also changed the direct method of dealing with publishers, more to the advantage sometimes of the author of reputation. The Authors' Society exists for the protection of the rights of the author; the booksellers have their associations also; while the

Publishers' Association of Great Britain and Ireland stands for the producers of literature.

In Germany, where the book-trade first became established, the principal mart was Frankfurt, to whose fairs the early booksellers and printers resorted. Leipzig also became a great mart for books as early as 1680; but in 1885 as many books were published in Berlin as in Leipzig; and since about 1830 Stuttgart also has come to the front, whilst Frankfurt has entirely lost its ancient prestige. From the teeming press of Bernhard Tauchnitz of Leipzig there have been issued, by arrangement with British and American authors and publishers, thousands of volumes of cheap reprints of English popular works in a pocket size. The bringing of these German reprints of English copyright works into Great Britain is against the law, and copies are liable to seizure. Book-buyers in Germany have the privilege of receiving books on approbation from the booksellers and publishers: in this way an examination can be made of the proposed purchase, which may be returned.

Though Germany has the largest number of new books of any country in Europe, editions are relatively small; and the encouragement to men of letters is poor. Great use is made of the circulating library, upon which the publisher mainly depends for the sale of a popular work. Some of the illustrated papers have an enormous circulation.

In France every book and pamphlet must be registered before publication, and publishing is carried on chiefly in Paris, where there are many extensive printing establishments. About two-thirds of all the books published issue from Paris. A large number of the scientific works are published at the sole cost of the state. French books are, with few exceptions, done up simply in coloured paper covers, for temporary service; works of a superior class are executed with a high degree of taste—the excellence of pictorial embellishments being always conspicuous. The finest *éditions de luxe* used to be French; and many expensive works in French, and also in the classical languages, issued from the Parisian press still command a large sale. Owing to the almost universal knowledge of the French tongue, there is a large export to foreign countries.

Belgium possesses a flourishing book-trade; and Brussels, as a kind of minor Paris, is the seat of some extensive printing and publishing concerns. In Italy there has been a revival in book-publishing and bookselling. The trade of the other European countries is of less interest.

The book-trade of the United States sprang up from small beginnings within the 19th century. Hezekiah Usher was in business in Boston in 1652; bookselling was well established at the beginning of the 18th century. Benjamin Franklin (q.v.) was one of the most famous of the early printers. But at first scholars and libraries were mainly supplied with books from Europe, and the bulk of American publications were reprints of British literature. A few of the larger publishing houses, such as Harper's in New York, and Lippincott's in Philadelphia, print, bind, and manufacture the books they sell. The Harpers were the original American publishers of Scott, Dickens, Bulwer, George Eliot, Thackeray, Trollope, and Meredith; see *The House of Harper, 1817-1912*, by J. H. Harper (1912). The names of Appleton, Houghton, Mifflin and Co., Scribner, Doubleday Page and Co., Stokes, Dalton and Co., are well known. A very large proportion of the book business is done by book-agents or canvassers. At the fall and spring trade sales a large business is done, both in new publications and in older standard works, at a discount of from 25 to 40 per cent. off the usual trade prices. Local booksellers have suffered through the commission-agents

and library associations who deal directly with publishers.

A common arrangement between the American author and publisher is a payment of 10 per cent. royalty on the retail price of all sales; sometimes a lump sum is paid, and the publisher secures the copyright, which is granted for twenty-eight years, subject to renewal by the author, his widow, or children, or failing these his executors, or if there be no will his next of kin, for other twenty-eight years. A condition is that a copy of a title-page must be registered with the librarian of congress, and two copies of the best edition of the book lodged there within ten days of publication. A copy of any new edition must also be sent to the librarian.

American books are now executed with great neatness and taste; their wood-engravings, notably those in *Harper's*, *The Century*, and *Scribner's Magazine*, have been brought to a pitch of remarkable beauty both in design and in printing, largely by help of improvements in process engraving. All these magazines have gained a firm footing in Great Britain. The *Atlantic Monthly* and the *North American Review* have had as contributors and conductors some of the most eminent literary men that America has produced. Several English publishers have found it to their interest to have branch establishments in New York, while several American publishers have also branches in London. The methods of American book distribution differ from those in Britain in that general stores largely take the place of the bookseller. The net system was partially adopted in 1901.

The 'libraries,' collections of cheap reprints of British copyright books, extended some of them to more than 500 volumes. Of a former edition of the present Encyclopædia there are several unauthorised reprints. There was a reprint of all Ruskin's works at a much lower figure than one of his earlier books once cost in England; while his *Sesame and Lilies*, *Crown of Wild Olive*, and *Ethics of the Dust* appeared in one volume for about 2s., or about one-eighth of what Ruskin charged for them in England. Froude's *Carlyle* and George Eliot's *Life* could be had for fewer pence than they at first cost shillings in England. When the average published price of Black's or Blackmore's novels in England was 6s. a volume, they could be bought in New York at 10 or 20 cents. But since the granting of copyright to works set up and printed in the United States (1891) arrangements between Britain and America have been on a more satisfactory footing. Unauthorised reprints imported into the United Kingdom were liable to seizure by the custom-house officers. On the other hand, American books have often been reprinted in England without anything being paid to the author. See COPYRIGHT.

The modern bookseller and publisher has many trade helps, the best of which are the following: *The London Catalogue*, giving a list of 42,340 works published between 1831 and 1855; the *British Catalogue*; the handy and useful *English Catalogue of Books* (published annually); Whitaker's *Reference Catalogue of Current Literature* (first issued in 1874), which is a volume of publishers' catalogues in alphabetical order, modelled on the late F. Leyboldt's *American Trade List Annual*; Roobach's *Bibliotheca Americana*, a catalogue of books issued from 1820, continued by Kelly, in supplements, to 1871; and the *American Catalogue of authors and titles*. Sonnenschein's *Best Books* (1887; 2d ed. 1891) can be recommended. The recognised trade journals are in this country the *Bookseller* (monthly) and *Publishers' Circular* (weekly), in the United States the *Publishers' Weekly* and *American Bookseller*, all of which issue Christmas numbers containing announcements and criticisms of books, with specimens of the illus-

trations. In Germany the *Borsenblatt* is the organ of the trade, and there is a copious Geiman encyclopedia of the book-trade, edited by Ebner and Weisbach (1887).

Blight, 1921); and the articles BIBLIOGRAPHY, BOOK, BOOKBINDING, BOOK-CLUB, COPYRIGHT, ILLUSTRATION, LIBRARY, NEWSPAPER, PAPER, PERIODICALS, PRESS, PRINTING, STATIONERS' HALL, STEREOTYPING, TYPES, TYPE-SETTING MACHINES, WOOD-ENGRAVING.

Bookworm, any grub which feeds on the paper of books. The name more especially belongs to the larva of an anobium (*Anobium pertinax*, *A. eruditum*, &c.), a small coleopterous insect, which is one of the Death-watch (q.v.) insects; though the larva of *Ecophora pseudospictella*, a small brown moth, seems to have nearly an equal claim to it. The latter much resembles the anobium, save that it has six legs, while the anobium has none. Most people are familiar with the effects of the bookworm's ravages; but the creatures are extremely rare in this country, especially since so many chemical substances have been introduced into the manufacture of paper. In Southern Europe, the book-eating anobium is still common enough. It is not unlike the little grub found in hazel nuts—has a soft body with a horny brown head and strong jaws, and readily succumbs to exposure. As it usually attacks from the boards inwards, the interior pages of a book are generally safe from its ravages; though M. Peignot asserts he found twenty-seven volumes standing in a row, pierced from end to end by a single worm-tunnel, and Mr Blades has known this happen with at least two volumes. In America, books in libraries, though free from the ravages of the bookworm, are infested and damaged by a small cockroach—the Croton Bug, or *Blatta Germanica*. Probably several kinds of caterpillars of moths, and grubs of beetles, injure books more or less. See BORERS, BOOK-LICE; Blades, *Enemies of Books* (new ed. 1888); *N. and Q.*, May 1885; *Booklore* (1886); *Antiquary*, vol. x.; Butler, *Our Household Insects* (1893); O'Connor, *Facts about Bookworms* (1898).

Boole, GEORGE, a distinguished mathematician and logician, was born at Lincoln, 2d November 1815, and received his education mainly from his father, an intelligent tradesman. He successfully started a school at Lincoln in 1835; devoted his spare time to study, and in 1849 became professor of Mathematics in Queen's College, Cork, a post he held till his death, 8th December 1864. He had long been one of the foremost mathematical

thinkers of his time. Among his publications are *Analytical Transformations* (1839), *General Method in Analysis* (1844), *Mathematical Analysis of Logic* (1847), and papers on Probability. His fame as a logician chiefly rests upon his *Laws of Thought* (1854), a work of great originality and power, in which classes of objects and ideas, denoted by mathematical symbols, are dealt with by the ordinary rules of algebra, so that logical results are obtained by mathematical processes.

Boom, a town of Belgium, 10 miles S. of Antwerp, with great brick and tile works, breweries, tanneries, rope-walks, sailcloth manufactures, salt-works, and shipbuilding yards; pop. 20,000.

Boom, in a ship, is a general name for the long spars which jut out from certain supports or uprights, to stretch or extend the bottom edge of sails. According to their connections, they receive the names of jib-boom, flying jib-boom, main boom, square-sail boom, &c. In the old 110-gun ships of Nelson's days, these booms varied from 57 to 32 feet in length. Modern ironclads are provided with a number of booms to be fitted at intervals along their sides, from which may be suspended a huge net encircling the ship at a sufficient distance from the side to render an explosion from an enemy's torpedo harmless. The term boom is also applied to a strong iron chain, or a combination of spars, &c., lashed together with chains and cables, and employed in baring the navigable passage of the mouth of a harbour or river. The wooden boom across the harbour was an important feature in the famous defence of Londonderry in 1689. The Russians barred the entrance to the harbour of Sebastopol by a barrier of sunk ships and booms. When Farragut's fleet attacked New Orleans in 1862, it had to destroy formidable chains across the river buoyed on hulks. And see DUNDONALD.

Boomerang, a wooden missile used by the aborigines of Australia in hunting and in war, is found also in the New Hebrides and elsewhere. It is made of the green wood of the acacia or other hard tree treated by fire, is curved, and is from 2 feet to 2 feet 9 inches long by from 2 to 3 inches broad. It has one side convex, the other flat, with a sharp edge along the convexity of the curve. The curve varies greatly in different instruments.

Various Forms of Boomerang.

When to be thrown, it is taken in the hand by the handle (which has cross cuts on it), and held up at arm's length over the shoulder. With the convex edge forward and the flat side down, it is then thrown directly onward with a strong quick fling, as if to hit some one 40 yards in advance. The hand is drawn back at the same time, with a movement like that in the 'screw-back' stroke at billiards. The missile slowly ascends in the air.

whirling round and round, and describing a curved line of progress till it reaches a considerable height, when it begins to retrograde, and finally, if thrown with sufficient force, falls 8 or 10 yards behind the thrower, or it may fall near him. This surprising motion is produced by the bulged side of the missile. The air impinging thereon, lifts the instrument in the air, exactly as by hitting the oblique bars in a windmill, it forces it to go round. It should be added that the path of the boomerang can be varied by the will of the thrower, and that the sweep of no two boomerangs exactly agrees. The force with which it flies is great; the Rev. J. G. Wood saw a dog killed on the spot, and nearly cut in two by the stroke. The ingenuity of the contrivance, and the skill with which it can hit the mark aimed at, are very extraordinary as coming from almost the lowest race of mankind. Attempts have been made to derive it from some hypothetical high culture, but the intermediate forms between it and the war-club or battle-axe have been found in its own country, and there are good grounds for considering it really a native invention developed through such stages to its present form. 'Various missiles,' says Tylor, 'have been claimed as boomerangs: a curved weapon on the Assyrian bas-reliefs, the throwing-udgel of the Egyptian fowler, the African *liisan* or curved club, the iron *hunganunga* of the Tibbús, but without proof being brought forward that these weapons, or the boomerang-like iron projectiles of the Niam-Niam, have either of the great peculiarities of the boomerang, the sudden swerving from the apparent line of flight, or the returning to the thrower.' The returning boomerang is a toy; the war boomerang does not normally return.

Boondee. See BUNDI.

Boone, DANIEL, a famous American pioneer, was born in the state of Pennsylvania, February 11, 1735. At an early period of his life he emigrated to North Carolina; but his love of the wilderness not being sufficiently gratified there, he planned an expedition into Kentucky, then almost unknown. In June 1769, along with five companions, he halted on the Red River, a branch of the Kentucky. After a few months' hunting, he was captured by the Indians, but soon escaped, and accidentally falling in with his brother, who had pursued his track, lived with him in a cabin during the whole winter. In May 1770 his brother went home, and Boone himself was left alone in the perilous forest. In July his brother returned, and after exploring a considerable portion of country, they returned in 1771 to Carolina, determined to emigrate with their families to Kentucky; but the opposition of the Indians rendered the attempt unsuccessful. Shortly after, Boone was engaged as the agent of a Carolina company in purchasing the land on the south side of the Kentucky River, and here in 1775 he built a stockade-fort on the site now occupied by Boonesborough. In 1777 the place was twice attacked by a swarm of Indians, who, however, were repulsed. In 1778 Boone was once more captured, but once more managed to make his escape and reach the fort in time to repel, with his little garrison of fifty men, another determined Indian attack. On the admission of Kentucky to the Union, Boone lost his property for want of formal titles, and retired in 1798 in disgust into the wilderness of Missouri, which did not become United States territory till 1803. In 1812 his claim to a tract of land was allowed in recognition of his public services. He died in 1820.

See *Lives* by Filson (1784), Peck (1856), Bogart (1854), Abbott (1875), Thwaites (1902), Bruce (1910), Gulliver (1916).

Boone, a city of Iowa, 43 miles NW. of Des Moines, with flour-mills, tile-works, and potteries, and trade in coal, grain, and live-stock; pop. 12,500.

Boonville, (1) a city of Missouri, 100 miles E. of Kansas City, with manufactures of earthenware, bricks, carriages, leather, and tobacco; pop. 5000.—(2) A city in Indiana, 18 miles NE. of Evansville; pop. 4500.

Boorde, or BORDE, ANDREW, facetiously styled by himself 'Andreas Perforatus,' was born about 1490, near Cuckfield in Sussex, and brought up a Carthusian, but about 1528 got a dispensation from his vow and studied medicine, as he tells us, at Orleans, Toulouse, Montpellier, and Wittenberg, travelling moreover as wide as Rome and Compostella. On his return to England, he was patronised by Cromwell, and afterwards travelled in his behalf on a confidential mission through great part of France and Spain. The year 1536 he spent in practising and studying medicine at Glasgow, and tells us that he found the natives flattering and false. He next returned to London, thereafter crossed the seas and travelled by Antwerp, Cologne, Venice, and Rhodes to Jerusalem. After his return, he lived a while in London, then most likely in Winchester, where his flagrant immoralities soon brought him into serious trouble. In the spring of 1549 he found himself in the Fleet prison in London, and soon after he died. Boorde's chief works are his *Dyetary* and the *Fyrst Boke of the Introduction of Knowledge*, edited by Dr Furnivall for the Early English Text Society in 1870. His *Itinerary of Europe* has perished, but the *Handbook of Europe* survives, and the *Itinerary of England* or *Peregrination of Doctor Boorde* was printed by Hearne in 1735. Many books, moreover, have been fathered on the fantastic old reprobate, and some have asserted that he was the original 'Merryandrew.' The earliest known specimen of the Gypsy language occurs in the *Introduction*.

Boos, MARTIN, a Catholic priest, born 25th December 1762 at Huttenried in Bavaria, was from about 1790 the originator of a religious movement closely akin to those of the Protestant Pietists. From 1806, when he settled at Gallneukirchen, his influence spread widely among the Catholic laity, and extended to about sixty of their priests. Himself a staunch Catholic, he was often and bitterly persecuted, till in 1817 the Prussian government appointed him a professor of theology and teacher of religion at Dusseldorf. In 1819 he removed to Sayn, near Neuwied, and died there 29th August 1825.

Boot. See BOOTS AND SHOES.

Boot, also called BOOTS, or BOOTIKIN, an instrument of judicial torture, formerly used in Scotland to force confessions from persons accused of crimes, or answers from unwilling or suspected witnesses. Bishop Burnet in the *History of his Own Time*, and Sir Walter Scott in his *Old Mortality*, speak of the boot as made of iron; but the Rev. Thomas Morer in his *Short Account of Scotland* (1702), written from personal observation of the country at a time when the boot was still in use, describes it as 'made of four pieces of narrow boards nailed together, of a competent length for the leg, not unlike those short cases we use to guard young trees from the rabbits.' One or both legs of the person to be tortured having been placed in this case, wedges were inserted between the limb and the sides of the case, and these wedges were driven down by the executioner with a mallet or hammer, questions being at intervals put to the sufferer, until either he gave the desired information, or fainted away, or showed such endurance as satisfied the judges that no answer

could be extorted from him. In one case—that of a lad in Orkney in 1596—it is recorded that they struck as many as fifty-seven times. In another—that of John Fian, schoolmaster at Prestonpans, burned for sorcery in 1591—the victim 'did abide so many blows, that his legs were crushed and beaten together as small as might be, and the bones and flesh so bruised that the blood and marrow spouted forth in great abundance, whereby they were made unserviceable for ever.' 'Still,' it is added, 'he would not confess;' and, indeed, it is remarkable in how many cases we are told that the torture, agonising as it was, failed in its purpose. When the boots were first used in Scotland is not known. In a case where a deed of conveyance of land was challenged as a forgery in 1579, two witnesses, a clergyman and a notary, both of Forfarshire, were ordered to be 'put in the boots, gins, or any other torments, to urge them to declare the truth.' In a letter, preserved in the Record Office at London, Sir Francis Walsingham writes to the English ambassador at Edinburgh in 1583, that Queen Elizabeth desires that Father William Holt, an English Jesuit then in Scotland, may be 'put to the boots.' The boot was subject of allusion on the English stage in 1604; in Marston's *Malcontent*, printed in that year, one of the characters is made to say: 'All your empirics could never do the like cure upon the gout the rack did in England, or your Scotch boots.' A servant girl gave evidence under the torture in the Flen-draught case in 1632, and several others were ordered to be put to the torture. It was revived after the insurrection of the west-land Covenanters in 1666, and continued to be used throughout the reigns of Charles II., and James II., and during the first years of William III. The Claim of Right brought forward by the Scottish Convention in 1689, denounced 'the use of torture, without evidence, and in ordinary crimes, as contrary to law.' Notwithstanding, Neville Payne, an English gentleman who was supposed to have entered Scotland on a treason-able mission, was in 1690 put to the torture under a warrant subscribed by King William, and still shown in the Register House at Edinburgh. The boot was applied to one leg, the thumb-screws to both hands, but without any effect, although, in the words of one of the Privy-councillors, the torture, which lasted for two hours, was inflicted 'with all the severity that was consistent with humanity, even unto that pitch that we could not preserve life and have gone further.' This is believed to be the last time that the boot was used. But it was not until 1709, when Scotland had ceased to be an independent kingdom, that the British parlia-ment enacted that in future 'no person accused of any crime in Scotland shall be subject or liable to any torture.' Torture is believed not to have been used in England after 1640. An instrument similar to that known in Scotland was in use in Germany under the name of 'Spanish Boots.' And in some collections there are shown iron boots which were heated to an unbearable degree on the foot of the victim (see TORTURE). For the boot in France, see *Fountain-hall's Diary* (1900), and Bingham's *Bastille* (1888).

Bootan. See BHUTAN.

Boötes, in Greek Mythology, the son of Demeter and Iasion, who, being plundered of all his possessions by his brother, invented the plough, and cultivated the soil. He was translated to heaven with the plough and yoke of oxen, under the name of Boötes ('ox-driver'), which is still borne by a constellation beside the Great Bear (or

Wain). According to others, Boötes was the son of Lycaon and Callisto (see URSA MAJOR). The bright star *Arcturus* is in Boötes.

Booth (from a Scandinavian word, seen in Danish *boð*, Icelandic *búa*, 'to dwell,' and perhaps in German *bude*), a covered stall or hut at a market or fair, from which goods are sold, still much used in the east of Europe and in Asia, and in England at Weyhill Fair, near Andover. As towns sprang up, the yearly fair was more or less supplanted by the weekly market. The slight booth which was set up in the same spot every week, had an irresistible tendency to become substantial and permanent; and the records of the twelfth and some following centuries are full of unavailing complaints against the encroachments which were in this way made upon the market-places and streets. Thus, Joceline of Brakelond chronicles the ineffectual efforts of his great and wealthy abbey, in 1192, to dislodge the burgesses of Bury St Edmunds from the shops, sheds, and stalls which they had erected on the market-place without leave of the monks. Stow relates that the houses in Old Fish Street, in London, 'were at the first but movable boards set out on market-days to show their fish there to be sold; but procuring license to set up sheds, they grew to shops, and by little and little, to tall houses.' The same chronicler tells us that 'in Cheapside, from the great conduit west, were many fair and large houses, which houses in former times were but sheds or shops, with solars (i.e. lofts or upper chambers) over them.' So in Edinburgh the range called at first 'the Boothraw,' and afterwards 'the Lucken-booths,' arose in the very centre of the High Street. The trader who for years had spread his stall under the shelter of the same buttress of the church or town-hall, began to rest a fixed wooden booth against it, gradually transforming the timber beams into lath and plaster, or even into brick or stone, until at length the basement of the stately cathedral or *hôtel de ville* was incrustated all over with unseemly little booths (or *krames*, as they were called in Scotland), like limpets on a rock. The booth which thus arose had often but one apartment, opening on the street by a narrow door, and a broad unglazed window, closed at night by a wooden shutter, dividing in the middle, and hinged at top and bottom, so that the upper half formed a sort of awning, while the lower half served as a table for the display of the trader's wares. It was at this window that business was conducted, the trader standing within, the buyer without. Traces of the middle-age booth still remain in this country, and in France there are many perfect examples, some believed to be of the 12th century.

Booth, BARTON, a celebrated 18th-century actor, born in 1681, the son of a Lancashire squire, nearly related to the Earl of Warrington. He received a good education at Westminster, and was just about to be sent to Cambridge when he chose a career for himself by becoming an actor. He first offered his services without success to Better-ton, then played for two seasons at Dublin. A fresh application to Betterton was more successful, and in 1700 he appeared as Maximus in *Valen-tinian*, in Lincoln's Inn Fields, London, and was soon a favourite. His performance of Cato in Addison's tragedy in 1713 brought him wealth as well as fame. Other great Shakespearean parts were Henry VIII., Othello, Brutus, and Hotspur, and Lothario in Rowe's *Fair Penitent*. He died 10th May 1733.

Booth, CHARLES (1840-1916), born at Liver-pool, was by 1862 partner in a Liverpool firm trading to Brazil. He earned gratitude by the

laborious researches he organised and digested into *The Life and Labour of the People of London*, a report published in 17 volumes between 1889 and 1903, and designed primarily to show 'a numerical relation which poverty, misery, and depravity bear to regular earnings and comparative comfort; the religious influences fill an important volume in a work which required the services of many enumerators. Booth published besides a volume on *The Aged Poor in England and Wales* in 1894, and works on old age pensions (1891, 1899). He was a commissioner on tariff reform (1904), and a Privy-councillor. See *Life* by his wife (1918).

Booth, JUNIUS BRUTUS (1796-1852), the son of a London lawyer, went on the stage at seventeen, and became famous as Richard III. at Covent Garden. In 1821 he migrated to the United States, where, after thirty years of successful work, he died suddenly on board a Mississippi river steamer. He had long been subject to a natural eccentricity, which, at times, when aggravated by domestic affliction or habits of intemperance, developed into temporary insanity. —His son, **EDWIN THOMAS BOOTH**, American actor, was born in Harford county, Maryland, November 13, 1833. When sixteen years of age, he made his first appearance on the stage, in the part of Tresselt, his father acting as Richard III. Two years later he himself successfully assumed the part of Richard in place of his father, who unexpectedly refused to fulfil an evening's engagement. The following year the two went to California, where the son remained for several years, visiting Australia meanwhile. Meeting with little pecuniary success, in 1856 he returned to the Atlantic states, and from that time thenceforward was recognised as a leading member of his profession. He visited England (1861-62), and in 1864 produced *Hamlet* at New York for 100 nights consecutively. In 1869 he opened a splendid theatre in New York, whose building cost over a million dollars, but which involved him in pecuniary ruin. He revisited California in 1876, and in the spring of 1877 was able to settle with his creditors, having earned during the season over £120,000. Booth visited Great Britain and Germany in 1880-82, and was everywhere received with enthusiasm. He died at New York, 7th June 1893. See his *Life and Art* by William Winter (1894). —**JOHN WILKES BOOTH**, another son of Junius Brutus Booth, was born at Baltimore in 1839, and was an unsuccessful actor. In 1865 he entered a conspiracy to avenge the defeat of the Confederates, and shot President Lincoln (q.v.). He broke his own leg, but managed to escape to Virginia and conceal himself till 26th April, when he was tracked, and, refusing to surrender, was shot.

Booth, REV. WILLIAM (1829-1912), founder and 'general' of the Salvation Army (q.v.), was born at Nottingham, was educated there, and from 1850 to 1861 acted as minister of the Methodist New Connection. From the first he was zealous in holding evangelistic services, but the new departure which led to the creation of the Salvation Army on military lines began in 1865 with mission work among the lower classes in the East End of London. Since 1878 Booth's movement has been known as the Salvation Army, of which he continued to be the mainspring and controlling power, directing its movements at home and abroad from his headquarters in London. His enthusiasm and wonderful organising power gave life to the religious military system, of which he was really 'general.' He wrote *Darkest England and the Way Out* (1890). See *Lives* by G. S. Railton (1912) and Begbie (1920). His wife (1829-90) was fully associated with him in the movement and the publications dealing with it. See the *Life* of Mrs Booth by

Booth-Tucker (1892), and the works quoted at SALVATION ARMY

Boothia Felix, a peninsula on the north coast of North America, in which is the most northern part of the continent, Murchison Point, 73° 54' N. lat. It is joined to the mainland by Boothia Isthmus, is bounded on the N. by Bellot Strait, and to the E. is separated from Cockburn Island by Boothia Gulf, a southward continuation of Prince Regent's Inlet. It was discovered by Sir John Ross (1829-33), and named after his liberal friend Sir Felix Booth (1775-1850), a London distiller, who had furnished £17,000 for the expedition. Here, on the western coast, near Cape Adelaide, Ross discovered the magnetic pole, 70° 5' 17" N. lat., and 96° 46' 45" W. long.

Bootle-cum-Linacre, a parliamentary and county borough adjoining Liverpool, with a municipal technical college, and a great part of the Mersey dock system; pop. (1861) 6500; (1881) 27,112; (1891) 49,217; (1921) 76,508.

Booton, or **BUTUNG**, an island of the Malay Archipelago, separated by a narrow strait from the south-eastern ray of Celebes, and from the island of Muna. Area, 1700 miles. It is high, but not mountainous, and thickly wooded, produces fine timber, rice, maize, sago, &c. The people are Malays. The sultan, who resides at Bolio, is in allegiance to the Dutch, an under-resident being stationed on the island. Pop. 17,000.

Boots and Shoes. The foot-coverings of the human family are exceedingly varied in form, and they are not less diverse in the material out of which they are made. These differences are not merely due to the caprices of fashion and the influence of traditional costume and habit, but they owe their existence in large measure to the conditions of climate, and to the necessities of the daily life and occupations of their wearers. It must be at once obvious that the foot-coverings which would be sufficient and healthy amid tropical sands, would be most unsuitable for withstanding the rigours of a Greenland winter. The lightest sandal, which simply defends the sole of the foot, is appropriate for the one condition, while the other demands the closest, most warm, and water-tight covering which can be devised. The elementary foot-covering is the sandal, which consists only of a pad or sole shaped to the sole of the foot, and held on by straps or thongs. From the sandal grows up the slipper, in which straps and lacing are dispensed with, and a sufficient 'upper' of leather or other soft material is provided to keep the article on the foot. The ordinary short shoe is the next development, it being laced, buttoned, or otherwise fastened on the foot; and in the boot the upper is continued so as to embrace more or less of the leg.

The sandal is the most ancient foot-covering of which we have any record, and examples of very ancient manufacture, taken from Egyptian mummies, are preserved in public collections. The shoe frequently referred to in the Old Testament, and which played an important part in buying and selling, and in other social usages, was a sandal.

Fig. 1.

Fig. 2.

The common sandal of the ancient Egyptians (fig. 1) consisted of stripes of papyrus plaited into a kind of mat, and that form remains the type of sandal

of plaited grass or straw worn to this day by multitudes in Central Asia, India, China, and Japan. The sandal was the ordinary shoe of the ancient Greeks, an ornamental example of which is shown in fig. 2. In Greece, shoes were used only in exceptional circumstances, and long boots lacing up the front were worn by hunters. Sandals (*solee*) were the everyday wear of the Roman populace; the patricians wore shoes (*calcei*) of black leather; red leather shoes were reserved for senators; and the long boot or 'buskin' (*cothurnus*), reaching sometimes to near the knee, and frequently supplied with a thick sole to add to the apparent stature of its wearer, was appropriated to tragedians and hunters. Sandals and slippers continue to this day to be the staple foot-gear of oriental communities, and great wealth of ornamentation—inlaying of wood in sandals, and elaborate embroidery in gold and coloured silks, with fantastic curling of the toes—are characteristics of the richer productions of the eastern tradesmen.

In medieval times, shoes with long pointed toes were worn by the high-born; and towards the end of the 14th century these points became ridiculously elongated, so that there appeared to be a long strap projecting from each foot. Different kinds of half-boots were worn by the Anglo-Saxons and Anglo-Normans; and in the reign of Edward IV. the boot proper, with tops and spurs, was established as an article of knightly dress. In the reign of Charles I. the jack-boot, as it is called, became indispensable in the costume of cavalry soldiers and horsemen generally. Fig. 3 is a representation of this highly characteristic boot, which we readily associate with the civil and foreign wars that distracted the 17th century. This huge species of boot remained in use in British cavalry regiments until comparatively recent times. The jack-boot is almost entitled to be called the parent of the top and some other varieties. Boots with

Fig. 3.
Jack-boot.

tops of a yellow colour were so commonly worn by gentlemen in the 18th century as to become a peculiarity in the national costume of the English. Among jockeys and fox-hunters top-boots are likely to remain in permanent use. What perhaps contributed to break up their general use was the introduction of the Hessian boot as an article of walking-dress. Worn over tight pantaloons, the Hessian boot was a handsome piece of attire, giving, undoubtedly, an elegant appearance to the nether costume. A representation of a Hessian boot, with its tassel, is seen in fig. 4. Boots of this shape were worn by English general officers in the early part of the French war and somewhat later. At length they were superseded by the well-known Wellington boot, which, as its name imports, was introduced by the great Duke, as a simplification, under the loose military trouser. The Wellington was almost entirely abandoned in England in consequence of the universal use of short ankle-boots. It is still largely used in some continental countries and in the United States.

Fig. 4.
Hessian Boot.

Wooden shoes (*sabots*) are a feature of continental life, and are worn in certain industries in the United Kingdom.

The making of overshoes of india-rubber is a large factory industry, especially in the United States, where the use of 'gum' shoes, as they are called, is almost universal. Factory shoes with soles of

gutta-percha also came into use about the middle of the 19th century. The tendency of the material to soften and spread with heat was a serious disadvantage, partly overcome in balata soles, in which the material is covered with canvas.

The shoemaking industry of the United Kingdom, which has to do principally with boots and shoes made of leather, is divided into two departments—one the old handicraft, the other a factory industry. For many reasons the ancient domestic craft of shoemaking is dying out. Machinery and appliances for every operation are being gradually perfected, and although no machine work can equal in combined solidity and elasticity the productions of a first-class craftsman, superior operatives are comparatively scarce, and the products of the factory are at least even in quality, and much cheaper than hand-made boots and shoes.

Shoemaking as a handicraft is a sedentary and contemplative industry. The foot to be fitted being duly measured, the upper leathers are cut out and sewed together, an operation called 'closing.' The 'stuff' for the soles is then cut out of tanned ox-hide, the pieces being the insole, the outsole, and the lifts of the heel. These are steeped in water; a last or foot-model suitable for the boot or shoe to be made is chosen, and to the bottom of it the insole leather is nailed; and then by pulling and hammering it is moulded accurately to follow the contour of the last-sole. The edges of the insole are then pared and rounded down; the upper is drawn tightly down over the last, and its lower edge is nailed temporarily over the edge of the insole. A narrow strip of leather, the welt, sufficient to run round the whole sole excepting the heel part, is then selected, and the three edges, sole, upper, and welt, are by an inseaming stitch sewed together. The welt then forms a band to which the outsole is sewed around the edges. The heel lifts are built up, and sewed and nailed together; and thereafter the finishing operations include the burnishing of the sole and edges, the insertion of eyelets or buttons in the uppers, &c.

The shoe-trade as a factory industry only grew with the development of the sewing-machine, and now, except for repairing, there is scarcely such a thing as hand-sewing in the uppers of shoes. The great difficulty which, apart from hand-sewing, at first lay in the way of applying machinery to shoemaking was in the fastening together of the sole and the uppers. Early in the 19th century one Randolph, and a little later, the celebrated engineer, Sir M. I. Brunel, patented methods of fastening together soles and uppers by means of metal pins and rivets. The upper leather was drawn well over the insole, the outer sole was then applied, and the whole pinned together and riveted by the point of the pins coming against, and being turned by an iron-shod last inside. The germs of the modern sewing-machine were embodied in a patent secured in 1790 by Thomas Sant, the object of his invention being to sew boots and shoes; but the sewing-machine was not applied to boot-making till after its success in ordinary stitching was demonstrated. A machine for sewing together soles and uppers was patented in America by Blake, and as subsequently improved by Mackay, it became the apparatus which, for the period during which the patents were current, dominated the factory shoemaking industry. The Blake-Mackay machine sewed through outsole, upper, and insole at one operation; but as the corporation owning the machine held the patent right for machine-sewed boots and shoes, improvements by outsiders were for the time barred. Now there are in operation many varieties of sewing-machines, some of which sew welted boots in all respects like the hand-made product.

Factory-made boots and shoes are now entirely cut out by machinery; the uppers are sewn by strong sewing-machines, and soles and uppers are fastened together either by (1) sewing, (2) pegging with wooden pegs, (3) riveting with metal pins, or (4) screwing by means of the Standard screw machine. The latter most ingenious apparatus uncoils a reel of screwed brass wire, inserts it into the sole, and cuts off the wire flush with the outsole with remarkable rapidity.

Booty is the victors' share in property captured from the vanquished. In the British army all booty belongs to the sovereign, and is distributed as his advisers may direct. Most regiments have amongst their treasures articles of the nature of booty or 'loot'—plate, bric-à-brac, heathen deities, &c. Booty on a large scale may be sold and the value apportioned. The authorised sacking of the Chinese Summer Palace in 1860 was a notable instance of looting. Booty is not recognised officially in the army of the United States. The loot seized (both by soldiers and civilians) at the siege of Peking in connection with the Boxer rising in 1900 was for the most part restored to the Chinese government. Prize or prize-money is the word used in the British navy; see **PRIZE**.

Boporo, an inland native town of Liberia, 80 m. N. by E. of Monrovia.

Bopp, **FRANZ**, the distinguished philologist, was born at Mainz, 14th September 1791. By the lectures of Windischmann, he was led to devote himself to the study of oriental languages, a study which he continued with Chézy, De Sacy, and A. W. Schlegel at Paris. Here he composed his first work on *The Conjugation of the Sanskrit Verb* (1816), in which he scientifically demonstrated the original community of the Indo-European languages. He next removed to London, aided by a small pension from the King of Bavaria, where he published an improved edition of his previous work, and at the same time edited several episodes from the Mahābhārata. He returned to Germany in 1821, and some years after received the appointment of professor of Oriental Languages at Berlin, where he remained till his death, which took place 23d October 1867.

During these years he published his great work, *A Comparative Grammar of Sanskrit, Zend, Greek, Latin, Lithuanian, Old Slavonic, Gothic, and German* (1833-52); in a new edition he added Old Armenian. A final edition was published after his death (1871). It was translated into English by Eastwick (3d ed. 1862). In this work he elaborated his theory of the origin of grammatical inflection. According to this all the words of the Indo-European languages are derived from *monosyllabic* roots which are of two kinds, *verbal* and *pronominal*, and by the addition of one or several of such roots to another root, grammatical inflection is produced. Bopp further held that this stage of language, which has been called the *agglutinative*, was prior to the separation of the Indo-European languages, and that their succeeding history was one of phonetic decay, not of growth. It is in the treatment of this part of the history of language that Bopp is at his weakest. He allowed himself great latitude in dealing with phonetic laws, and finally showed he had no true method at all when he made the unfortunate attempt to connect the Malay-Polynesian languages (1841) with the Indo-European.

Besides the works mentioned above, Bopp wrote monographs on the Celtic, Caucasian, Old Prussian, and Albanian languages, as well as a Sanskrit grammar and glossary. See *Life* by Lefmann (1892-97).

Boppard, a town of Rheinland, on the left bank of the Rhine, 10 miles S. of Coblenz. The

Baudobriga of the Romans, it was afterwards an imperial city till 1312, and the seat of a diet in 1234. Pop. 6000.

Bora, a strong, cold, and dry, north-east wind, which often rages with great severity in the Upper Adriatic, especially in winter, sometimes for eight or nine days together. Diez explains the word as a Milanese form of Italian *borea*, 'north wind,' from Lat. *boreas*; others identify it with an Illyrian *bura*, 'storm,' of Slavonic origin.

Bora, **KATHARINA VON**, the wife of Luther, was born of an old family in the district of Meissen, 29th January 1499. At a very early age she entered the Cistercian convent of Nimptschen, near Grimma. Becoming acquainted with Luther's doctrines, she found herself very unhappy in her monastic life; and finally, along with eight other nuns, whose relatives, like her own, refused to listen to them, she applied for assistance to Luther. Luther obtained the services of Leonhard Koppe, a citizen of Torgau, and by him and a few associates the nine nuns were liberated from the convent in April 1523. They were brought to Wittenberg, and Katharina became an inmate in the house of the burgomaster Reichenbach. Luther, through a friend, Amsdorf, offered her the hand of Dr Kaspar Glaz. She declined this proposal, but declared herself ready to marry Amsdorf, or Luther himself. Her marriage with Luther took place on 13th June 1525. She bore her husband three sons and three daughters, and is best described in Luther's own words as 'a pious, faithful wife, on whom a husband's heart could rely.' She died 20th December 1552 at Torgau. See *lives* of her by Stein (3d ed. 1886) and Thoma (1900), and the *lives* of Luther (q.v.).

Boracic Acid, or **BORIC ACID**, is found native (1) in the steam or vapour which rises from certain volcanic rocks in Tuscany, (2) as the mineral *Sassolite*, occurring largely in California, and (3) as a saline incrustation in the crater of a mountain in the island of Volcano, in the Lipari group, 12 miles N. of Sicily. Boracic acid also occurs in combination in *Borax* (q.v.), *Datolite* (q.v.), *Boracite* (q.v.), *ulexite*, *colemanite*, and other minerals, and to a very minute extent in trap rocks generally. The plan of collection pursued in Tuscany is to form a series of caldrons—100 to 1000 feet in diameter, and 7 to 20 feet deep—partly by excavation, and partly by building, in the side of the volcanic mountain where the steam and boracic acid vapours are issuing from fissures, and divert the course of a mountain stream, so that at pleasure the caldrons or *lagoons* may be supplied with water. As the volcanic vapours gurgle through the water contained in the lagoons, the boracic acid is arrested by the water, which becomes impregnated with it. The liquid is passed from one lagoon to another, then on to settling-vats and flat-bottomed evaporating pans, till it becomes so concentrated that on cooling, impure crystals of boracic acid separate. In this condition it is exported.

Much boracic acid has been found in California in *ulexite*, a native borate of lime and soda, and in *colemanite*, a native borate of lime. The latter yields the largest amount of boracic acid obtained on the Pacific coast. Native boracic acid is employed as a source of *Borax* (q.v.), and contains about three-fourths of its weight of true boracic acid, accompanied by one-fourth of water and impurities. In a pure condition boracic acid may be prepared by dissolving forty parts of borax, $\text{Na}_2\text{B}_4\text{O}_7$, in one hundred of water, and acting thereon by twenty-five parts of hydrochloric acid, HCl , which removes the soda, forming chloride of sodium, NaCl , and water, H_2O , and on cooling the mixture, the boracic acid, HBO_3 , crystallises out.

On re-solution in water and re-crystallisation, it is obtained in pure white feathery crystals. These crystals have the composition of $\text{HBO}_2 \cdot \text{H}_2\text{O}$, and on heating lose the whole of the water they contain, yielding boracic anhydride, B_2O_3 , thus:

Boracic acid is one of the 'weak' acids; i.e. in solution it is very slightly ionised. Boracic acid is used in the arts as a flux, and as an ingredient in the glaze employed in pottery; and the wicks of stearine and composite candles are treated with it, so that when the candle is burning, the end of the wick, when it gets long, may fuse and fall to the side, where it can be burned away. As an antiseptic and preservative of food, boracic acid is extensively employed, either alone or along with borax. An ointment, called 'Lister's Ointment,' of great antiseptic power, is prepared from boracic acid, wax, and paraffin. In the preservation of butter, milk, wine, beer, meat, and fish, it is probably used to a greater extent than any other antiseptic. There have been many experiments made in order to ascertain whether borax and boracic acid are injurious to the health. Elaborate tests were gone through by Dr Wiley on many individuals in the United States. Dr Wiley proved that when continuously taken as a preservative in food, they undoubtedly disturbed the digestive system. On the other hand, some observers favour the view that little or no harm results to the health from continuous consumption in small quantity. Boracic acid is volatile when its solution in water or alcohol is evaporated, and when alcohol containing it is ignited, the flame has a green colour characteristic of boracic acid.

Boracite, a mineral consisting of magnesium borate and chloride ($\text{Mg}_2\text{B}_4\text{Cl}_2\text{O}_{30}$). When heated it becomes positively electrified on four cube-corners, negatively on the other four. Its crystals, apparently of the cubic system, are really birefringent, and built up of a number of individuals. At a temperature of 265° they suddenly become isotropic, and lose their pyroelectric quality.

Borage, *Borago* or *Borago*, a genus of Boraginaceæ (q.v.), of which the three species are

Common Borage (*Borago officinalis*):
a, a flower.

all natives of the countries around the 'Mediterranean. The Common Borage (*Borago officinalis*) is

found in waste places in many parts of Europe, and is pretty frequent—no doubt naturalised—in Britain. It is a herb of somewhat stout and coarse appearance, but is easily recognised by its scorpioid cymes of few large ($\frac{2}{3}$ inch) beautiful blue flowers with purple-black anthers, spurred at the back. Borage was formerly much cultivated and highly esteemed, being reckoned amongst the *cordial* flowers, and supposed to possess exhilarating qualities, for which it no longer receives credit. The belief in its virtues was at one time extremely prevalent in England, its very name being, according to some, a corruption of *corage*, and its use correspondingly universal. The flowers were put into salads, Gerard tells us (1597), 'to make the mind glad;' and he adds: 'There be also many things made of them, used everywhere for the comfort of the heart, for the driving away of sorrow, and increasing the joy of the mind.' It was also frequently put in wine, and although it has no sensible properties, its traditional virtues still retain for its leaves a place in the preparation of claret-cup. The young leaves and tender tops are pickled, and occasionally boiled for the table, and are still used in salads in Germany.

Boraginææ, or BORAGINACEÆ, a chiefly herbaceous order of sympetalous dicotyledons, the alternate exstipulate leaves generally rough with hairs which proceed from a thick hard base (whence the old name *Asperifoliæ*), and the whole plant mucilaginous and emollient. The inflorescence is usually a scorpioid cyme; the calyx and corolla 5-lobed regular; the stamens epipetalous and alternate; and the primitively 2-lobed ovary in the Boraginoideæ becomes early divided into four 1-seeded nutlets, much resembling those of Labiata (q.v.), and with a single gynobasic style. The other groups (Cordioidæ, Ehretioideæ, Heliotropioideæ) differ from the Boraginoideæ chiefly in the fruit, which in the more typical species is a succulent drupe, or in the Heliotropes consists of four dry achenia more or less consolidated; and in having a terminal style.—There are about 1200 known species. The Boraginoideæ are natives principally of temperate climates, the others mainly tropical. Borage (q.v.), Alkanet (q.v.), Comfrey (q.v.), and Forget-me-not (q.v.) are examples of the Boraginoideæ; Heliotrope (q.v.) of the Heliotropioideæ. The colour-changes of the flowers are interesting.

Borås, a Swedish town, on the Wiske, 36 miles E. of Gothenburg; it dates from the days of Gustavus Adolphus, but has of late rapidly grown by reason of its large cotton-mills; pop. 28,000.

Borassus. See PALM.

Borax, or BIBORATE OF SODA, is found native as a saline incrustation on the shores of certain lakes in Persia, Tibet, Nevada, and California, but it also occurs widely scattered over the world. It has been long known, but it was not till 1732 that its chemical nature was ascertained. At first, and till comparatively recent years, the main source was the crude article brought from Tibet in skins, and going by the name of *tinca*. As so obtained, the crystals were coated with a greasy matter, said to be derived from the skins, and this had to be first removed by means of soda before the borax could be refined. In 1856 the Californian sources of borax were discovered, the bottom of a lake being found to be covered to a depth of about 18 inches with a mud impregnated with borax, and containing large crystals of it. From this mud, by treatment with hot water and crystallisation, there is first obtained *concentrated* borax, and by further treatment thus yields the *refined* borax. In other places in California the borax is found mixed with sand in a light granular form, containing

about $\frac{1}{3}$ th of the pure salt, while large crystalline masses of it occur below the surface of the ground. In all these cases a similar method of purification is adopted. The most important deposits now worked in California are the 'colemanite' (calcium borate) in the Mojave Desert. The colemanite is readily dissolved by sodium carbonate solution, when the borax crystallises out. To reduce the amount of transportation, the Pacific coast borax is made of high quality, one pound being equal to three pounds of ordinary borax. In Europe large quantities of *artificial* borax are prepared from the Boracic Acid (q.v.) of Tuscany. This, mixed with carbonate of soda, is heated in a furnace, carbonic acid being liberated, and the crude salt is then dissolved in water to free it from impurities, and crystallised. The changes which take place in this operation are represented by the following equation :

The common variety of borax contains ten equivalents of water (water of crystallisation), $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$, and forms prismatic crystals; but another variety exists, known as *octahedral* borax, and containing only five molecules of water. Borax is soluble in twelve times its weight of cold water, and in half its weight of boiling water, yielding a clear solution with a slightly sweetish taste. It is of great use in the chemical arts owing to its properties of dissolving metallic oxides, and of forming a flux when heated with other substances. On this account it is much used in connection with the Blowpipe (q.v.), before which it yields different coloured 'glasses' corresponding to the metals present. It is also employed in the manufacture of enamel, and for glazing or coating vessels in pottery, as also in the formation of the paste for artificial gems. To the metallurgist it is an aid in the readiness with which it promotes the fusion of metallic mixtures, and the separation of the metals; and to the solderer it is of service in forming a thin glassy coating over the edges of the metals, which prevents their oxidation at the time they are being joined together. It is used as a mordant in calico-printing; while as an adjunct to, or substitute for, soap in washing, it gives satisfactory results in the proportion of $\frac{1}{4}$ lb. to 10 gallons of water. For the toilet, borax in solution is invaluable, making in itself an admirable shampoo, while its utility for cleaning brush and comb is well known. A varnish prepared by boiling together one part of borax and five of shellac with water is used for stiffening hats; and as an insecticide it is very powerful, being specially destructive to cockroaches. For preserving meat, fish, butter, and milk, either alone, or along with Boracic Acid (q.v.), borax has a wide application. Besides these technical uses, borax is much used in medicine as an antiseptic, being applied either in powder or as lotion. For ulcerating surfaces, and in the treatment of the infantile disease thrush, it is extensively applied; while throat lozenges, designed to relieve the hoarseness of public speakers, generally contain this valuable salt as a constituent.

Borda, JEAN CHARLES DE, mathematician and astronomer, was born in 1733 at Dax, in the French department of Landes. As early as 1756 his *Mémoire sur les Projectiles* procured him admission to the Academy of Sciences. Entering the navy, he busied himself with nautical, astronomical, and hydraulic investigations, and suggested great improvements in the form of vessels. In 1777-78 he did good service in the American war; in 1782

he was captured by the English on the voyage home from Martinique, but was permitted to return on parole to France, where he entered the ministry of marine. He died at Paris, 20th February 1799. He was a leading member of the commission entrusted with the measurement of a meridian arc; and he rendered essential service to the new system of weights and measures.

Borde. See BOORDE.

Bordeaux, a great seaport of France, and the chief town in the department of Gironde, is beautifully situated in a plain on the left bank of the Garonne, about 60 miles from its mouth in the Atlantic, and 359 miles SSW. of Paris by rail. Transatlantic steamers can easily ascend with the flood to Bordeaux. The commerce both by the Garonne and by railways is very extensive, and its long and crescent-shaped harbour has a singularly noble appearance. But the quay accommodation is limited; most of the ships have to anchor in the stream, exposed to very high and swift tides. In 1867-79 a spacious dock was constructed at the lower or northern end of the town, with a depth at ebb-tide of 22 feet, and an area of almost 25 acres; and in 1888 the construction of stone embankments, iron jetties, and other improvements was commenced. Port extensions were begun in 1907. In 1913 a new dock of 15 acres' water area was opened on the left bank. Other improvements are the deepening of the river, and extension of existing quays and docks. The river is crossed by a noble bridge of 17 arches and 532 yards in length, erected in 1811-21. The old Canal du Midi connects Bordeaux with the Mediterranean. The old town has narrow crooked streets; but the newer parts of the city and the suburbs have wide streets, fine squares, and pleasant promenades lined with trees. In spite of damp winters and oppressive summers, and an imperfect drainage system, Bordeaux is a healthy town. The cathedral of St André, which was consecrated in 1096, is remarkable for its beautiful towers, designed and built, it is said, by English architects during the English occupation. Ste Croix dates from the 10th century, and St Seurin is also very ancient. Several handsome large churches have been built since 1868. Bordeaux is the seat of an archbishop, and of a university with faculties of science, letters, medicine, and law; of schools of theology, art, and navigation, an academy of arts and sciences, a valuable gallery of paintings, a museum, and an observatory. The Grand Théâtre is one of the largest and finest buildings of its kind in France. Pop. (1872) 190,682; (1901) 257,471; (1911) 261,678; (1921) 267,409.

The principal industries are connected with the wine trade, the making of brandy, liqueurs, vinegar, sugar, tobacco, printed calicoes, woollen goods, casks, paper, earthenware, glass bottles, capsules, labels, and chemical products. Wine, brandy, vinegar, fruit, fish, lace, jewellery, ready-made clothing, and skins are among its principal exports, the largest trade being with England and South America. Bordeaux is an important centre of the French cod-fishing ships for Newfoundland, Iceland, and elsewhere.

Except those of Champagne, no French wines have been so much exported to foreign countries as those grown in the department of Gironde, especially the Médoc, and known as Bordeaux wines. Some of them are red (known in England as *Claret*), others white. The finest red wines are produced by the vineyards of Château-Lafite, Château-Margaux, Château-Latour (all Médoc wines), and Haut-Brion, the best from the Graves district; St Julien and St Estéphe are of the

second rank; the St Emilion wines are a distinct group. Of the white wines, the Château d'Yquem is the finest of *Sauternes*, others being Bommes, Barsac, Piegnae. Graves is a commercial name for the sweeter white wines of the left bank of the Gironde. During the struggles with the phylloxera, oidium, and mildew (the latter combated successfully with 'Bordeaux mixture' or solution of copper sulphate and lime), large quantities of wine were imported from Spain and Sicily.

Burdigala was the capital of the *Bituriges Vivisci*, and being made by Hadrian the capital of Aquitania Secunda, it became both the principal emporium of the south-west of Gaul and the seat of its best educational institutions. The so-called palace of Gallienus is the ruin of a Roman amphitheatre. The town shared the fate of Aquitania, and suffered successively from Vandals, Goths, Franks, and Moors. It was taken by Charles Martel in 735, but was again spoiled by Norman plunderers in the 9th century. It became the capital of the Duchy of Guienne, and in 1152 passed, by the marriage of Eleanor of Guienne with Henry of Normandy (afterwards Henry II. of England), under the dominion of England. Edward the Black Prince for a considerable time held his splendid court in Bordeaux, but it was restored to France in 1451. It was the seat of the Collège de Guyenne. During the Revolution it was the principal strength of the Girondists, and suffered fearfully at the hands of the Terrorists. Its inhabitants were the first to declare for the Bourbons in 1814. During the Franco-Prussian war, the first sittings of the National Assembly in 1871 were held here; and it was the seat of the French government during part of the Great European War. Bordeaux was the birthplace of Richard II. of England, the poet Ausonius, and Rosa Bonheur.

Bordeaux, HENRY, French novelist and Academician (1919), born at Thonon (Haute Savoie) in 1870, studied law before writing *La Peur de Vivre* (1902), *Le Lac Noir* (1904), *Les Roquevillard* (1906), &c.

Bordelais, the country round about Bordeaux, was a division of Guienne.

Borden, SIR ROBERT LAIRD, G.C.M.G. (1914), born at Grand Pré in 1854, became a barrister and K.C., practising in the Nova Scotian courts and the Supreme Court of Canada. He entered parliamentary life (for Halifax) in 1896, and in 1901 was chosen leader of the Conservative party in the Canadian House of Commons. When Laurier's government sought commercial reciprocity with the United States in 1911, it was routed, and Borden became the head of a Conservative ministry. He organised Canada for war, and was the first overseas premier to attend a cabinet meeting in London. His Coalition ('Union') government, formed in 1917, was sustained by a general election. He retired in ill-health in 1920.

Bordentown, a city of New Jersey, on the Delaware, 6 m. SE. of Trenton, has iron-foundries, machine-shops, shipyards, and worsted mills; pop. 4400.

Borders, the tract of country lying immediately on both sides of the frontier line between England and Scotland, which runs north-east and south-west, between the head of the Solway Firth and a point a little north of the mouth of the Tweed, the counties touching upon this line being Cumberland and Northumberland on the English side, and Dumfries, Roxburgh, and Berwick on the Scottish side. The distance between the two extremities is nearly 70 miles as the crow flies; but, following the frontier line in its irregularities, about 110 miles.

The line of division is for the most part a natural one. The middle portion, extending 35 miles, is formed by the high barrier of the Cheviot range, the watershed of which may be regarded as in general the line of division. Leaving the Cheviots in the south-west, the line descends for nearly 22 miles by the Keishope Burn, and the waters of the Liddel, the Esk, and the Sark, to the Solway Firth. From the north-east extremity of the Cheviots, the windings of the Tweed, for about 13 miles eastward, form the natural boundary. But at a point about 5 miles from the mouth of that river the line strikes out semicircularly in a north-easterly direction, till it reaches the east coast a few miles north of the town of Berwick-on-Tweed, the space thus enclosed, embracing within it what are known as the 'Liberties' of that town, having been at one time regarded as neutral territory between the two kingdoms. On the western Border, near the Solway, was a corresponding tract of country claimed by both kingdoms, and hence called the 'Debateable Land.'

While the above may be taken roughly as defining the Border in the geographical sense, the word has for *historical* purposes a wider signification, especially on the Scottish side. In old Scots acts of parliament applying to the Border district, and in general in Scottish history, the counties of Selkirk and Peebles, though they nowhere touch the frontier line, are embraced within the term. While, therefore, the southern limit of the English Border may be defined by a line drawn from Carlisle to Newcastle, following nearly the route of the Roman Wall, the Scottish Border may for historical purposes be described as a truncated or rounded triangle, its base-line extending from Wigtown Bay on the west to the mouth of the Tweed on the east, the apex reaching the town of Peebles, nearly 40 miles from the Cheviots.

There is yet a third and more popular sense in which the word Border is used, here again affecting the Scottish side. This, which may be called the *literary* sense of the term, arises out of the extraordinary prominence which has been given to the vale of the Tweed, including its tributaries the Yarrow, the Ettrick, and the Teviot, by the splendid romances and poems of Sir Walter Scott, by the poetry of Leyden and the Ettrick Shepherd, by the ancient and traditional ballads relating to the district, and by the pathetic songs and legends more immediately connected with the Yarrow, and glorified by the genius of Wordsworth. While, indeed, all these three senses of the word—the geographical, the historical, and the literary—fall to be recognised in any formal treatise on the subject, it must be admitted that in ordinary usage the third or literary sense predominates. Hence, when Border tales or Border ballads or Border traditions are spoken of, it is the Scottish rather than the English side of the frontier that is referred to.

Although the name of the Border, or Borders, is not perhaps older than the 13th century, it is of interest to note that from the very dawn of British history the district so called has exhibited in its annals the characteristics of a frontier or borderland, in so far as it has almost constantly formed the boundary or point of contact between contending races and nations. It is first made known to us by Tacitus as *pars* of the kingdom of Brigantia, or the territory of the Brigantes—probably a Welsh-speaking race of Celts—who ruled all the country between the Humber and Mersey as far north as the Firth of Forth. They were a strong, courageous, and warlike people, able for many years to keep the Roman cohorts at bay, and thus to serve as a check upon the northward progress of the invaders. The great earthwork which runs almost parallel with the

Roman Wall between Carlisle and Newcastle may have been erected, not by the invaders, as hitherto supposed, but by these native tribes, as a barrier against the advance of the Romans. It faces south, and is therefore presumed to have been built as a defence against the south. If so, we have here a defined frontier line as far back as the 1st century of the *era*. The district immediately to the north of this line and the Solway Firth was subsequently, however, conquered by Agricola, and held by the Romans until their departure, though not without many insurrections on the part of the natives. The district then became the common battle-ground successively of Picts and Britons and Angles, until the 6th century, when we again find it appearing in history under the name of Bernicia, and occupied (as it has been ever since) by an English-speaking people. Bernicia, in the succeeding century, was conjoined with Deira to form the great kingdom of Northumbria, which kingdom, as Brigantia had done, included all the territory between the Humber and the Forth. From the 7th to the 11th century what we now call the Border district still continued to be the meeting-point of hostile races, the Scots of Dalriada and the Picts, and latterly the Scots alone, contending, now with the Angles, and now with the usurping Danes, for the possession of the country watered by the Tweed. At length, in 1018, the Scots, under Malcolm II., defeated the Angles of Northumbria in a great battle at Carham, near Coldstream, whereupon the Northumbrians ceded to the Scots the district then known as Lothian (*q.v.*), that is, the whole of the territory between the Tweed and the Forth. The Scots afterwards obtained possession also of Cumberland, but this was wrested from them by William Rufus in 1092. The Tweed, however, still remained as the boundary between England and Scotland on the eastern Border, until the frontier was finally adjusted, much as it exists, by a commission of both countries in 1222.

From the time of the rise of the Celtic dynasty of Scottish kings in the person of Malcolm II. a change for good is observable in the condition of the Scottish Border. Under his descendant, Malcolm Canmore, the aristocracy was strengthened by the settlement of noble Saxons and Normans; and by David I. were planted the great religious houses of Kelso, Melrose, Jedburgh, and Dryburgh, which could not fail to have a civilising and ameliorating effect upon the people and the country. On the English side the church had a less vigorous growth, having no such munificent patron as King David, yet there also it could boast of the fine cathedral of Carlisle, the Premonstratensian abbey of Alnwick, the ancient monastery and priory of Hexham, and the still more ancient and classic shrine of Lindisfarne or the Holy Island. The Scottish side of the Border made, moreover, at this time a great advance as compared with the English side. This advance was due not a little to its physical superiority. Northumberland, which marches with Scotland for fifty miles, and almost of itself constitutes the English Border, was mostly, with the exception of the south-eastern portion, a barren and bleak country. Even now, its western and northerly parts, with their high and uncongenial exposure, are little better than moorlands. The soil, being cold and wet and sour, is unfavourable to plant-life, and for miles on miles, in some places, scarcely a tree visible. On the other hand, the Scottish Border, with its broad and fertile valleys fed by numerous streams, its valuable woodlands, and its green hill-pastures, was extremely favourable, notwithstanding its exposure to hostile inroads, for the settlement and support of a numerous and thriving population. Hence Berwick and Jedburgh and Roxburgh rose in the 13th century into towns of great wealth and im-

portance, having an extensive home and foreign trade, Berwick being described as the greatest seaport in the British island. But with the death of Alexander III., and the outbreak of the War of Succession, all this was changed. Berwick was captured by the English king and sacked; the castles of Jedburgh and Roxburgh were from time to time taken and retaken, being alternately garrisoned and demolished. Of the ancient busy trading town of Roxburgh, not one stone is left upon another; and of its great castle and fortress, but the merest vestiges. Even the splendid religious establishments—the abbeys, churches, and monasteries—did not escape spoliation and destruction, Melrose requiring, after the time of Edward I., to be almost rebuilt. On the English Border, the ruinous effects of these national wars were felt also, though not to the same extent; for in Northumberland was no town to speak of nearer than Newcastle, and the intervening moors and mosses afforded but scant booty to the spoiler. The Scots, therefore, in their reprisals, while not omitting to ravage the nearer dales of the Rede and the Till, were obliged to extend their inroads beyond the high and barren tracts of Northumberland; and it was the richer though more distant valleys of Durham and Yorkshire that heard the fierce war-cry of Randolph and the Douglas, and yielded to the invaders the harvest of the sword. Weardale and Teesdale were better hunting-grounds in which to 'drive a prey,' than the upper waters of the Coquet and the Tyne.

It was doubtless due to the exigencies occasioned by these constantly recurring Border wars and raids, from the 13th to the 16th century, that the whole country on both sides of the frontier became so thickly studded with castles and peel-towers, the numerous ruins of which still form a distinctive feature in Border scenery. These castles and towers, generally planted on heights overlooking the river-valleys, stood as a rule within sight one of another, in order that the signals of invasion or alarm might be the more rapidly spread from point to point. From a survey made in 1460, we find that Northumberland alone possessed thirty-seven castles and seventy-eight towers; and the Scottish side was equally well strengthened and defended. Among the larger and more important fortresses on the English side, were the castles of Wark, Norham, Alnwick, Newcastle, Carlisle, Naworth, and Cockermouth; and on the Scottish side, the castles of Berwick, Roxburgh, Jedburgh, Ferniehirst, Cessford, Branksholme, Hermitage, Lochmaben, Caerlaverock, and Threave; besides the hundreds of peel-towers and bastle-houses scattered over the country. On both Borders also grew up many fortified towns, upon whose walls the citizens by turns kept nightly watch and ward.

To narrate all the invasions that took place on either side of the Border would be to repeat great part of the general history of England and Scotland; but as giving some idea of the extraordinary havoc and destruction occasioned by these wars and invasions, two authentic reports may be referred to. In 1544 Sir Ralph Evers and Sir Brian Latoun, with an English army, invaded the Scottish Border, and between July and November they destroyed 192 towns, towers, barmkyns, parish churches, &c.; slew 403 Scots and took 816 prisoners; carried off 10,386 head of cattle, 12,492 sheep, 1296 horses, 200 goats, and 850 bolls of corn, besides an untold quantity of 'inside gear and plenishing.' In one village alone—that of Lessudden (now St Boswells)—Sir Ralph Evers writes that he burned '16 strong bastle-houses.' Again, in September of the following year, the Earl of Hertford a second time invaded the country, and between the 8th and 23d of that month, he 'razed

and cast down' the abbeys of Jedburgh, Kelso, Dryburgh, and Melrose, and burned the town of Kelso. At the same time he destroyed about 30 towns, towers, and villages on the Tweed, 36 on the Teviot, 12 on Rule Water, 13 on the Jed, 45 on the Kale, 19 on the Bowmont, 109 in the parishes of Eccles and Duns in Berwickshire, with 20 other towers and villages in the same county. The places destroyed are all named in the report to the English king, along with a classified list of that terrible sixteen days' destruction, embracing 7 monasteries and friars' houses, 16 castles, towers, and peels, 5 market-towns, the immense number of 243 villages, with 13 mills, and 3 'spitals and hospitals.'

The Borders have likewise been the scene of some great historical battles. Of what may be called national contests, in which Scots and English armies were opposed to each other, there is the battle of Halidon Hill (1333), Otterburn (1388), Homildon Hill (1402), Piperden (1435), Flodden (1513), Solway Moss (1542), and Ancrum Moor (1544). In three of these battles—Otterburn, Piperden, and Ancrum Moor—the Scots were victorious. Of what may be called internal contests, we have the fight at Arkinholm, now Langholm (1455), between Scotsmen, when James II. broke the power of the Douglasses; the battles of Hedgeley Moor, near Percy's Cross, and of the Levels, near Hexham (1463), between the English adherents of Lancaster and York, when the Lancastrians were defeated; the skirmish of Haliden, near Melrose (1525), between Scotsmen under Angus and Buccleuch, when Angus vanquished the Border chief; and the battle of Philiphaugh (1645), when Leslie drove Montrose off the field. Of many faction fights and deeds of daring, such as the Raid of the Reidswire (1575) and the rescue of Kinmont Willie from Carlisle Castle (1596), the ancient ballad-writers are the best historians.

In order to provide against the exceptional tendencies of the Borderers on the one side of the frontier to fall out with and plunder those on the other side, the governments of both countries, in the 14th century, divided the frontier into the East, West, and Middle Marches, over each of which divisions wardens were appointed by their respective sovereigns. These wardens were salaried officials, and endowed with great administrative and judicial powers. They stood to their respective districts in the place of the sovereign; and the office was at one time hereditary, being practically vested as the prerogative of a few of the higher nobles who had estates on the Borders. At certain times, a day of truce was held, when the English and Scottish wardens met, examined each other's credentials, and settled any questions that might be in dispute between their followers. As in the case of the Raid of the Reidswire, these meetings did not always end peacefully. (For details as to the duties of the wardens, and the laws and usages of the warden courts, see *The History of Liddesdale and the Debateable Land*, by R. B. Armstrong, part i. 1883.) One district which was the cause of much trouble to the wardens of the West March, was that known as the Debateable Land, which lay partly in England and partly in Scotland. Its south boundary was formed by the Esk, from its junction with the Liddel to where it enters the Solway; and within the Debateable Land were comprehended the baronies of Kirkcandrews and Morton in Cumberland, and Bretallach or Bryntallone (now Canonbie) in Dumfriesshire. It is first mentioned in a proclamation of 15th November 1449, as 'the lands called Batable or Threep lands.' Its chief families were the Armstrongs and Grahams, both clans being noted as desperate thieves and freebooters.

They had frequently to be dealt with by force of arms, till in the 17th century the Grahams were transported to Ireland, and forbidden to return upon pain of death. Other districts of the Borders from time to time called forth hostile visitations from the Scottish kings or their commissioners, when great numbers of the robbers were frequently seized and hanged. So late as 1606, the Earl of Dunbar executed as many as 140 of them. The union of the crowns removed some obvious grounds of contention between the English and Scottish people, and after the middle of the 17th century the Borders gradually subsided into a more peaceful condition.

The character and habits of the Borderers were much alike both on the English and the Scottish side. While the greater nobles lived in large and strong castles, the inferior gentry occupied the peel-towers, in which the accommodation might barely suffice for the wants of a small farmer of the present day. And yet the accommodation, meagre as our modern ideas would esteem it, was probably sufficient for the simple wants of a rude and hardy people, who must have set but little value upon movable and perishable property, knowing how liable they were to have it stolen or consumed, and how readily, by equally predatory means, they might replace it from the stores of others. The tie or feudal bond, on the Scottish Border at least, between the chiefs and the principal men of their clans, what that implied in the term 'kindly tenant'—i.e. a tenant who was of the kin of the chieftain, or whose family had held their lands in succession, from father to son, for several generations. This tie was not dependent upon payment of rent either in money or in kind, but upon kinship, and was for the binding together of the leading members of the clan in the common objects of self-interest and self-defence. In a society so constituted it was inevitable that there should be much strife and contention, not only between the residents on opposite frontiers, but among the clans themselves, and many instances of cruelty and almost savage vindictiveness have been left on record; yet what to some extent redeemed this state of things from sheer barbarity was the fine and elevating spirit of chivalry. Hence the achievements which have found lasting enshrinement in the Border ballads.

Border States, in America, meant historically the slave-holding states bordering on the southern

free States—Delaware, Maryland, Virginia, Kentucky, and Missouri; but North Carolina, Tennessee, and Arkansas were sometimes included in the designation. Of these Virginia, North Carolina, Tennessee, and Arkansas seceded to the confederacy. The 'Border war' in Kansas between the pro-slavery 'sons of the south' (also uncomplimentarily called 'Border ruffians'), from Missouri and elsewhere, and the 'Free State men' from the north, began in 1854, and continued for several years; as is explained at KANSAS.

Border-warrant, an obsolete form of diligence used in the Border counties of Scotland for detaining the person of an English debtor. It was more rigorous than the general *medietatio fugæ* warrant. See DEBT.

Bordighera, a winter-resort in the Riviera, north Italy, on a hill overlooking the Mediterranean, 7 miles WSW. of San Remo by rail. It was founded in 1470, but its modern progress dates from the opening of the Cornice road in 1823, and of railway communication. The place, which is noted for its palm gardens, suffered severely from the earthquake of 1887. Resident population, 5000. See the *Westminster Review*, vol. cliv. (1900).

Bordone, PARIS, a painter of the Venetian school, was born of noble parentage at Treviso in 1500. He studied under Titian, to whom his works are often attributed, and under Giorgione. He worked in his native town, in Vicenza, and in Venice. In 1538 he was invited to Fiance by Francis I., who employed him to paint portraits of himself and of leading members of his court. He was knighted by Francis II. At Augsburg he painted in the Fugger Palace, and at Milan in the chapel of St Jerome; and he died at Venice in 1570. His most important monumental work in painting was the six sacred subjects with which he decorated the dome of San Vincenzo, Treviso; and his 'Fisherman presenting the Ring of St Mark to the Doge,' now in the Academy, Venice, is ranked as masterpiece among his easel pictures. See Kugler's *Schools of Painting in Italy* (1881) and the new edition of Crowe and Cavalcaselle.

Bordure, a border surrounding a shield, generally said to occupy one-fifth of the field. Sometimes an independent bearing, it is often a difference of a cadet. It may be engrailed, invected, wavy, &c., parted in many ways, or charged. A *bordure compony* or *gobonated*—i.e. divided into sixteen squares—is often an indication of illegitimacy; and in later times a *bordure wavy* has been used in England (not Scotland) with the same significance. See HERALDRY.

Bore, a tidal phenomenon at the estuaries of certain rivers, also called *Eagre*. The first name may be derived from the Old Norse *bára*, a wave; the second, obviously the same as William of Malmesbury's *higre*, is erroneously referred to *ægir*, a sea-god. When a river expands gradually towards a very wide mouth, and is subject to high tides, the spring flood-tide drives an immense volume of water from the sea into the river; the water accumulates in the estuary more rapidly than it can flow up into the river; and thus there is gradually formed a kind of watery ridge stretching across the estuary, and rushing up towards the river with great violence and much noise. In some cases this ridge or bore is many feet in height. This phenomenon is observable in several British rivers, as the Severn, Trent, Wye, and Solway. The most celebrated bores are those of the Ganges, Brahmaputra, and Indus: in the Hugli branch of the Ganges the bore travels 70 miles in four hours, and often appears suddenly as a liquid wall over 7 feet high. That at Hang-chow-fu is very dangerous; and the Bay of Fundy is remarkable for

its tidal phenomena. See TIDE; and for a detailed description of the phenomenon with illustrations, see F. M. Burton's *The Shaping of Lindsey by the Trent* (1907).

Bore is the internal cavity of any kind of firearm. It is in most cases cylindrical; but in the Lancaster gun it was oval, and in the Whitworth hexagonal, both being also spiral; while in all rifled firearms it is furrowed with spiral grooves, and for the same reason—viz. to give that rotation which enables an elongated projectile to be used (see RIFLE). In most modern guns and small arms there is a chamber at the bottom of the bore. In breech-loading weapons this chamber is larger in diameter than the bore, in order that the cartridge and projectile may enter it easily. In muzzle-loaders it is generally of smaller diameter, but an enlarged chamber has been tried in some heavy guns in order to give more air-space for the expansion of the gases when the cartridge is fired. The diameter of the bore is called the 'calibre.' In rifled guns it is measured not from the bottom of the grooves, but from the smooth surfaces between them, called the 'lands.' Heavy iron guns were formerly cast solid and then bored out, but, as it is essential that the surface of the bore should be extremely hard to prevent its being 'scored' by the shot, endeavours were made in America to attain this object by casting them hollow, and cooling the inner surface more rapidly than the rest of the metal. But see CANNON.

Boreas, the Greek name of the north-east wind, blowing towards Hellas from the Thracian mountains, and personified in mythology as the son of Astræus and of Eos or Aurora, and as brother of Notus, Zephyrus, and Hesperus. He was said to dwell in a cave of the Thracian Hæmus. He had a temple in Athens, because he destroyed the Persian fleet of Xerxes; and at Megalopolis a yearly festival was celebrated in honour of his aid against the Spartans.

Borecole. See GREENS, SEA-KALE.

Bore-holes in the crust of the earth are made for purposes of Blasting (q.v.) and Mining (q.v.); for obtaining water, salt, petroleum, or natural gas; for gaining information useful to the geologist or the engineer as to the nature and condition of rocks below the surface. They are used also as sources of power, as in Italy, where they discharge high-pressure steam, utilised by turbines. Since 1904 Sir Charles Parsons has advocated the sinking of a shaft to 12 miles in a region to be selected by geologists. He estimated that it might be completed in about eighty-five years, at a cost of £5,000,000. Of existing bores, that of Paruschowitz (6572 feet), once the deepest, has been surpassed by Czuchow (7350 feet), also in Silesia. For methods, see BORING.

Borelli, GIOVANNI ALFONSO, a distinguished mathematician and astronomer, and the founder of the iatro-mathematical school, born at Naples 28th January 1608, was educated at Florence, and became professor of Mathematics at Pisa, and of Medicine at Florence. Having taken part in a revolt, he was obliged to leave Messina, and spent the remainder of his life at Rome, where he died 31st December 1679. He carefully observed the motions of the satellites of Jupiter, then little known, and was one of the first to recognise the parabolic paths of comets. He wrote a treatise on fevers, and a number of works on subjects of applied mathematics, of which the most celebrated is that *De Motu Animalium* (Rome, 1680–81). In this work he applies the laws of mechanics to the motions of animals.

Borers, a name applicable to many beetle-like or Coleopterous insects in the family of wood-eaters

or *Xylophaga*, but peculiarly applicable to the genera *Ptinus* and *Anobium*. The larvæ eat their way through wood, and when that happens to be furniture, the species of *Ptinus*, &c. come to have some practical human interest. They are mostly inconspicuous animals, resting during the day in the larval tunnels, active and roving at night. *Ptinus* is common all the world over, and both as adult and larva much too common in the experience of herbarium keepers, insect collectors, owners of stuffed birds, not to mention wearers of furs, and housewives generally. They are most readily got rid of by the lure of a damp cloth or by vegetable matter left in the room over night, and destroyed with its attracted victims in the morning. The larva of *Anobium striatum* does great damage to furniture made of soft wood. Its little round tunnels, looking as if made by a drill, and full of the finest powder formed from the devoured wood, are familiar enough.

Borer (*Anobium striatum*):
Natural size, and magnified.

The larva rests after a while, spins a silken cocoon, sleeps and grows for a time at the bottom of its hole, and finally emerges a miniature beetle, a dark-brown insect, with a proportionately large thorax overlapping the head, but not measuring in all much above a line in length. Like its relatives in this family, it pertinaciously feigns death when touched or alarmed, an instinct probably at first due to a pathological panic and paralysis, but now normal, habitual, and doubtless of advantage. Other species (*A. tessellatum* and *A. pertinax*), also found in furniture, but likewise, as is indeed usual, on trees, have in their adult stage some importance in the history of superstition as insects which produce a knocking noise, regarded as a presage of the approach of death. The adult is wont to knock against the wood with his upper jaws, but these 'blows, which are taken for the knocking of Death himself, are nothing but a knocking of the male at the door of his loved mate.' The larvæ should be smothered. There are many other genera of borers, *Lymerylon navale* on ship-timber, *Ptilinus* on books, *Apate* on oak furniture, and so on; but the point of interest is the general habit of the family. See DEATH-WATCH, also BORING-ANIMALS.

Borgerhout, a suburb of Antwerp, on the Schyn, with manufactures of tapestry and tobacco, and dye and bleaching works, and a monument of Carnot, who defended it. Pop. 55,000.

Borghese, a family of great distinction in the republic of Siena, and afterwards at Rome. One of the family, CAMILLO BORGHESI, ascended the papal throne in 1605 as Paul V., and by him other members of the family were advanced to high positions. A marriage with the heiress of the house of Aldobrandini brought the Borghese family into the possession of great wealth.—CAMILLO FILIPPO LUDOVICO BORGHESI, Prince Borghese, born at Rome in 1775, joined the French army, and in 1803 married Pauline, the sister of Napoleon Bonaparte, and widow of General Leclerc. Under the French empire he was for some time governor-general of the provinces beyond the Alps, and held his court at Turin. He sold the Borghese collection of artistic treasures to Napoleon for 13,000,000 francs, receiving in part-payment the Piedmontese national domains; but

when these were reclaimed by the king of Sardinia in 1815, he received back some of the works of ancient art. After the overthrow of Napoleon he separated from his wife, and broke off all connection with the Bonaparte family. He lost Guastalla, which he had received through his wife, but retained the principalities of Sulmona and Rossano, his hereditary possessions. He died in 1832.—The Borghese Palace, bought by the Italian government in 1902, is one of the most magnificent at Rome, and its collection of paintings is remarkably fine.

Borghesi, BARTOLOMMEO, COUNT, a distinguished Italian antiquary, born at Savignano, in 1781. At Bologna and Rome he devoted himself to archaeological researches. He next arranged and catalogued various collections of coins, including that of the Vatican. In 1821 he fixed his residence in the little republic of San Marino, where he lived devoted entirely to study, and died 16th April 1860. Borghesi did enormous service to Roman epigraphy and numismatics. See his complete works, published at the expense of the French government by the Academy of Inscriptions at Paris (vols. i.-ix. 1862-79).

Borgia, a family originally of Jativa, in the Spanish province of Valencia, where, at the time of the expulsion of the Moors (1238), the name figures among the *Caballeros de la Conquista*. One of its members, Alfonso de Borja (1378-1458), bishop, and private secretary to Alfonso of Aragon, accompanied that monarch to Naples, where he had gone to establish his rule. This Borja, chosen pope as Calixtus III., settled a number of his family in Italy. Rodrigo de Borja (1431-1503), his nephew, in turn ascended the papal throne in 1492, under the title of Alexander VI. (q.v.); and from that time the principal seat of the family was in Italy, while its name took the Italian form of Borgia. Before his elevation to the pontificate Alexander had had a number of children by a Roman girl, known in history as Vanozza, but whose real name was Giovanna Catanei (1442-1518). Two of these children, Cæsar, the fourth, and Lucrezia, Duchess of Ferrara, the fifth, were destined to play important parts, and to acquire in history an unhappy renown.—CÆSAR BORGIA was born in April 1476, and died in 1507. An ambition that knew no bounds, energy that never flagged, and a contempt for laws divine and human, joined to qualities of the first order as a general and administrator, rendered him one of the most extraordinary figures of the Renaissance period. To arrest his vast projects, there was required a league of all Italy and of the most powerful sovereigns of Europe. Vowed to the priesthood from his birth, and from the age of seventeen invested with the dignity of cardinal, he early resolved to surmount all obstacles to his ambition; he shrank from neither sacrilege nor murder to gain his end. He succeeded his elder brother, Giovanni, Duke of Gandia, who had been murdered, in the post of *gonfaloniere*, or captain-general of the Church, for which he readily doffed the purple to assume the breastplate. His father, Alexander, had made an alliance with Louis XII. of France for the invasion of the kingdom of Naples. In the Princess Charlotte d'Albret, sister of the king of Navarre, a bride had been found for Cæsar, who, named Duke of Valentinois, with a rich pension and the promise of a company of two hundred lances for the support of the throne of St Peter, went to contract his marriage (11th May 1499) in France, and carried in exchange to Louis the papal bull, which was indispensable to the king before he could espouse his predecessor's widow, Anne of Brittany. Cæsar's active life extended over no more than four years. Whilst his father

was crushing the feudal power of the barons of the Romagna, he undertook to recover, one by one, all the fiefs along the Adriatic coast which had ceased to acknowledge the over-lordship of the Holy See. In two successive campaigns, he made himself master of the Romagna, Perugia, Siena, Piombino, the duchy of Urbino; he went so far as to threaten Florence itself, and was planning the reconstruction of a kingdom of Central Italy, with himself at its head, when a powerful league was formed against him. His own officers sought to arrest his march, but he misled them by a feint, divided them, invited them to Sinigallia, and there coldly passed on them sentence of death. Named Duke of Romagna by the pope, he was proceeding to menace Bologna and expel the family of Bentivoglio, when, on the eve of his departure for his third campaign, both he and his father were stricken with sudden illness while at a farewell banquet given by the Cardinal of Corneto. There was talk of poison. The old man succumbed (August 18, 1503), but Cæsar's youth, and his extraordinary force of will, triumphed over the malady; the death of Alexander, however, was in effect the end of his projects, and his enemies now raised their heads. The election of Pius III. (a Piccolomini) gave him a moment's hope; the succession of Julius II. (Della Rovere), his bitterest enemy, after Pius's brief reign of twenty-seven days, was fatal to him. Cæsar surrendered at Naples, under the promise of a safe conduct from the king of Aragon; but Gonsalvo de Cordova broke his oath, and (25th May 1504) had him arrested and carried to Valencia. After an attempt to break out of Chinchilla, where he was first imprisoned, he was removed to Medina del Campo, from whence, on the 25th October 1506, he made his escape to the court of Navarre. Here he took command of the royal forces against Luis de Beaumont, Constable of Navarre, who refused to surrender the citadel of Viana, which he held for the king; and in a sortie, 12th May 1507, at the age of thirty, Cæsar Borgia fell, after heroically defending himself, at a place called Mendavia. Despite attempts to rehabilitate it, his memory remains in execration—despite, too, the estimate of Machiavelli, who had him in view when he wrote the *Prince*; he has moreover left among the peoples whom he governed, the reputation of a just prince, upright and severe, and of an able administrator. He encouraged art, and was the friend of Pinturicchio, and the protector of Leonardo da Vinci.—**LUCREZIA BORGIA**, born at Rome in 1480, married in the first instance Giovanni Sforza, Lord of Pesaro (June 1493); but her father, ambitious of a more advantageous alliance, annulled this marriage (20th December 1497), and gave her (20th June 1498) to Alfonso, Duke of Bisceglia, nephew of the king of Naples. The same motive induced her father and brother to separate her from her new husband, who was assassinated, 18th August 1500, by Michelotto, Cæsar Borgia's bravo. For the third time free, the pope's daughter became, in spite of the repugnance of the Duke Ercole d'Este, the wife of the latter's son, Alfonso, who soon after inherited the duchy of Ferrara. Lucrezia has been represented as placed outside the pale of humanity by her wantonness, her vices, and her crimes; but the recent researches of most accurate and unprejudiced historians have demonstrated that in her youth, with no initiative, no choice permitted to her, she was rather the too pliant instrument in the hands of Alexander and of Cæsar Borgia. She died 24th June 1519, enjoying the respect of her subjects, a generous patroness of learning and of art.

See **POPE**, and **Crichton** and **Pastor** on the popes; and books by A. H. Mathew (1912), Leslie Garner (1912), Woodward (1913), Sabatini (1914); on Lucrezia, works

by Gilbert (1869), Yriarte (1888), and Gregorovius (trans. 1904).

Borgo, a name given to a number of towns and villages in Italy, indicating growth around a castle or castellated rock, the original Borgo (a word of Germanic origin; see **BOROUGH**). Thus there are the *Borgo*, the north part of Rome, on the right bank of the Tiber; *Borgo-Manero*, 20 miles NNW. of Novara; *Borgo San Donnino*, in the province of Parma, &c.

Borgognone, **AMBROGIO**, a Milanese painter, whose real name was Ambrogio Stefani de Fossano. The assertion that he designed the façade of the Certosa of Pavia in 1473 is very doubtful; but he is known to have been working upon frescoes there in 1480, and the series, in which he was aided by his brother, Bernardino, is so extensive that it must have occupied many years. He returned to Milan in 1494; painted the tribune of the Incoronata, Lodi, 1497; and in 1508 produced an altarpiece, still in San Spirito, Bergamo. His latest undoubted work was a 'Coronation of the Virgin,' in San Simpliciano, Milan, 1524. His devotional subjects are characterised by a gentleness and a measured calm; but in treating dramatic incident he is frequently forced and exaggerated.

Borgu, or **BUSSANGA**, an African state, of which the eastern part falls within Nigeria, the western part being in Dahomey, lies to the west of the Niger (q.v.), and borders on Gando and Illorin, provinces of Sokoto (q.v.). The country is very fertile and thickly populated. It was at Boussa (or Bussang) on the Niger, one of the chief towns, that Mungo Park lost his life in 1805; Nikki, to the west, is in French territory.

Boric Acid. See **BORACIC ACID**.

Boring is variously performed according to the medium dealt with. For making small holes in soft woods and like substances, awls are employed, which merely cut and displace a portion of the yielding material. In boring hard woods and large holes, carpenters use gimlets, augers, and the brace and bits, which all cut and scoop out the material. In the jewelry and small metal industries, hand-drills, which consist of a spindle with steel bits, to which reciprocating rotation is given, are the implements for piercing small holes. The boring of holes in metal plates is effected by means of *drills* driven by machinery. The annexed figure shows the essential parts of such a boring machine. The drill is inserted in the end of a vertical spindle, P, which revolves in a fixed frame, and is driven by the bevel-wheels, G. The metal to be bored is placed on a table or other support below the drill; and the up-and-down motion, or end-pressure and off-action, of the drill is effected by the hand-gear, O, N, turning the screw, M; which being coupled to the top of the spindle at L, presses it down or raises it, according to the way it is turned. The spindle slides vertically in the collar forming the axis of the bevel-wheel, but is carried round with it by means of the pin, I, which projects into a groove seen at J.

The boring of cannon and of cylinders for steam-engines, and for the propeller shafts of

Boring Machine.

steamers, is most conveniently dealt with under BORE and CANNON; see also TURNING.

As applied to the earth and to rocks, boring embraces two classes of operations—boring of shot-holes for Blasting (q.v.), and the sinking of bores in prospecting for minerals, and in forming wells for water, salt-brine, and mineral oils. Blast-holes in rocks are made from 1 to 2—sometimes more—inches in diameter, and may pierce to the depth of 9 feet. Such holes are most simply made in hard rock by a steel-pointed drill, struck by a hammer, and turned partly round after each blow to make the hole cylindrical. The addition of a little water serves to preserve the temper of the boring tool, and makes the rock more easy to cut. In soft rock, whenever the hole is to be vertical, a 'jumper' is used. This is a weighted drill, which acts merely by its own weight when let fall from about a foot in height. The powdered stone is removed at intervals by a 'scraper.' But in all great engineering undertakings rock-boring machinery now supplants hand work. The machines are principally devised to imitate the percussive action of the hand-drill, the boring chisel being worked and rotated by compressed air, and sometimes directly by steam. The compressed-air machines possess the great advantage of aiding in the ventilation of the working—often a most important consideration, seeing the operations are chiefly carried on in confined spaces where vast volumes of poisonous gases are evolved from explosions. The earliest practical rock-boring machine was that of Sommeiller, one of the engineers of Mont Cenis Tunnel, at which undertaking the apparatus was first used. Now the forms of percussion machines are very numerous, improvements being directed towards lightness and simplicity of parts, and to the method—automatic or otherwise—of advancing the boring tool as the work proceeds. Well-known machines are the

Darlington Rock-boring Machine.

Barrow, Burleigh, Darlington, Ferroux, Ingersoll, Champion, and McKean rock-borers. Diamond-drills working in the manner described below are also used. Brandt's rotatory borer is an apparatus similar in action to the diamond-drill, but with a crown of hardened steel in place of cutting diamonds. The tool is pressed against, and rotated by water-power. An apparatus similar in principle to the brace and bits of the carpenter is used with advantage in uniform rock such as slate.

The bores for deep wells of all kinds, and for discovering the mineral contents of a region, come under one category. As a preliminary operation in mining, boring is of the utmost importance for discovering the position, thickness, and dip of mineral strata or lodes, and for ascertaining the nature of the overlying deposits. Bores are made by three

classes of implement—(1) boring-rods, (2) rope-borers, and (3) diamond-drills.

The rod boring instrument consists of an iron shank, having a cross-bar at the top and a hollow screw at the bottom; to this all the successive boring instruments are fastened. A simple chisel is first attached to the screw, and one or two men press upon the cross-bar, and at the same time force it round like an auger; while another workman, by means of a lever erected overhead, with a chain descending from it to the cross-bar, gives an up-and-down motion to the instrument. When the chisel becomes clogged, from the accumulation of material which it has loosened, it is exchanged for a cylindrical auger, provided with a valve, which scoops out the separated material; and thus by alternate chopping and scooping the work is carried on. The nature of the strata is determined with considerable facility and certainty by examining the fragments brought up by the auger. As the work advances, successive lengths of rod are screwed on at the upper end. A derrick pole is erected over the bore-hole for the purpose of elevating the rods, to permit the change of the tools.

The rope method of boring has been long in use among the Chinese. By it the great loss of time, arising from the screwing and unscrewing the rods, at each elevation of the chisel or auger, is saved. The chisel and scooping instrument are fastened to a rope, which is alternately elevated and allowed to descend by the simple force of gravity; the instrument thus forces its way through the ground. In the softer rocks of the newer formations this method has been successfully employed in boring for artesian wells. The rope-boring machinery of Mather and Platt of Salford, in which a flat hempen rope is employed, is in extensive use.

For deep well-sinking, as in the Pennsylvanian oil region where depths of 3000 feet and more have to be reached, and for mineral prospecting, the diamond-drill in modern times largely superseded all other borers. With this apparatus the earth can be pierced at any angle, which is a great advantage in investigating mineral deposits; and moreover, the drill produces solid and continuous cores of the strata through which it passes, so that a complete section of any bore can be exposed to view. The diamond-drill consists of a 'crown,' or cylinder of steel, around one edge of which are fixed a series of black diamonds. These diamonds are so set that they project alternately a little beyond the outside and inside edge of the cylinder. This crown is screwed to lengths of iron tubing as it cuts its way by rotation into the rock, and it makes as it descends an annular cutting somewhat bigger than the thickness of the continuous tube, which the crown and its shaft form. Thus a core of rock is cut out and held within the tube, and the pieces may be lifted out from time to time as the work proceeds. The detritus resulting from the abrasion of the ring of rock is continuously washed away by a current of water forced down within the tubing. Diamond-drills are made of many sizes, from $\frac{1}{4}$ up to 18 inches diameter. The prototype was M. Fauvelle's hollow boring-rod with steel crown described at the British Association meeting in 1846. See BORE-HOLES, MINING.

Boring-animals. While individual boring-animals are noticed under many separate articles (e.g. BARK-BEETLE, BEE, BIVALVES, BORERS, CATERPILLAR, TEREDO, &c.), it may be convenient to indicate the widespread nature of the habit. Every one is familiar with the appearance of an oyster-shell on the shore riddled with small holes. This is the work of a small sponge, *Cliona* or *Vicia*, one of which inhabits each hole. Other *Clonids* exhibit a similar power, but how the

boring is effected is not known. The action is probably both chemical by means of secretion, and mechanical by means of spicules. Many worms not only bore in the sand and soil, but into soft organisms like sponges, or among corals and the like. Some sea-urchins, being well equipped with a protruding masticatory apparatus, seem to bore or at least to improve holes for themselves. The Crustaceans can hardly be said to bore, though they burrow very considerably, as in the case of the common crayfish. One of the Isopods, however, *Lumnoria terebrans*, devours the wood of harbour piles and the like, and does no little damage to such structures on northern coasts. Many insects are consummate borers both in their adult and in their larval stages. The work of the Bark-beetles (q.v.) and Bores (q.v.), and of the Carpenter Bee (q.v.), are good illustrations of this activity. The name bore-fly is sometimes applied to the large genus of Dipterous insects (*Trypeta*) whose larvæ do great damage to many plants. The most important borers, however, are the molluscs, especially such bivalves as *Pholas* (q.v.), *Xylophaga*, and *Teredo*. These belong to the large family *Pholadidae*, which includes some four-score species, all more or less efficient borers in wood or soft stone. Of these the Ship-worm, *Teredo* (q.v.), is probably the most formidable. A closely allied family of *Gastrochaenidae* is characterised by the same habit; *Gastrochaena*, *Clavagella*, and *Aspergillum* (q.v.) are the most important genera. A common bivalve on most coasts, *Saxicava*, is usually credited with considerable boring powers, but it seems probable that its activity has been overrated, and that it utilises old holes to a large extent. *Lithodomus*, belonging to the edible mussel family, is a powerful borer, and has left its marks on the well-known pillars of the Serapis temple near Naples. Many Gastropods, too, bore with their odontophores into the shells of other molluscs, into coral stocks, and the like; and any one who likes to confine snails in a paste-board box will soon have evidence of the rapidity of their boring powers. There is considerable divergence of opinion as to the exact way in which bivalve molluscs bore, but there can be little doubt that the foot rather than the shell is the chief agent.

Borissov, a town in White Russia, on the Beresina, 418 miles WSW. of Moscow by rail; pop. 20,000.

Borkum, one of the East Frisian Islands, at the mouth of the Ems, 25 miles NW. of Emden; pop. 3000, increased in the summer by over 20,000 visitors.

Borlase, WILLIAM, antiquary, was born at Pendennis, Cornwall, February 2, 1695. Educated at Tiverton and Exeter College, Oxford, he was presented in 1722 to the living of Ludgvan, near Penzance, and to the vicarage of his native parish of St Just in 1732. He devoted himself to a study of the natural history and antiquities of Cornwall, and in 1754 published his *Observations on the Antiquities of Cornwall*. His account of the Scilly Isles three years later drew from Dr Johnson the praise of being 'one of the most pleasing and elegant pieces of local inquiry that our country has produced.' His *Natural History of Cornwall* appeared in 1758. Soon after he presented his entire collections to the Ashmolean Museum. He had already been elected a Fellow of the Royal Society in 1750, and in 1766 his university gave him the diploma of Doctor of Laws. Borlase was one of Pope's correspondents, and furnished the poet with most of the curious fossils of which the Twickenham grotto was composed. He died August 31, 1772.

Bormio, an Italian town, with hot sulphur-baths, 4020 feet above the sea, in the Alpine province of Sondrio, and in the Upper Adda valley, on the road to the Stelvio pass; pop. 2000.

Born, BERTRAND DE, a famous troubadour, born about 1140 in Périgord, who played a conspicuous part in the struggles of the English king Henry II. and his sons, and died before 1215. More than forty of his poems are extant, among them both glowing love-poems and strong and sarcastic satires. See PROVENÇAL; editions by Stimming (1879) and Thomas (1881), and Hewlett's *Richard Yea-and-Nay* (1900).

Born, IGNAZ (1742-91), mineralogist, born at Karlsburg in Transylvania, was trained as a lawyer, but devoted himself to mineralogy. He wrote several works, and introduced valuable new processes in mining, bleaching, and salt-working.

Borna, a town of Saxony, on the Wyhra, 17 miles SSE. of Leipzig by rail; pop. 10,000.

Börne, LUDWIG, a noted German writer, was born 18th May 1786 at Frankfurt, where his father, Jakob Baruch, was a Jewish money-changer. He first studied medicine at Berlin under the guidance of the Jewish physician Marcus Herz, to whose wife he addressed the letters published in 1861. From 1807 he studied law and political economy at Heidelberg and Giessen, and in 1809 he returned to Frankfurt, where he was for two years (1811 to 1813) registrar of the police board. After this he devoted himself wholly to politics, and in 1818 he had himself baptised, changing his name from Lob Baruch to Ludwig Börne. In various journals started or edited by him (1812-21), he established his reputation as a vigorous opponent of the government. The French Revolution of July 1830 drew him to Paris, where he finally settled in 1832, and died of consumption 12th February 1837. His disappointment with the results of the Revolution drove him from the Liberal to the Radical camp. His views are fully developed in his *Briefe aus Paris* and *Neue Briefe aus Paris* (1832-38), which, while reproaching the German people with every kind of vice and folly, labour to incite the nation to revolution. He and Heine became bitterly hostile to each other; it was the mutual antipathy of a practical enthusiast and an æsthetic indifferentist. Börne's bright and polished style was for many years the favourite model of German journalists; his strength lay in witty satire, but the restlessness of his mind made all his work fragmentary.

The first edition of Börne's *Gesammelte Schriften* (1829-31) was followed by others more complete in 1862-63, 1868, and 1899. In 1840 his biography was published by Gutzkow, and Heine gave vent to his hatred in *Heine über Börne*. See Gervinus, *Ueber Börne's Briefe* (1838); Lives by Beermann (1841) and Holzmann (1888); and Brandes, *Das Junge Deutschland* (1899).

Borneo, next to Australia and Papua the largest island in the world, is situated in the Indian Archipelago, in 7° 3' N.—4° 10' S. lat., and 108° 53'—119° 22' E. long. It is bounded on the E. by the Sea of Celebes and the Macassar Strait, S. by the Sea of Java, W. and N. by the Gulf of Siam and the China Sea. Its length is about 800 miles, with a breadth of 700, and an area of about 284,000 sq. m. The population is roughly estimated at 2,000,000, but may be more. The coasts, which are often low and marshy, and rendered dangerous to navigation by numerous islets and rocks, present no deep indentations, though they are pierced by numerous small bays and creeks. A great part of the island must be described as mountainous; but the relations of the various ranges and groupings are still very imperfectly known, and in very few cases has the

altitude of the leading summits been accurately ascertained. In the far north rises the magnificent structure of Kinabalu (13,698 feet high), built up of porphyritic granite and igneous rocks—the culminating peak probably of the whole Indian Archipelago, and not unworthy in its picturesqueness of such a rank. Throughout the narrow northern portion of the island there runs a kind of central ridge in a general south-west direction, with highest points ranging from 4000 to 8000 feet; and this can be traced, at least as a water-parting, far to the south-west; though broadly speaking, the whole southward country is corrugated and crinkled, as it were, in a most irregular manner. This is the

result of the great process of denudation carried on by the tropical rains, which, scooping out the interior valleys and plains, have laid down the vast alluvial tracts that extend seawards into deltaic morasses. As far as is yet known, the mountain framework of the whole island consists, like Kinabalu, of eruptive and crystalline rocks of high antiquity. Of modern volcanic activity, so prevalent elsewhere in the Indian Archipelago, there is in Borneo no trace either in tradition or in the record of the rocks. A large proportion of the surface, not covered by alluvium, consists of tertiary deposits, in regard to the age of which, however, geologists are not agreed. Pages might be filled with the mere nomenclature of the rivers of Borneo; the more important may be seen on the accompanying map. Though many are powerful streams, navigable far inland for boats of considerable burden, their value as waterways is lessened by the bars which usually prevent the entrance of sea-going vessels, and in their upper reaches by frequent rapids and occasional waterfalls. In connection with the river-systems there are numerous lakes in Borneo; but of true mountain-lakes on a large scale there are probably few. The great lake of Kinabalu, which figured in older accounts with 100 miles of circumference, is a pure myth, based perhaps on a misunderstood description of the great grass-covered plain of Danao.

The climate in the low grounds is humid, hot, and unhealthy for Europeans; but in the higher parts towards the north the temperature is generally moderate, the thermometer at noon varying from 81° to 91° F. During the rainy season, from November to May, heavy storms of wind with loud thunder are experienced on the west coast. The influence of the land and sea breezes passes inland

to quite remarkable distances across the level plains and up the river-valleys. Vegetation is extremely luxuriant. The forests produce iron-wood, bilian, teak, ebony, sandal-wood, gutta-percha, dye-woods, benzoin, wax, dragon's blood, sago, various resins, vegetable oils, and gums. The camphor of Brunei is the best in Asia. The mohor tree, well adapted for making native boats, attains a height of 80, and the kaladang, suited for large masts, of 200 feet. Nutmeg, cloves, cinnamon, pepper, betel, ginger, rice, millet, sweet potatoes, yams, cotton in Amuntai, sugar-cane indigo, tobacco, coffee, pine-apples, coconuts, &c. are cultivated. The mountains and forest contain many monkeys, among which is the orang-utan. Tapirs, a small kind of tiger, small Malay bears, swine, wild oxen or banteng, and various kinds of deer abound. The elephant is only found in the north, and the rhinoceros in the north-west. The few domesticated animals are buffaloes, sheep, goats, dogs, and cats. A few horses are seen in Banjarmasin. Among the birds are eagles, vultures, Aigis-pheasants, peacocks, flamingos, pigeons, parrots, and the swifts (*Collocalia esculenta*) which construct the edible nests prized by the Chinese for making soup. The rivers, lakes, and lagoons swarm with crocodiles, and many kinds of snakes, frogs, lizards, and leeches. Fish is plentiful, and the coasts are rich in tortoises, pearl-mussels, oysters, and tiepang. Brilliant butterflies and moths are in great variety. Among the mineral products are coal, gold, and copper, especially in Montrado; antimony, iron, tin, platinum, nickel, diamonds and other precious stones, rock-crystals, porcelain-clay, petroleum, and sulphur. The diamond mines are chiefly in Landak and Pontianak (q.v.); Sambas produces the greatest quantity of gold; the kingdom of Brunei, Kutei, and Banjarmasin the largest amount of coal. The Pengaron coalfield, worked by the Dutch government, is one of the most important.

Till of late the population was comprehensively divided into three classes: Dayaks or Dyaks (q.v.), including practically all the 'aboriginal' tribes constituting the bulk of the population, especially in the interior; the 'Malays,' including the true Malays (q.v.) with all Mohammedans, whether of Javanese, Arab, or aboriginal blood; and the Chinese, engaged mainly in trading and mining. Now some authorities distinguish six (or more) distinct pagan races. Hose and MacDougall hold that (as there are no Negritos now in the island) the oldest inhabitants are Indonesians, the nomad hunters of the interior, a timid race of slight build, pale-yellow complexion, and Caucasian features. Next above these in culture are Klemantans and Kenyahs. The Kayans, comparatively late comers from the mainland of Asia, landing in South Borneo, pushed up the rivers across the central watershed, and gave the earlier tribes their culture, notably in rice-planting, iron-working, and religion. The Kayans, 'Proto-Caucasic,' may be akin to the Karens and Chins of Buima. The Mniuts and Ibans (Sea-Dayaks) are alien immigrants of much later date.

The women of Borneo, except the Dayaks, weave cotton fabrics, make earthenware, baskets, and mats of beautiful designs and colours. In the district of Banjarmasin are factories of weapons. The principal exports are gold, gold-dust, diamonds, coal, sago, pepper, jelutong, cutch, mineral oil, tallow-nuts, fish, tobacco, ratans, gutta-percha, edible nests, cotton, wax, timber, dye-woods, mats, resins, sandal-wood, camphor.

Borneo has never formed a political unity, and there is no native designation for the island as a whole. The name Borneo (Burnei or Brunei) in fact properly applies only to the Malay kingdom

on the north-west coast; and Kalaniantan or Kalamantin, sometimes quoted as a general appellation, is also of limited purport. The following are the present political divisions:

(1) *Brunei*.—This originally included nearly the whole of the north-west of the island. The sultan in 1847 undertook not to surrender any of his territory to any other power without British sanction; in 1888 it was placed under British protection; and in 1906 its administration was given to a British resident. The capital, Brunei, 20 miles from the coast, on the river of the same name, has 10,000 inhabitants. The population of the country is about 25,000. Its area (now 4000 sq. m.) was reduced by the erection of Sarawak into a practically independent principality by Sir James Brooke (1841-68), by the establishment of the British North Borneo Company as a recognised governing body, and by subsequent transference of territory to both neighbours.

(2) *Sarawak* (q.v.), since 1888 also under British protection, but only in respect of foreign affairs and the succession. Area, 42,000 sq. m.; pop. about 600,000; capital, Kuching.

(3) *North Borneo*, under the British North Borneo Company. The company's charter, granted in 1881, transferred to it rights originally obtained by an American adventurer in 1865. This territory consists partly of a portion of the old kingdom of Brunei, partly also of districts on the east coast, claimed by the sultan of the Sulu Islands. Against the British occupation of the Sulu territory a protest was made by Spain, which had for some time been gradually incorporating the sultan's possessions. As a matter of fact, the British North Borneo Company has been successful in appropriating and developing its territory, which, with an area of 31,000 sq. m., and a coast-line of 900 miles, is now divided into five residencies, subdivided into districts, and has its capital at Sandakan or Elopura, the largest settlement, with 8000 inhabitants. Jesselton, on the west coast, is the chief port. The population of the territory is about 200,000. Its political status is similar to that of Sarawak, except that a trading company takes the place of a hereditary raja.

(4) *Dutch Possessions*.—By far the largest part of the island is ruled directly or indirectly by the Dutch, who have divided it into the Residency of the Western Division of Borneo, and that of the Southern and Eastern, the former having Pontianak (q.v.) as the seat of government, the latter Banjarmasin (q.v.). Besides a number of smaller dependencies, the Western Division contains the kingdom of Landak, Tayan, Mampawa, Sukadana, Simpang, Matan, Sekadow, Sintang, Sambas. Among the separate states which go to form the Southern and Eastern Division are Kotaringin, Banjarmasin, and Martapura. Certain districts of the interior are reserved for natives only, Chinese and Malays being excluded. In some portions the administration is in the hands of Dutch resident officers, but over a large area authority is delegated to various ranks of native sultans and chiefs, with their subordinates. The area of Dutch territory has been stated at 213,000 sq. m. (56,000 in the West Division, 157,000 in the South and East Division); the population at 1,625,000 (605,000 in West, 1,020,000 in South and East).

(5) *The Island of Labuan* (q.v.), off the coast of Brunei, has belonged to the British since 1846. Attached to the Straits Settlements since 1907, it was at first included in Singapore, but has been a separate Settlement since 1912.

The Chinese had commercial dealings with Borneo as early as the 5th century, but they made no settlement for a long time after. The Malay kingdom of Borneo proper dates back to the 13th

century. Another Malay settlement of later origin, Sambas, was at first dependent on Johore (q.v.) in the Malay Peninsula. Sukadana was founded by Hindu Javanese from the kingdom of Majapahit (see JAVA), and spread its influence on the whole south part of the west coast. Mampawa was a Buginese settlement, and Pontianak was founded as late as 1771 by a colony of Arabs, Malays, and Buginese. Islam began to be preached by Arabs from Palembang in the 16th century.

The Portuguese effected a settlement in 1690 at Banjarmasin; from which they were, however, soon expelled. The Dutch succeeded in concluding a treaty of commerce with the princes of Banjarmasin. They erected a fort and factory in 1643, and a second in 1778 at Pontianak. The British made unsuccessful attempts in 1702 and 1774 to effect a settlement in Borneo, but within the 19th century acquired a preponderating influence on the north-western coast.

See Wallace, *Malay Archipelago* (1869); Posewitz, *Borneo* (trans. 1892); Ling Roth, *Natives of Sarawak and British North Borneo* (1896); Haddon, *Head-hunters* (1901); Bezemer, *Nederlandsch Oost Indië* (1905); Nieuwenhuis, *In Central Borneo* (1902) and *Over Dutch Borneo* (1904-7); Hose and MacDougall, *Pagan Tribes of Borneo* (1912); Shelford, *Naturalist in Borneo* (1917); Lumholtz, *Through Central Borneo* (1921); Rutter, *British North Borneo* (1922); Evans, *Among Primitive Peoples in Borneo* (1922), and *Studies in Religion, Folklore, and Customs in Brit. N. Borneo*, &c. (1923).

Borneo Camphor (Borneol), a variety of camphor produced in Sumatra and Borneo, is obtained from the tree *Dryobalanops camphora*, and is specially prized by the Chinese.

Borneo Tallow. See DIPTEROCARPACEÆ.

Bornholm, an island in the Baltic Sea, belonging to Denmark, about 90 miles E. of Zealand, to the SE. of the Swedish coast. Area, 226 sq. m. It is rocky, and traversed from north to south by a high mountain-ridge (511 feet), the slope of which is in great part a waste heath, but elsewhere it is not unfertile, and agriculture and cattle husbandry are successfully prosecuted. High cliffs, sand-banks, and breakers make the coast dangerous. The most notable product of the island is porcelain-clay, with freestone, limestone, blue marble, and coal. The capital of the island is Rønne or Rottum, on the western coast, a place of 10,000 inhabitants. Pop. 50,000.

Borning, or **BONING**, is a process of judging of the straightness or level of a surface or line by the eye, which looks along two or more *borning* or *boning rods* or *pieces* set up for the purpose. The term is used by masons, surveyors, and gardeners.

Bornu, a Mohammedan state of Central Sudan, bounded on the E. by Lake Tchad, and N. by the Sahara, and now mostly in Nigeria (British), but partly in the part of Cameroon under British mandate. Much of the country is perfectly level, and is liable to be overflowed in the rainy season (October to April). The heat from March to June is excessive, ranging from 104° to 107° F. The two principal rivers are the Shari and the Komaduga Yaobe, both of which fall into Lake Tchad. The soil is fertile, yields plentiful crops of maize, millet, and other tropical produce. Wild beasts are very numerous. Coats-of-mail are made both for horses and their riders. The population, which is estimated at about five millions, are mostly of negro race, and called Bornuese or Kanuri. The ruling race, called Shuwars, are of Arab descent and bigoted Mohammedans; but many traces of fetichism remain among the masses. Whatever they have of civilisation is derived from the Arabs. The shores and islands of Lake Tchad are inhabited by negro pirates called

Yama or *Budduma*. The slave-trade formerly flourished in Bornu. In the beginning of the 19th century Bornu was conquered by the Fellatahs, whose yoke, however, was soon shaken off under the leadership of a fanatic fakir named Mohammed-el-Amin. The ruins of Birni, the old capital, on the Yaobe, may still be seen. Kuku or Kukawa, the present capital, on the west shore of Lake Tchad, has a population of about 60,000, and is one of the great centres of trade in the Sudan, carried on by caravan routes across the Sahara. See Dr A. Schulze's *Sultanate of Bornu* (trans. 1913).

Boro Budor (the 'Great Buddha'), the ruin of a splendid Buddhist temple in Java, residency Kadu, 20 miles north-west of Djokdjokarta, is the most elaborate monument of the Buddhist style of architecture anywhere existing. Buddhism was early introduced into Java, and Javanese chronicles place the building of the temple in the beginning of the 7th century; there are no inscriptions, but it was probably finished between 1400 and 1430. Boro Budor is built on a low hill,

Half-elevation of one side of Temple of Boro Budor.

between four vast volcanoes, which supplied the blocks of trachyte of which the edifice is built; its height to the cupola is 118 feet. It is a pyramid of a square form, each side at the base measuring 520 feet, and consists of seven walls, which are built like the steps of a stair up a hill. Between the walls are narrow terraces running round the building; in each is an arched doorway leading to the next higher terrace. These walls are richly ornamented with statuary. Outside are over 400 niches topped with fantastic domes, and each occupied by a large statue of Buddha. Between each of these are bas-reliefs, including figures of the god seated, and architectural ornaments and carvings of all sorts. Below the niches, on the lower story, is an immense bas-relief running round the whole building, representing scenes from the life of Buddha, and religious subjects. The inner faces of the building are also profusely ornamented with bas-reliefs, representing battles, sea-fights, processions, and chariot-races, carried to an extent unrivalled by any other building in the world. Of the large reliefs alone there are over 2000; and most of them are as vigorously designed as they are carefully executed. Within the upper square terrace are three circular ones, the outer ornamented with 32, the next with 24, and the upper with 16 small bell-shaped shrines (*dagops*), each containing a seated statue of Buddha, which can be seen through the open works of their roofs. The whole is surmounted by a cupola, the principal and probably the most ancient part of the structure. It is now empty, a sunken chamber 10 feet deep representing what was, no doubt, a *dagop* intended to contain the precious relic for which this splendid temple was erected. The niches containing the cross-legged figures have been supposed to be a copy, in durable architecture, of the

cells of a Buddhist monastery, each occupied by a shaven priest; the cupola is rather to be classified with the topes or stupas of Afghanistan. The structure is thus a compound of a Tope (q.v.) with a durable copy of the frail cells of a Vihara.

See Leemans, *Boro-Boedoer* (Leyden, 1873); Scheltema, *Monumental Java* (1913).

Borodin, ALEXANDER PORFYRIEVICH (1834-87), Russian composer, was born and died in Petersburg. He was first an army doctor, then a professor of chemistry. He composed songs, chamber music, symphonies, and the unfinished opera *Prince Igor* (completed by Rimsky-Korsakov and Glazunov).

Borodino, a village of Russia, on the Kaluga, an affluent of the Moskwa, 70 miles W. of Moscow, gave name to a great battle between the French under Napoleon and the Russians under Kutusoff, 7th September 1812, one of the most obstinately disputed in history. The loss on both sides was almost equal. Out of 257,000 men engaged, between 70,000 and 80,000 were killed and wounded. The Russians retreated on the following day, but in the most perfect order, and therefore claim victory; but the honour certainly belongs to the French, who name the battle from the Moskwa.

Boroglyceride, prepared by heating together 62 parts of boric acid and 92 of glycerine, is extensively used as a food-preservative and antiseptic.

Boron (sym. B, eq. 11) is a non-metallic element present in boric acid and Borax (q.v.). It was discovered in 1808 by Gay-Lussac and Thenard in France, and Davy in England. In some respects boron resembles carbon, existing like it in the so-called amorphous, graphitoid, and diamond forms. In the amorphous or pure state, prepared by heating boric anhydride with sodium, it is an olive-green powder, very slightly soluble in water, and unaltered by exposure to moist air. When heated in air, it takes fire, uniting with oxygen to form boric anhydride, B_2O_3 (see BORACIC ACID). The graphitoid and diamond boron are not pure forms of the element, but contain a definite proportion of Aluminium (q.v.). The diamond boron is obtained by heating the amorphous form to a high temperature, along with aluminium, when boron is left as minute crystals interspersed through the earth alumina. These crystals possess great interest from their similarity in properties to pure crystallised carbon, or the diamond. They are remarkably transparent, are tinged yellow or red (though the colours may be accidental), and rival the ordinary diamond in their lustre and refractive power. Boron diamonds not only scratch glass, but also the corundum and the sapphire; they are, however, somewhat softer than real diamonds. It was at first hoped that as the method of manufacture became perfected they would be obtained sufficiently large to become a serious rival to the diamond. They are very indestructible, even withstanding a temperature high enough to burn the true diamond.

Boron forms no compound with hydrogen, forms but one oxide, boracic or boric anhydride, B_2O_3 , while it unites with chlorine and bromine directly to form a chloride, BCl_3 , and bromide, BBr_3 .

Bororos, a numerous and powerful people of southern Brazil, inhabiting the upper basins of the Paraná and the Paraguay. Exceptionally tall, they are thought by some to be the parent stock of the Patagonians. They are hunters, and use large bows.

Borough, in Scotland BURGH (O.E. *burg*, *burh*, *burnh*; in the dative, &c., by umlaut, *byrig*, from *byrg*, whence the form *bury* in some place-names whose modern pronunciation is possibly but not necessarily of Kentish origin), meant formerly a fortification or castle, and latterly the

aggregate of houses, churches, and other structures, which in unsettled times were usually gathered under the walls of a castle, together with their inhabitants, and the arrangements which were made for their government. The questions whether we owe our municipal corporations to Roman, or to Saxon and other Teutonic influences, or to both; and if to both, then to what extent they have severally contributed to their formation, have been keenly discussed by constitutional historians. In so far as etymology goes, its authority is pretty equally divided, the term *municipal*, from the Latin *municipalis*, and *city*, from *civitas*, favouring the Roman view; whilst *borough*, from the root above indicated, and *town*, from the Anglo-Saxon *tūn*, 'an inclosure' (cf. Ger. *zaun*, 'hedge'), support the Teutonic. But the discussion forms a branch of a very wide subject, which has divided recent writers into two opposite schools. The Teutonic side is espoused by most of the Anglo-Saxon scholars of England, and in general by German writers. But from whatever source derived, that the boroughs of England in Saxon times existed, not as aggregates of houses merely, but as organised or quasi-corporate bodies, is now generally admitted. The burgh system of Scotland is also of great antiquity. A *Hanse*, or confederation of free burghs for mutual defence and the protection of trade, existed in Scotland, and was known by this name in the reign of David I. (1124-53), more than a century before the formation of the Hanseatic League of the continental cities; and the famous Burgh Laws date from about the same period. 'This code of Scotch burghal regulation,' in Mr Cosmo Innes's opinion, 'though collected in the reign of David, and sanctioned by him, was the result of the experience of the towns of England and Scotland'; and Mr Innes points out the close resemblance between these laws and the burghal usages of Newcastle, and even of Winchester, which seems to suggest their common Saxon origin. Mr Innes also speaks favourably of the burgh life of our ancestors, and considers the burgh domestic architecture, of which monuments remain, sufficient to show that 'the burgess of the Reformation period lived in greater decency and comfort than the laird, though without the numerous following, which no doubt gave dignity if it diminished food.'

Of the boroughs and cities of the middle ages, some were entirely free; they had, like the provincial towns of Italy before the extension of the Roman conquests, a constitution independent of any other powers. Venice, Genoa, Florence, Hamburg, and Lübeck all stood in this position. Next in dignity were the free imperial cities in Germany, which, not being comprehended in the dominions of any of the princes, were in immediate dependence on the empire. Most of these cities rose into importance in the 13th century; and their liberties and privileges were fostered by the Franconian emperors, to afford some counterpoise to the growing power of the immediate nobility. Nürnberg was especially celebrated for its stout resistance to the House of Brandenburg, and the successful war which it waged with the Franconian nobility. In England, the more important cities were immediate vassals of the crown; the smaller municipalities sometimes owned a subject superior, sometimes a greater municipality for their overlord.

Under the Anglo-Saxons, the English boroughs were subject to the rule of an elective officer, called the 'Portreve', who exercised in the borough functions similar to those of the shire-reve in the shire. The Norman conquerors recognised the already existing privileges of the towns by granting them charters. Instead of a shire-reve, a viscount was placed by the king over each shire, and a bailiff

instead of the former elective officer over each borough. In the larger towns, the bailiff was allowed to assume the Norman appellation or Mayor. The municipal franchise seems to have been vested in all the resident and trading inhabitants, who shared in the payment of the local taxes, and performance of local duties. Titles to freedom were also recognised on the grounds of birth, apprenticeship, marriage, and sometimes free gift.

In all the larger towns during the Norman reigns the trading population came to be divided into guilds, through membership of which admission was obtained to the franchise. Eventually the whole community in a borough was enrolled in one or other of these, each of which had its property, its by-laws, and its common hall, and the community elected the chief officers. It was on the wealthier and more influential inhabitants that municipal offices were generally conferred; and the practice gradually gained ground of these functionaries perpetuating their authority without appealing to the popular suffrage. Contentions and disputes arose regarding the right of election, and eventually the crown threw the weight of its influence into the scale of self-elective ruling bodies. As the greater municipalities grew in strength, we find their right recognised to appear in parliament by means of representatives. The sheriffs were considered to have a discretionary power to determine which towns should, and which should not have this privilege of representation. The sovereigns of the House of Tudor and Stuart acquired the habit of extending the right of parliamentary representation to boroughs not in the enjoyment of it, while at the same time, by granting or renewing to them municipal charters, they modelled the constitution of these boroughs to a self-elective type, and restricted the right of voting in the choice of a representative to the governing body. During the reigns of William III., Anne, and the earlier Georges, the influence of the crown was largely employed in calling new municipal corporations into existence, with a view of creating additional parliamentary support for the ministry in power. The burghs of Scotland had a history much like that of the boroughs of England; their charters in early times were often mere recognitions of already existing rights, and were granted to the inhabitants at large.

In its modern sense, a borough (*or* burgh) is commonly understood to mean either an incorporated city or other town that sends burgesses to parliament—a privilege the nature and extent of which will be explained under Parliament (q.v.), or simply an incorporated city or town having municipal government. Apart from their importance as areas for the parliamentary franchise, boroughs are important units of local government in the United Kingdom. Following, as a necessary consequence, the great change in the political franchise introduced by the Reform Act of 1832, came the reconstitution of the municipal corporations—separate acts of parliament for this purpose having been passed for England, Scotland, and Ireland respectively within the succeeding ten years.

I. In England, by the Municipal Corporations Act, 1835, one definite form of government was imposed upon boroughs, and all charters, customs, &c. inconsistent with the purpose of the act were abrogated. Of municipal boroughs in England, 178 were included in the Act of 1835, differing greatly both in population and rateable area. By the Municipal Corporations Act, 1882, the last-mentioned act and various amending statutes were consolidated and amended. The boroughs are governed by town-councils, consisting of a mayor, aldermen, and common council of burgesses. The mayor and aldermen are chosen

by the council, and the councillors are elected by ballot by the burgesses. They serve gratuitously; but in London and many large boroughs the mayors receive an allowance. The qualification required for a councillor or alderman is, in addition to ordinary burgess-ship, £1000 property, or £30 rating, in the larger boroughs (when divided into four or more wards), and £500 property, or £15 rating, in other cases. On the other hand, the qualification required for the municipal franchise is occupation of house or lands, as owner or tenant, during the qualifying period, or being the wife of one so qualified. Females are entitled to exercise the municipal franchise, and to be elected to the council, and become mayor. The tenure of office is in the case of the mayor one year, in the case of the aldermen six years, in the case of the councillors three years. The town-clerk, the treasurer, and other officials are appointed by the council, and receive fixed salaries.

Many of the larger boroughs possess a separate commission of the peace. Under the Municipal Corporations Act the mayor and ex-mayor are *ex officio* justices of the peace, and the other borough magistrates are appointed by commission from the crown. They are as magistrates unpaid, but in some of the larger boroughs a stipendiary magistrate for judicial work has been appointed by the crown on the application of the town-council, his salary being paid out of the borough funds. A borough may also obtain the right by petition to the crown to hold a separate quarter-sessions, which involves the appointment of a salaried recorder and clerk of the peace. This gives freedom from control of county justices, and from payment of county rate.

As regards the administrative functions of the corporation, the principal are to provide for the watching (by means of a force of borough constables) and the lighting of the borough, as prescribed by the Municipal Corporations Act, 1882; and to enforce the sanitary laws under the Public Health Acts, 1873 and 1875. In its capacity as sanitary authority, the town-council has power to regulate sewerage, burial-grounds, water and gas supply, common lodging-houses, baths, and other sanitary matters. The execution of the Elementary Education Acts has also been entrusted to the borough councils where the population of the borough exceeds 10,000 (school-boards having been abolished in 1902 by 2 Edward VII. chap. 42); and certain other functions have been assigned to them, such as the regulation of weights and measures, and the establishment of free libraries.

Expenses of Administration.—The expenses incurred by the council in the exercise of their functions are ordinarily defrayed out of the *Borough Fund*, supplemented where necessary by a *Borough Rate*. The borough fund was expressly defined by the Municipal Corporations Act, 1835, which declared that the rents and profits of all hereditaments, and the interest, dividends, and annual proceeds of all moneys, dues, chattels, and valuable securities belonging or payable to any body corporate named in conjunction with a borough in the schedules, or to any member or officer thereof in his corporate capacity, and every fine and penalty for any offence against this act (the application of which has not been already provided for), shall be paid to the treasurer of such borough; and all the moneys which he shall so receive shall be carried by him to the account of a fund to be called 'the Borough Fund;' and such fund, subject to certain payments and deductions, shall be applied towards the payment of the salary of the mayor, and of the recorder, police magistrate, town-clerk, treasurer, and other officers, and towards various other ex-

penses. In a few favoured boroughs the borough fund is large enough to meet the whole costs of administration and to leave a surplus, which must be applied, not as of old in private bounties, but for the benefit of the inhabitants and improvement of the town. The borough rate, on the other hand, which has to be levied to a greater or less extent in most boroughs, is similar to the county rate. Authorised by the Municipal Corporations Act to be levied in all cases where there is a deficiency of borough fund, it is intended to meet the maintenance of the police force, borough jail, public baths and wash-houses, public libraries, parks and cemeteries, and lunatic asylums, together with 'general expenses.' These 'general expenses' include the expense of paving, lighting, sewerage, and all appropriate town improvements. The school rate is also included in the borough rate. Where parties consider themselves aggrieved by a borough rate, they may appeal to the recorder at the next quarter-sessions for the borough; or, if there be no recorder, to the next county quarter-sessions.

Besides boroughs proper under the Municipal Corporations Act, there have been other organisations of a burghal character with administrative boards possessing many of the powers of town-councils. Of 'Local Government Districts,' a very large number were constituted under the Public Health and Local Government Acts, and the 'Improvement Act Districts' were constituted under various local acts. Certain semi-urban districts were constituted under the Lighting and Watching Act, 1833.

The Local Government Act of 1888, which established county councils, also created a new description of borough—viz. county boroughs (see COUNTY). By this act towns of not less than 50,000 inhabitants were given powers of municipal administration wholly independent of the county councils, while those of less than 10,000 inhabitants had their powers and duties transferred to the county councils. The governing bodies under the Public Health Acts and other acts were made uniform and became urban or rural district councils, and were made the public health and highway authorities for the respective districts. For the unique position of the City of London with the metropolitan boroughs, see the article LONDON.

II. In Ireland the term *Borough* is not much used as a designation for cities and towns, either in their parliamentary or municipal character. The history of burghal life in Ireland prior to last century shows an absence of that free and vigorous life which was to be found in the sister-kingdoms. The Irish towns are partly corporate, partly governed by commissioners. The corporate towns, or boroughs proper, were regulated by the Irish Municipal Reform Act, 1840. Eleven corporate boroughs are each governed by a mayor, aldermen, and councillors, the numbers varying from sixty in Dublin to twenty-one in Wexford. Aldermen and councillors are elected for three years, and administer the ordinary affairs of the borough, such as lighting, cleaning, watching, and all sanitary business.

The Local Government Act, 1898, assimilated local government in Ireland to that of England and Wales. It established three groups of municipal organisation—(1) county boroughs; (2) urban districts; and (3) certain smaller towns with commissioners, but having their rates assessed by their county councils. The county boroughs (which include only six of the corporate boroughs mentioned above—viz. Dublin, Belfast, Cork, Limerick, Londonderry, and Waterford) have had no substantial change made in their organisation beyond the extended franchise. The urban districts include the other five corporate boroughs (which retain

their corporations), and unincorporated towns of a certain size. They have the administration of the Public Health and Housing of the Working-classes Acts, are independent, and raise their own rates. All the governing bodies are now elected on the parliamentary franchise, all the old property qualifications and privileges being abolished. Women may sit on urban, and now also on county, councils. There are many small towns which, having no municipal authorities, fall within the rural administration.

III. In Scotland, the word *burgh* corresponds to the English *borough*. There were originally three distinctive classes of burghs—viz. *burghs of barony*, *burghs of regality*, and *royal burghs*. The effect of the Reform Act, 1832, was to bring into existence a new class—what are called *parliamentary burghs*—i.e. towns or burghs not being royal burghs, but sending or contributing to send representatives to parliament, under the Act 2 and 3 Will. IV. chap. 65. Besides these, the necessities of modern urban life have created yet another class; for, by the General Police Act for Scotland, the word *burgh* was declared to mean also any 'popular place,' the boundaries of which are fixed by the act.

(1) **BURGHs OF BARONY** are corporations consisting of the inhabitants of determinate tracts of ground within the *Barony*, and municipally governed by magistrates and a council (or sometimes by magistrates alone), whose election is either dependent on the baron superior of the district, or vested in the inhabitants themselves. Sometimes their charter of incorporation gave them power to create subordinate corporations and crafts, as in royal burghs; but all exclusive privileges of trading in burghs are abolished by the 9 and 10 Vict. chap. 17. The magistrates (along with the council when there was one) have power to administer their corporate property (*common good*, as it is called), to elect their burgh-officers, and to make bye-laws. They may be (where the inhabitants so resolve) the local authority for executing the provisions of various statutes affecting urban interests—as, for instance, matters of police under the General Police Acts, 1850 and 1862; and sanitary matters under the Public Health Act, 1867. But where separate police commissioners have been elected for burghs of barony, separate from the burgh council, the administrative functions of the latter become merged in those of the former. A proportion of the land-tax is payable by burghs of barony.

(2) **BURGHs OF REGALITY** were burghs of barony, spiritual or temporal, enfranchised by crown charter, with regal or exclusive criminal jurisdiction within their own territories, and thence called *Regalities*. Some of these burghs of regality, especially those which were dependent on the greater bishops and abbots, were of high antiquity, and possessed jurisdiction and privilege of trade only distinguishable from those of royal burghs by being more circumscribed in their limits. Since the abolition of hereditary jurisdictions, by the Act 20 Geo. II. chap. 43, the distinction between burghs of regality and burghs of barony has ceased to be of any practical importance.

(3) **ROYAL BURGHs**.—A Royal burgh is a corporate body deriving its existence, constitution, and rights from a royal charter—such charter being either actual and express, or presumed to have existed, and by the accident of war and time to have perished. By a Scots act passed in 1469, a constitution was given to royal burghs, by which the right of appointing their successors belonged to the old councils, the act also containing the singular provision, that when the new council was chosen, the members of it, *along with those of the old council*, should choose all the office-bearers of the

burgh, each craft or trade corporation being represented at the election by one of themselves. But this simple plan was not universally adopted, and the election gradually lost its former free and popular form—a close and exclusive proceeding being ultimately established in its place. This 'close system,' as it has been called, notwithstanding its repugnancy to the spirit of the times and modern ideas of public administration, continued in force until the year 1833, when an act of parliament was passed, the 3 and 4 Will. IV. chap. 76 (amended by the 4 and 5 Will. IV. chap. 87, and the 16 Vict. chap. 26), by which it was abolished, and an entirely new constitution given to royal burghs, with the exception of nine of them, which, on account of the smallness of their population, were left unchanged till the passing of the Municipal Elections Amendment Act (Scotland) in 1868.

At the union of England and Scotland there were seventy royal burghs, all of them except four (viz. Auchtermuchty, Earlsferry, Falkland, and Newburgh) returning members to the Scottish parliament. Two royal burghs (Rothessay and Peebles) were deprived of the burgh parliamentary franchise in 1832, nine (Stranraer, New Galloway, Whithorn, Wigtown, North Berwick, Haddington, Dunbar, Jedburgh, and Lauder) in 1885, and many others in 1918. One town—viz. Coatbridge—was created a municipal burgh with the municipal privileges of royal burghs by special act of parliament in 1885.

Under the Municipal Acts of 1833 and 1868 burghs are governed by corporations composed of a provost, magistrates, and councillors elected by the citizens. The number of members of a town-council varies. By the Representation of the People Act, 1918, a man is qualified for registration as an elector if he is owner or occupier of lands and heritages of the yearly value of £10, or occupier as owner or tenant of a dwelling-house, or occupier of lodgings worth £10 unfurnished. A woman is qualified on the same conditions; or if she is the wife of a man so qualified, and is over thirty years of age. The councillors are chosen from among the electors residing, or personally carrying on business, or holding property within the royalty; and formerly, where there was a body of burgesses in the burgh, each councillor, before his induction, required to be entered a burgess, but by an act passed in 1876 the right of burgess-ship was practically extended to all resident ratepayers. By 44 and 45 Vict. chap. 13, sect. 2, women who were unmarried, and married women living separate from their husbands, were admitted to the municipal franchise, but they could not till 1907 be elected town-councillors. The electors of Edinburgh, Glasgow, Aberdeen, Dundee, Perth, and several other of the larger burghs, are divided into wards. At the election immediately succeeding the passing of the act, each ward elected six councillors; but as every year the third part of the council goes out of office in the order prescribed by the act, two councillors are now annually chosen by each ward, there being no bar, however, to the re-election of an outgoing councillor. It is now competent for burghs with a population above 5000 to be divided into wards for the purpose of municipal as well as parliamentary elections by resolution of a majority of two-thirds of the council to that effect. The electors in other burghs choose the whole council exactly as these wards do their proportion of it, and consequently elect each year a third part in place of that which has retired. Upon the third lawful day after the election succeeding the passing of the act, the councillors meet and choose, by a plurality of voices, a provost, bailies, treasurer, and other office-bearers, as existing in the council by the 'sett' or usage of the burgh. Vacancies taking place

during the year by death or resignation are supplied, *ad interim*, by the remaining members of the council, and the persons so elected by the councillors retire at the succeeding election. The rights of the guildry, trades, &c. to elect their own dean of guild, &c., are still preserved; but these officers are now no longer recognised as constituent members of the council, their functions being performed by a member of the council, elected by a majority of the councillors. In Aberdeen, Dundee, and Perth, however, the dean of guild, and in Edinburgh and Glasgow the convener of trades and the dean of guild, are, *ex officio*, members of council; and the electors in all the above-named burghs choose such a number of councillors as, together with these officers, makes up the proper number. No magistrate or councillor can be town-clerk. The magistrates and council possess the same powers of administration and jurisdiction as were enjoyed by the magistrates and town-council before the passing of the act, and none of them is responsible for the debts of the burgh, or the acts of his predecessors, otherwise than as a citizen or Burgess. The existing council in all burghs royal must every year make up, on or before the 15th of October, a state of their affairs, to be kept in the town-clerk's or treasurer's office. The administration, powers, rating, &c. are similar to those of municipal boroughs in England.

From an early period in Scottish history the royal burghs have been in use to consult together and take common action in matters concerning their welfare. Evidence of this is found so far back as the middle of the 12th century, when the court of the Four Burghs (Edinburgh, Berwick, Stirling, and Roxburgh) met under the presidency of the High Chamberlain of Scotland. This court was superseded in the 15th century by the meeting of representatives of all the royal burghs. This was called the *Convention of Royal Burghs*, and according to the Scottish Act, 1487, chap. 3, which organised it, the duties of the convention were to deal with 'the welfare of merchandise, the gude rule and statutes for the common profit of burrows, and to provide for remeid upon the skaith and injuries sustained within the burrows.' The convention still meets annually in Edinburgh, and though shorn of much of its previous influence, it still shows a considerable amount of vitality, particularly in furthering legislative measures which may be useful to trade. The convention is recognised as a corporation. The proportion of the land-tax payable by royal burghs is also adjusted by the convention. By an act passed in 1879, parliamentary burghs (see below) are enabled to send representatives to the convention.

(4) **PARLIAMENTARY BURGHS.**—For municipal purposes these burghs stand practically in the same position as royal burghs, being regulated by the Municipal Reform Acts of 1833 and 1868. The boundaries of parliamentary burghs, being fixed for the first time by the Reform Act of 1832, were adopted by later acts for municipal purposes. By the Burgh Police Acts, 1892 and 1903, these boundaries can be modified. A number of parliamentary burghs were previously burghs of barony and regality, their character as the latter being merged in the former. Many were merged in county constituencies in 1918.

(5) **POLICE BURGHS.**—Prior to 1883 it was necessary for towns desiring to make provision for police and sanitary matters to obtain special acts of parliament for the purpose. In that year the first General Police Act was passed, laying down certain general provisions for watching, lighting, and cleansing, which might be adopted by a royal, regality, or barony burgh. Other general acts were passed in 1880 and 1862 (25 and 26 Vict.

chap. 101), but the existing General Police Act was passed in 1892 (55 and 56 Vict. chap. 55), amended in 1893 and 1894, which supercedes the earlier ones. In the last-named act 'burgh' includes ordinarily all burghs and populous places whose boundaries have been fixed; and it is provided that the sheriff may fix the boundaries and so constitute a burgh in this sense, for purposes of improvement and police, at the instance of the magistrates and council or of any seven or more householders.

The local authority in purely police burghs is the police commissioners. Their number varies, and in the case of towns divided into wards the number must be so arranged that each ward be represented by three members. The commissioners are elected in the ordinary way. The commissioners hold office for three years, retiring annually by thirds, or as nearly as may be. They choose magistrates, one senior or chief, called provost, and two or more junior magistrates. The principal administrative functions of the commissioners are watching, paving, cleansing, lighting, and improving the burgh. The expenses are defrayed by a rate called 'Police Assessment,' levied upon occupiers of lands within the burgh.

Four of the Scottish burghs are technically termed 'counties of cities'—namely, Edinburgh, Glasgow, Dundee, and Aberdeen. The Town Councils (Scotland) Act of 1900 consolidates and, in various matters of detail, amends the law relating to the election and proceedings of town-councils in Scotland.

BURGH LAWS (*Leges Burgorum*), in Scottish legal history, was the name given to a collection of ancient laws relative to burghs, which claim to have been enacted in the reign of King David I. in the 12th century. See *REGIAM MAJESTATEM*.

In the United States of America and in the British colonies, cities and towns have grown up and have been organised in accordance with (speaking generally) the most enlightened ideas of modern civic life. According to the opinion of American constitutional lawyers, the city or borough organisation is regarded as a grant from the state for the purpose of carrying out minor matters of civil government in urban communities. It has attached to it the general powers inherent in all corporate bodies, with powers to make bye-laws.

See the articles **BURGESS**, **CITY**, **CORPORATION**, **COUNTY**, **EDUCATION**, **GUILDS**, **LICENSING LAWS**, **LIVERY**, **LOCAL GOVERNMENT**, **MAYOR**, **MUNICIPALITY**, **PARLIAMENT**, **PROVOST**, and **TOWNSHIP**; Gneist, *Self-government* (3d ed. 1871) and other works; Webb, *English Local Government* (1908); Redlich and Hirst, *Local Government in England* (1903); Rogers, *Registration, Parliamentary and Municipal* (new ed. by Carter, 1887); books on the history and law of municipal corporations by Arnold, Chambers, Lely, Owen, Rawlinson, Saunders, Vine, &c.; Mrs Green, *Town Life in the 15th Century* (1894); Albert Shaw, *Municipal Government in Great Britain* (1895); F. J. Goodnow, *Municipal Home-Rule* (1895); Maine, *Early Institutions*; Stubbs, *Constitutional History*; and Maitland, *Township and Borough* (1898); Bullard and Tait (ed.), *British Borough Charters, 1216-1307* (1923); D. Boroughbridge, a small market-town of Yorkshire, on the Ure, 21½ miles NW. of York. Edward II., in 1322, defeated the Earl of Lancaster here. Hard by are three great monoliths, called the 'Devil's Arrows,' 16 to 22 feet high.

Borough English, a custom that prevailed in some ancient boroughs in England, according to which the youngest son inherited the heritable property within borough in preference to his elder brothers. The origin of this custom has not been satisfactorily determined. One reason assigned for

it is that the youngest son, on account of his tender age, was not so capable as his elder brothers of maintaining himself. Another explanation is that it was the result of the so-called *Jus Primæ Noctis* (q.v.); but the existence of this custom is more than doubtful. Maine suggested that it was derived from the *Patria Potestas* (see FAMILY); Elton that it was a survival from pre-Celtic, pre-Aryan usages. A posthumous son was entitled to this privilege, and dispossessed his elder brother. The right of representation also existed with reference to it, for if the youngest son died in his father's lifetime leaving a daughter, she inherited the property. This custom obtained in parts of Kent, Surrey, Sussex, Middlesex, Somerset, and more rarely elsewhere. It was abolished by the Administration of Estates Act, 1925. See GAVELKIND, KIN (NEXT OF), PRIMOGENITURE; Elton, *Origins of English History* (1882); Pollock and Maitland, *History of English Law* (1895).

Borovitchi, a town of Russia, on the river Msta, 98 miles E. of Novgorod; pop. 10,000.

Borovsk, a town of Russia, 49 miles NNE. of Kaluga. Near it is a convent founded in 1477, once one of the richest in Russia. Pop. 10,000.

Borromeo's Islands, a group of four small islands on the west side of Lago Maggiore, Northern Italy. They are situated in the western arm of the lake, and are named after the ancient family of Borromeo. Vitaliano, Count Borromeo, about 1671, caused soil to be carried to them, built terraces, and converted them into beautiful gardens. The two most celebrated are *Isola Bella* and *Isola Madre*. On the west side of *Isola Bella*, which rises above the water in ten successive terraces, stands a palace of the Borromeo family, containing many admirable paintings and other works of art. *Isola Madre* is laid out in the same terraced style, and is crowned by a now dilapidated palace. The *Isola de' Pescatori* is inhabited by about 200 fishermen. Jean Paul Richter has described the place in his *Titan*.

Borromeo's, CARLO, St., a great churchman and saint of the 16th century, was born 2d October 1538, at his father's castle of Arona, on the Lago Maggiore. He studied law at Pavia, took the degree of doctor in 1559, and next year was appointed in quick succession by his uncle, the new Pope Pius IV. (formerly Cardinal de' Medici), apostolic protonotary, cardinal, and Archbishop of Milan. As a counsellor of the pope the young cardinal showed wisdom beyond his years, did much to bring the Council of Trent to a successful conclusion, and had the principal part in drawing up the famous *Catechismus Romanus*. The saintly simplicity of his manners, his ardent piety, and his self-forgetful devotion to duty, united to make him the ideal bishop, and have kept his memory green until the present day. But his own severe morality and his determined efforts to maintain ecclesiastical discipline drew upon him the hostility of the monastic orders, and in 1569 a wretch of the order of the Umiliati actually shot at the archbishop as he knelt at prayer in his chapel. Borromeo devoted the greater part of his revenues to the relief of the poor, and during the famine of 1570, and the plague at Milan in 1576, showed such energetic benevolence and fearless devotion as to make his name a proverb throughout Christendom. To provide priests for Switzerland, he founded in 1570 the Helvetic College at Milan; and he brought about an alliance of the seven Catholic cantons. He gave his blessing to Campion and Parsons on their way to stir up rebellion in England. Exhausted by his labours and his austerities, he died 4th November 1584. He was canonised by Pope Paul V. in 1610. His embalmed

body may be seen in the crypt of Milan Cathedral. His works appeared in 1747 in 5 vols. folio. See Lives by Sailer, Dieringer, Sala, Sylvain, Giussano (trans. with preface by Cardinal Manning, 1884), and Thompson (1893).—His brother's son, COUNT FEDERICO BORROMEO, born 1562, was also from 1595 Cardinal-Archbishop of Milan, where he founded the Ambrosian Library. He died in 1631.

Borrow, GEORGE HENRY, was born at East Dereham, Norfolk, 5th July 1803. His father, Thomas Borrow, a captain of militia, during the war moved about with his regiment in England, Ireland, and Scotland (where Borrow attended the Edinburgh High School), then settled at Norwich, where young Borrow attended the grammar-school (1816–18), and for the next five years was articled to a firm of solicitors. Already he deserved his Gypsy title *Lavengro* ('word-master'), having picked up a knowledge of Irish, French, German and Danish (these two under 'Taylor of Norwich'), Welsh, Latin, Greek, even of Romany, the language of that strange Gypsy race of which he was almost an adopted member. On his father's death in 1824 he came up to London to seek his fortune, and fared ill as hack-writer to Sir Richard Phillips the publisher. Anon he wandered Gypsy-wise through England, and, on his wanderings, was all but poisoned by a Romany beldame, fought and vanquished the Flaming Tinman, with Isopel Berners tented in Mumper's Dingle, and met with other moving accidents (are they not chronicled in his own book, *Lavengro*?). Next—and here facts and dates are again realities, without any suspicion of fancy—as agent of the Bible Society he visited St Petersburg (1833–35), and Portugal, Spain, Morocco (1835–39). In 1840 he married a well-to-do widow, and settled down on a small estate of hers at Oulton, near Lowestoft, where, after travels in South-eastern Europe (1844), a tour in Wales (1854), and a residence of some years in London, he ended his days, 26th July 1881. The chief of his fourteen published works are: *The Zincali, or Gypsies of Spain* (1840); *The Bible in Spain* (1842); *Lavengro* (1851); its sequel *The Romany Rye* (1857); *Wild Wales* (1862); and *Romano Lavo-Lil, or Word-book of the English-Gypsy Language* (1874)—six works, of which the first three increased, as the last three fell off, in vigour and interest. All but the first and last are autobiographical; and even the *Zincali* and *Lavo-Lil* are full of the author's strong individuality. He has been likened to Cervantes, Defoe, Lesage; 'a Lesage in water-colours' is how he described himself. In truth, all three were in some ways his literary progenitors; none the less he is always original, always George Borrow, with his love of horseflesh, boxing, strong ale, and open-air life, his hatred of gentility, priestcraft, cant of any kind. His rare mastery of good strong English, his rarer power of depicting mankind and nature, are often marred by studied mannerisms, transparent mystifications, unreasoning crotchets, Manfred-like posings. Not that here lay his chief offending. He was too English for the squeamish age that preceded the gospel of 'Muscular Christianity'; and no writer so well worth reading is even nowadays so little read. In Watts-Dunton's 'Reminiscences of George Borrow' (*Athenæum*, September 3, 10, 1881) we get a splendid picture of the man—his mighty figure, frank and childlike gaze, his fine East Anglian accent, his love of nature and love of adventure, his reverence and unswerving belief in God's beneficence, his talk—fresh, racy, whimsical—of all the wondrous things he had seen and heard in his wondrous life. 'No man's writing can take you into the country as Borrow's can; it makes you feel the sunshine, see the meadows, smell the flowers, hear

the skylark sing and the grasshopper chirrup. Who else can do it? I know of none.

In addition to his works mentioned above, Borrow compiled *Celebrated Trials* (6 vols. 1825); he edited the New Testament in Manchu (1835) and in Spanish (1837), and the Basque version of St Luke (1838); and he executed the following translations, in addition to translations which appeared in various periodicals: Klinger's *Faustus* (1825), *Romantic Ballads* (1826; reprinted 1913), *Targum, or Metrical Translations from Thirty Languages and Dialects* (1835; reprinted 1892), A. Pushkin's *Talisman* (1835), St Luke in Spanish Gypsy (1837), *Sleeping Bard, translated from the Cumbrian British* (1860), *Turkish Jester* (1884), J. Ewald's *Death of Balder* (1889), and *Welsh Poems and Ballads* (1914). The *Letters of George Borrow to the British and Foreign Bible Society* were published in 1911. For Borrow's linguistic attainments and deficiencies, consult the editions of *Lavengro* by Dr Knapp (1900) and F. Hinde Groome (1901), and the edition of *The Romany Rye* by J. Sampson (1903). See the lives by W. I. Knapp (1899), R. A. J. Walling (1909), H. Jenkins (1912), and E. Thomas (1912); W. A. Dutt's *George Borrow in East Anglia* (1896); Watts-Dunton's Introduction to *Lavengro* (1893); Clement Shorter's *George Borrow and his Circle* (1913), and his edition of Borrow's works (16 vols. 1924); R. T. Hopkins's *George Borrow* (1922); and the *Souvenir of the George Borrow Celebration* (1913), published when the Norwich residence of the Borrow family was presented to the Corporation by the Lord Mayor (A. M. Samuel) for use as a Borrow Museum; bibliographies in E. Thomas's biography, and *The Readers' Guide*, vol. ii. no. 4 (1913), published by the Norwich Public Library.

Borrowdale, a beautiful Cumberland valley, ascending from the head of Derwentwater by Wordsworth's yew-trees towards Scafell. Its rich plumbago mine was exhausted in 1850 (see **BLACK LEAD**). Slate unfortunately is still quarried. The Honister Pass leads to Buttermere, but *vestigia nulla retrorsum*, so far as horse traffic is concerned.

Borrowing. See LOAN, INTEREST, USURY.

Borrowing Days, the last three days of March (old style), supposed in Scottish folklore to have been borrowed by March from April, and to be especially stormy. In Cheshire the first eleven days of May are called 'borrowed days,' because in old style they belong to April.

Borrowstounness. See BO'NESS.

Borsippa, a town of Babylonia, across the Euphrates from Babylon. See **BABYLONIA**.

Borstal, $\frac{1}{2}$ miles S. of Rochester, has great military establishments, and a prison in which, since 1901, the 'Borstal system' of reformatory treatment for 'juvenile-adult' prisoners, sixteen to twenty-one years of age, is carried out.

Bort. See **DIAMOND**.

Borwick, LEONARD (1868-1925), English pianist, was trained in London and Frankfurt. He appeared publicly in London in 1890, and figured regularly at concerts and recitals in London and the provinces.

Bory de Saint Vincent, JEAN BAPTISTE (1780-1846), born at Agen, explored Bourbon, served in the army at Ulm and Austerlitz, on Soult's staff in Spain and as a colonel at Waterloo. He led scientific expeditions to the Morea (1829) and Algeria (1830), and wrote on his travels.

Borislav, in Eastern Galicia, 7 miles SW. of Drohobycz, in a district rich in petroleum and ozokerite; pop. 12,000.

Borysthenes. See **DNIEPER**.

Borzoi. See **WOLF-HOUND**.

Bosa, a port and cathedral city on the west coast of Sardinia, 85 miles NNW. of Cagliari; pop. 7000.

Bosanquet, BERNARD (1848-1925), philo-

sopher, born at Rock Hall, near Alnwick, was educated at Harrow and Balliol College, Oxford. From 1903 to 1908 he was professor of Moral Philosophy at St Andrews University. A Hegelian with Bradley, Bosanquet was the author of numerous philosophical works, including *Logic or Morphology of Knowledge*, *A History of Esthetic*, *The Value and Destiny of the Individual*, *A Philosophical Theory of the State*, &c.—His wife, HELEN DENDY (1860-1925), a sister of Professor Arthur Dendy the zoologist, wrote on poor-law and social subjects.

Bosboom, JON (1817-91), a Dutch painter at The Hague, who depicted interiors of churches.

Bosboom-Toussaint, ANNA LOUISA GERTRUIDA (1812-86), born at Alkmaar, was already distinguished as an historical novelist (*Almagro*, *Der Graaf van Devonshire*, &c.) when she married (1851) the painter Bosboom. Of her other novels, some dealt with the Earl of Leicester in Holland, others were modern society novels.

Boscan-Almogaver, JUAN (1490?-1542), a Spanish poet, born at Barcelona of an ancient family, was tutor to the Duke of Alva. He was the first to use Italian measures in Spanish verse, and thus became the creator of the Spanish sonnet.

Boscawen, EDWARD, English admiral, third son of Viscount Falmouth, was born in 1711. He had an important share in the victory off Cape Finisterre (3d May 1747), where he was wounded in the shoulder. He displayed high military skill in conducting the retreat from Pondichery, and in 1751 became a lord of the Admiralty. In 1755 he intercepted the French fleet off Newfoundland. In 1757 he was appointed second in command under Hawke, and in 1758 commander-in-chief of the successful expedition against Cape Breton. Boscawen crowned his career by his signal victory over the French Toulon fleet in the Bay of Lagos, 18th August 1759. He died 10th January 1761. 'Old Dreadnought,' as he was called, was notable for his ready and decisive courage.

Boscobel, on the eastern verge of Shropshire, 7 miles E. of Shifnal, was, after the defeat of Worcester (3d September 1651), for two days the hiding-place of Charles II. The 'Royal Oak' is represented by a tree grown from one of its acorns. Boscobel House, then occupied by the Penderel family, is a half-timbered dwelling. See Thomas Blount's *Boscobel* (1660-81); ed. by J. Hughes (1857), by C. G. Thomas (1894).

Bosco Reale, a village of south Italy, at the south base of Mount Vesuvius; pop. 10,000.

Boscovich, ROGER JOSEPH, a celebrated mathematician and astronomer, was born at Ragusa in 1711, and at an early age entered the order of the Jesuits. Before the completion of his course of studies at Rome, he was appointed teacher of Mathematics and Philosophy in the *Collegium Romanum* there; his reputation had been previously established by a solution of the problem to find the sun's equator and fix the time of his rotation by observing the spots. The pope gave him a commission to measure a degree of the meridian in the States of the Church. He was sent to London in 1760 in defence of the interests of Ragusa. In 1764 he was appointed to a professorship in Pavia, and subsequently at Milan. After the dissolution of his order in 1773, he went to Paris, received a pension from the king, and was appointed director of optics to the navy. Boscovich afterwards returned to Milan, but went insane. He died in 1787. His very varied works were published collectively under the title *Opera Pertinentia ad Opticam et Astronomiam* (5 vols. 1785). His name is connected with a molecular theory of

physics, first published in his *Theoria Philosophiæ Naturalis* (Vienna, 1758). He was also a poet, and his Latin poem, *De Solis ac Lunæ Defectibus* (1764), was dedicated to the London Royal Society, of which he had been elected a member.

Bosio, ANTONIO, a Roman antiquary, who died in 1629, was the first serious student of the Catacombs (q.v.). His *Roma Sotteranea*, the fruit of thirty-five years' work, appeared in 1632.

Bosio, FRANÇOIS JOSEPH, BARON, an eminent sculptor, born 19th March 1769, at Monaco, studied first at Paris, next in Italy, and first became famous by the figures which, at the request of Napoleon, he executed for the column in the Place Vendôme. Louis XVIII. and Charles X. also patronised Bosio; the former made him royal sculptor, the latter a baron. He died director of the Academy of Fine Arts in Paris, 29th July 1845.

Bosjesman. See BUSHMEN.

Bosna-Serai. See SARAJEVO.

Bosnia and Herzegovina, between Dalmatia and Slavonia, part of the Yugoslav state, long a Turkish province. The Berlin treaty of 1878 put it under the administration of Austria-Hungary. When, on occasion of the constitutional revolution in Turkey in the autumn of 1908, the united provinces were formally annexed by the dual monarchy, they had long virtually been part of it. The soil in both is fertile, but agriculture is not well developed, though cereals, flax, and hemp are grown. Herzegovina produces figs and fine tobacco, and Bosnia (which is largely under forest) is wonderfully rich in plums, exporting enormous quantities of prunes. The wine is not good; sugar-beet is now being grown. Cattle-grazing and sheep-farming are important industries, and live-stock is exported. The commerce is largely in the hands of the numerous Spanish-Jews long established in Bosnia. There are many Gypsies, and the population, both in Bosnia and Herzegovina, is typically Slav, of the Croato-Serbian branch. Under the constitution of 1910, which established a joint diet chosen by universal suffrage for the united provinces, Sarajevo, heretofore capital of Bosnia, became the administrative centre. Mostar, the old capital of Herzegovina, has about 16,000 inhabitants. The religious position is indicated by the fact that in the diet the Greek-Orthodox had allotted to them 31 seats, the Roman Catholics 16, the Mohammedans 24, the Jews 1. The Mohammedans own more than their proportionate share of landed property. Bosnia resembles Styria or Tyrol in its rugged mountainous character, its dense forests, and in the picturesqueness of its valleys. The Dinaric Alps, here attaining a maximum altitude of 7663 feet, form the water-parting between the Adriatic and Danube basins; and four rivers—the Unna, the Vrbas, the Bosna (from which the province takes its name), and the Drina—flow northwards to their confluence with the Save. Herzegovina, on the other hand, is an ill-watered country of limestone mountain masses, whose valleys are exposed in summer to broiling heat. With the exception of the Jews, Tsigans (Gypsies), a few Bulgarians and Albanians, and some Osmanli Turks, who live in the larger towns of Bosnia, all the inhabitants of the Illyrian Alps are Slavs. The Bosnians themselves, though united by race, are divided by religion, Mussulman against Christian, Greek-Orthodox against Roman Catholic. Hence, in spite of every natural advantage, they were, unlike their Serbian brethren, unable to emancipate themselves from the Turkish yoke.

The area of Bosnia is 16,200 sq. m.; of Herzegovina, 3500—jointly 19,700 sq. m. In 1920 the population was 1,876,543. About 88 per cent.

of the population are engaged in agriculture. Minerals (coal, iron, copper, manganese, &c.) are abundant. *Herzegovina* is a Slav formation from the German *Herzog*.

History.—Bosnia, in ancient times a part successively of Illyria, Pannonia, and Dalmatia, was during the great migrations occupied by Slavs or Slavonised Illyrians, at first dependent on Hungary; but it became a kingdom in 1376, under Tvartko, a native prince. Occupied by the Turks in 1401, it was annexed in 1463, but not recognised by Europe as a Turkish province till 1699. Extortionate taxation caused a rebellion of the Christians in 1849, suppressed by Omar Pasha; but a more determined rising in 1875, which the Turks failed to put down, led to the occupation of the province by the Austro-Hungarians, which the Moslem population opposed in a fierce but unavailing struggle. The treaty of Berlin formally entrusted the administration to Austria-Hungary. In October 1918 the province participated in the founding of the Yugoslav state. Since 1880 extraordinary progress has been made in roads, railways, finance, and commerce. See A. Evans, *Through Bosnia and Herzegovina on Foot* (1876); Asbóth, *Bosnia and Herzegovina* (trans. 1889); Munro, *Bosnia, Herzegovina, and Dalmatia* (2d ed. 1900); and books cited at BALKAN PENINSULA.

Bosporus (also BOSPHORUS, Latinised forms of a Greek word meaning 'ox-ford'), the ancient name of the channel which separates Europe from Asia, and connects the Black Sea (*Euxine*) with the Sea of Marmora (*Propontis*). It was so called, according to the legend, from Io, who swam across in the form of a cow. Afterwards, as the same name was bestowed upon other straits, this was designated the *Thracian Bosporus*. Both its south and north entrances have light-houses on either side. Its shores are elevated, and throughout its length the strait has on either side seven bays or gulfs, with corresponding promontories on the opposite side. One of these gulfs forms the harbour of Constantinople, or, as it is often called, the Golden Horn. Across the Golden Horn is Pera, and opposite the imperial city, on the other side of the Bosporus, is Scutari. The length of the Bosporus is about 17 miles, with a breadth of from little more than a third of a mile to two miles, and its average depth is about 30 fathoms. Both sides look highly picturesque from the deck of the steamers plying up and down the straits, being richly dotted with cypresses, laurels, and ancient plane-trees, and covered with palaces, kiosks, villages, villas, and gardens. Darius built a bridge of boats across. The Bosporus having fallen under Turkish control, repeated European conferences, including that of Berlin in 1878, confirmed the stipulation of the treaty made in 1841 that no ship of war belonging to any nation but Turkey should pass through it without the consent of the Ottoman authorities. The Treaty of Lausanne, July 1923, gave back to Turkey control of the Straits, subject to certain regulations for demilitarisation and freedom of transit to war and merchant ships, subject to reasonable limitation of numbers.

The CIMMERIAN BOSPORUS of the ancients was the Strait of Kaffa (q.v.), Yenikalé, or Theodosia. The country on both sides of the Cimmerian Bosporus formed, about 500 B.C., a kingdom which grew till it embraced the whole Crimea, and of which the capital was *Panticapæum*. Many of its kings were in close alliance with the Athenians, but it at length became tributary to the Scythians.

Bosquet, PIERRE FRANÇOIS JOSEPH, French marshal, born 8th November 1810, at Mont de Marsan, in Landes; entered in 1834 the Algerian army, and reached the rank of general of brigade

in 1848. In the Crimean war, he contributed greatly to the victories of Alma and Inkermann, and took a leading part in the capture of the Malakoff, where he was severely wounded. Made senator and field-marshal in 1856, he died 5th February 1861.

Boss, in Architecture, a raised ornament, covering the intersections of the ribs of ceilings. They

Boss.—From Notre-dame la Riche, Tours.

are more frequently seen in vaulted roofs, as in the aisles of a church, but occur also where the ceiling is flat. In early Norman work there are generally no bosses, and they become richer and more frequent as we advance towards the Decorated and Perpendicular styles. In the Decorated style the boss usually consists of foliage, sometimes combined with animals, heads, and the like. Coats-of-arms, charged with armorial bearings, came then also to be used for this purpose, though they were more frequent in the Perpendicular.—The boss of a bit is the ornament with which a bridle-bit terminates at each end. It was borne in the arms of the corporation of Lorimers. See LORIMER.

Boss, a modified form of the Dutch *baas*, 'master,' is used in the United States for an employer of labour, or a local political chief; and in Britain is a slang word, or is employed humorously. To 'boss' is to play the master. See TAMMANY SOCIETY.

Bossuet, JACQUES BÉNIGNE, the greatest of French pulpit orators, was born at Dijon on the 27th September 1627, of a middle-class family. He was educated in the Jesuits' School in Dijon, and at the Collège de Navarre in Paris. He received a canonry at Metz in 1652, and soon afterwards earned distinction as a controversialist by a reply to a work of the Protestant divine, Paul Ferri. In 1661 he preached for the first time in the chapel of the Louvre before Louis XIV., who was so impressed by the discourse, that he wrote to Bossuet's father congratulating him upon having such a son. Bossuet remained at Paris until 1669. His reputation as an orator spread over France, and he became the recognised chief of the devout party at court. After holding for a short time the bishopric of Condom, he was appointed tutor to the Dauphin, for whose benefit he is said to have written his *Discours sur l'Histoire Universelle* (1679). In 1680 he was elected to the academy, and in 1681 he received the bishopric of Meaux. He took a leading part in the Gallican controversy. His *Exposition de la Doctrine de l'Eglise Catholique sur les Matières de Controverse*—in which he advocated the royal as opposed to the papal claims—was adopted by the assembly of the French clergy held in 1682. He was less fortunate in his controversy with Fénelon, whose mysticism he regarded as heretical, and whom he attacked with an excessive violence, in strong contrast to the quiet and telling irony of his adversary's reply. The king, however, and ultimately the pope, supported Bossuet. He was made a member of the Council of State in 1697,

and first almoner to the Duchess of Burgundy in 1698. He died at Paris on the 16th April 1704. Bossuet's character is not an attractive one, though he made some protest against the king's licentiousness, oppressions, and unjust wars. As a preacher he had neither the outspoken courage of Bourdaloue nor the persuasive gift of Massillon. His greatest works are the *Histoire Universelle*, regarded by many as the first attempt at a philosophy of history, and the *Oraisons Funebres*, discourses on the death of the two Henriettas of England, of Condé, of Turenne, and of the Princess Palatine. Their chief characteristics are the splendour of the diction and the sustained flight of the rhetoric. While their author cannot be classed among great original thinkers, he is not a mere weaver of eloquent words. Intense religious conviction and deep knowledge of human nature give fervour and weight to his imposing sentences. As a controversialist, he combines, when at his best, the energy of enthusiasm with great dialectic ability; grasping his subject firmly, and showing remarkable wealth and felicity of allusion and metaphor. His chief controversial work is the *Histoire des Variations des Eglises Protestantes* (1688). Bossuet was also the author of *Maximes sur la Comédie*; *Conférence avec le Ministre Claude* (1678); *Négociations avec Leibnitz* (1691); *De l'Etat Présent de l'Eglise*; *Sur la Morale Relâchée*; *Mémoires présentés à Louis XIV.* (1700); *Politique Tirée de Sainte Ecriture*, in which he upholds the divine right of kings (1709). He was admitted to the Academy in 1671.—JACQUES BÉNIGNE BOSSUET, nephew of the above, was born in 1644. He became Bishop of Troyes, where he died, 12th July 1743. He left a voluminous correspondence, dealing mainly with the controversy between his uncle and Fénelon.

The standard edition of Bossuet's works (1862-96) extends to 37 volumes. There is an edition of his *Correspondance* by Urbain and Levesque (1909 et seq.). See the *Mémoires et Journal* by his secretary, Leduc; and *Lives* by Bausset (1814), Réaume (1870), Lanson (1891), Mrs Sidney Lear (1881), and Miss E. K. Sanders (1921); studies by Rébelliau (1900, 1909), Brunetière (1913), Dummet (1918); and Verlaque's *Bibliographie* (1908).

Bossut, CHARLES, mathematician, born at Taitaras, near Lyons, 11th August 1730, was furthered in his early studies by Clahaut and D'Alembert, and was, from 1752 till the Revolution, professor at Mézières, and under the empire in the Polytechnic Schools at Paris, where he died, 14th January 1814. In the compulsory retirement that followed the Revolution he wrote his famous *Essai sur l'Histoire Générale des Mathématiques*. He edited Pascal's works (5 vols. 1779).

Boston, a municipal and, till 1918, parliamentary borough and seaport in Lincolnshire, on the Witham, 30 miles SE. of Lincoln, and 107 miles NE. of London, by rail. Its name is a contraction of 'Botolph's town,' and it is commonly supposed to occupy the site of the Benedictine abbey founded on the Witham by St Botolph in 654, and destroyed in 870 by the Danes. Under the Normans, Boston became a place of importance, and in 1204 it paid the largest dues (£780) of any English port but London (£836). In the reign of Edward III. many foreign traders settled, and the merchants of the Hanseatic League established a guild in Boston. After their departure, the town declined, and the suppression of the monasteries by Henry VIII. further injured it; but his grant of a charter of incorporation, and Mary's subsequent grant of extensive lands, partly compensated for this. The modern town consists chiefly of four good streets, two on either side of the river, here crossed by a handsome bridge. The parish church of St Botolph measures 283 by 99 feet, and is one of the largest without transepts

in England. The tower is 263 feet high, it is in the Perpendicular style of architecture, and terminates in an octagonal lantern, doubtless intended

St Botolph's Church, Boston

for a lighthouse by land and by sea, as well as a campanile, and by all the district, as seen rising above everything for miles around, is known as

The Stump. The founder's chapel is in the Early Decorated style of Edward II (1307), and the nave, aisles, and the western part of the chancel are of the Late Decorated, Edward III. In 1843 the restoration of the church was commenced, the works continuing ten years, and over £10,000 being expended. A chapel to the memory of the Rev Thomas Cotton, at one time vicar of Boston, was erected at the expense of the inhabitants of the daughter city of Boston in America. A promenade by the river is tastefully laid out, with a people's park, public gardens, and recreation ground adjoining. Boston has also a free grammar, charity, national, and other schools, a guildhall, covered markets for fish, fowl, butter and eggs, a working men's college and school of art. The clearing of the river of silt, the formation of a new channel, and the opening of a corporation dock (1880-90) greatly promoted trade. There is a fleet of trawlers belonging to the town, and shipping lines to Hull, London, and Hamburg. The river and canals furnish communication with Lincoln and other towns. For the Grand Sluice, see RIVER. Boston is a great market for cattle and sheep, and his manufactures of agricultural implements, sail cloth, ropes, sacking, beer, iron, brass, leather, with some shipbuilding. The chief exports are agricultural implements, coal, corn, and wool, and the imports consist of timber, pit props, maize, cotton seed, and general merchandise. For the martyrologist, Conington, Jean Ingelow, J W Maistron, and Ingram, founder of the *Illustrated London News*, were natives of Boston. Pop of municipal borough (1851) 14,733, (1911) 16,873, (1921) 16,100. See the history by Thompson (1856), the *Victoria History of Lincolnshire* (1904-6), and *The Parish Registers of Boston*, ed C W Foster (Lincoln Record Society, 1914-15).

Boston, the capital of Massachusetts, the county seat of Suffolk county, and one of the chief cities of the United States, is situated on an inlet of Massachusetts Bay, called Boston Harbour, at the mouths of the Charles and Mystic rivers, in 42° 21' 27" N lat, 71° 3' 30" W long, and 234 miles NE of New York by rail.

Boston possesses an excellent harbour, protected by several forts, and covering 75 sq m with a minimum depth of 35 feet at low tide, and is in all respects favourably situated both for foreign commerce and coasting trade, the harbour has four fine lighthouses, and is dotted with more than fifty islands, on some of which hospitals have been built. A whole series of lines of railway converge at this city, in the outskirts of which the Junction Rail road connects most of the lines with one another, and some ten or a dozen recognised lines of ocean steamers ply regularly to foreign ports. The chief imports are wool and woollen manufactures, hides and skins, leather and leather manufactures, cotton and cotton manufactures, iron and steel, the chief exports, meat and dairy products, wool, iron and steel manufactures, cotton, leather manufactures, and bread stuffs. Boston is the principal wool market in the United States, and second only to New York in the value of its foreign trade. The city, besides being the seat of many varied local manufactures, is the headquarters of heavy rail road, mining, and insurance interests, the active operations of which are carried on in all sections of the United States. Charlestown government navy yard is within the present limits of Boston, Dorchester, Hyde Park, Roxbury, West Roxbury, and Brighton are also within the boundary and the cities and towns of Cambridge (qv), Newton, Brookline, Revere, Winthrop, Somerville, and Chelsea are practically suburbs.

Boston is exposed to east winds, and pulmonary complaints are very prevalent, but otherwise its

Map of Boston and Vicinity

climate is healthy. It is one of the best built cities in the United States, prominent among its specimens of elaborate architecture being Trinity Church and the Roman Catholic cathedral, the former erected at a cost of \$750,000, and said to be the finest church in New England. The streets in the older portion of the city, once singularly irregular in their course, have been very generally straightened, at great expense, and most of the principal ones are traversed by tramways,

which extend for many miles, connecting with suburban towns. An extensive system of elevated railways, opened in 1901, and a subway (cost \$4,350,000) relieve the traffic of the streets. The older buildings include the State house (1795), with a conspicuous gilded dome, and fronting on the well kept Common the Old State house (1748), Old South Church (1729), Faneuil Hall (1743) afterwards termed 'The Cradle of Liberty,' and King's Chapel (1754). Among later public buildings and institutions may be noted Tremont Temple, the headquarters of New England Baptists, containing an audience hall with seats for 2600 and a fine organ, the Free Public Library, with a million bound volumes, accessible to all comers, the government Post office and Sub treasury building, of granite, erected at a cost of about \$6,000,000, the Lowell Institute for the support of free public lectures, the Massachusetts, City, and several minor hospitals, a large number of homes, asylums, and orphanages, under the charge of the various religious denominations, and city dispensaries and institutions for the insane, the blind, &c.

Boston is one of the chief educational and literary centres of the United States. Its elaborate system of public schools embraces a large number of high schools, normal and Latin schools, grammar and primary schools, and kindergartens. The Latin School, founded in 1635, and the English High School are the largest in the country. A regular system of free lectures on a wide variety of subjects also exists, and large sums of money are expended annually for school purposes. Among the higher institutions of learning are the Boston College (Catholic), the Boston University (Methodist), for the education of both sexes, schools of technology and industrial science, three conservatories of music, of high repute, schools of law and divinity, and the Harvard Medical and Dental Schools, connected with Harvard University, which, though located in the adjacent city of Cambridge, is virtually a Boston institution.

The 'Hub of the Universe' has long been noted for the interest taken by its citizens in literature, science, and art. The city possesses a large number of literary, musical, and kindred associations many of them incorporated and endowed, besides a number of social and political clubs. A recently developed and extensive series of public parks, extending in the aggregate to over 3600 acres, adds greatly to the amenity of the city.

Originally founded in 1630 upon a peninsula known as Shawmut, it was first called Timmoutain from the three hills which were then a marked feature of the territory, and was afterwards officially named Boston, after Boston in Lincolnshire, the native place of some of the principal colonists. This tract, purchased from the original settler, William Blaxton (or Blackstone), for £30, comprised 783 acres, but by successive additions the territory of the city has been increased, until, in 1888, it covered nearly 37 sq m, and in 1922 nearly 48 sq m. Among these additions are comprised the city of Roxbury, annexed in 1867, Dorchester, annexed in 1869, and Charlestown, West Roxbury, and Brighton, annexed in 1873. Charlestown had in 1870 a population of 28,000. Large tracts of ground

also have been reclaimed from the harbour and its branches, and sixteen bridges, besides the railway

Trinity Church, Boston

(From a Photograph by H. G. Peabody, Boston.)

bridges and steam ferries, connect the city with its suburbs.

Boston has been identified with many events of general interest to Americans, such as the meeting of the first grand jury (1635), and the publication of the first regular newspaper (1704). The stern, impatient Puritan spirit of its founders led to the banishment of heretics and the execution of Quakers and witches, and later, to the expulsion of James II's officials. The conspicuous part borne by the town in the early troubles with England brought about the 'Boston Massacre' of 1770, in which several people were killed by the fire of the soldiery, and after the destruction of the British taxed tea in the harbour (1773), the port was practically closed, and the town occupied by a British force, which, in March 1776, was finally compelled to evacuate the place (see BUNKER HILL). From 1830 to 1860 Boston was the headquarters of the movement for the suppression of slavery, against which its citizens had shown a strong feeling as early as 1645. The city has suffered from several destructive conflagrations, that of 1872 having been exceeded in the United States in the extent of the calamity only by the Chicago fire (1871).

Boston was the birthplace of Franklin, Copley, the painter, his son Lord Lyndhurst, Poe, Emerson, Ticknor, Sumner, and Parkman, as Cambridge was of Holmes and Lowell, while associated with it and Cambridge have been Hawthorne, Longfellow, Agassiz, Whittier, Motley, Bancroft, Prescott, Channing, Theodore Parker, Dana, Margaret Fuller, Thoreau, Aldrich, the Alcotts, Jameses, and Howells. Pop. (1800) 24,937; (1840) 93,383; (1860) 177,840; (1880) 362,839; (1900) 560,892; (1920) 748,060 (Hyde Park town being annexed meanwhile). Besides the suburbs already named are South Boston and (on Noddle's Island) East Boston. See the history of what Howells has called 'the American Athens,' by Winsor (1880-82), and *Boston, the Place and People*, by M. A. de Wolfe Howe (1903).

Boston, THOMAS, born at Duns, Berwickshire, 17th March 1676, was the son of a father imprisoned for nonconformity. He attended Duns grammar school, and in 1691 entered the university of Edinburgh. He received licence as a preacher

in 1697, and was greatly appreciated by the serious portion of the community; but his uncompromising character prevented him from receiving a clerical charge for two years. As he puts it in his autobiography, he was, 'through the mercy of God, generally acceptable to the people, but could never fall into the good graces of those who had the stroke in the settling of parishes.' At length, in 1699, he was ordained minister of Simprin, Berwickshire, and in 1707 was translated to Ettrick, in Selkirkshire, where he died on the 20th May 1732. Of his works the one by which he was best known is the *Fourfold State*, published in 1720. It discourses of human nature in its fourfold state of primitive integrity (in Eden), entire depravity (by the fall), recovery begun on earth, and happiness or misery consummate hereafter. This work went through many editions, and was long recognised as a standard exposition of Calvinistic theology. *The Crook in the Lot* was a little book of a more attractive character, written in quaint and striking style. This book and his autobiographical *Memoirs* (the latter not published till 1776) were great favourites with the Scottish peasantry; R. L. Stevenson said that of his masters in style, Boston had influenced him most. As a pastor, Boston was eminently laborious and deservedly popular. In the ecclesiastical courts he distinguished himself by his zeal in defence of the church's independence, and in the controversy regarding the *Marrow of Modern Divinity* (which was objected to as being too free in its offers of salvation) he was one of the ten ministers who declared their approval of that work (see MARROW CONTROVERSY). As a theologian, Boston had a marked influence upon his own and succeeding generations. His language, sentiments, and characteristic modes of expressing the peculiarities of Calvinistic psychology, have coloured the style of Scottish preaching more than have those of any other writer of the same school. Although often displaying what we should now call narrowness, Boston exhibits also flashes of insight and beauty, quaint felicities of diction—as, for instance, when in *The Crook in the Lot* he warns the profligate against the possibility of a 'leap out of Delilah's lap into Abraham's bosom'—and shrewdness of thought. See the Life by Thomson (1895), and Morrison's edition of the *Memoirs* (1899).

Boswell, JAMES, immortal as the companion and biographer of Dr Johnson, was born at Edinburgh, 18th October 1740. He was the eldest son of Lord Auchinleck, a judge in the Court of Session, who had taken his title from an estate in Ayrshire, which had belonged to the family since the reign of James IV. He had his education at the Edinburgh High School and at the universities of Edinburgh and Glasgow, but his impressionable nature and characteristic love of such distractions and dissipations as were available showed themselves early, and caused much dissatisfaction to the surly but shrewd old judge. A year in London at twenty spoiled him for ever for a provincial. That restless itch for writing, which was yet to lead him so far, made him, a boy of eighteen, keep an 'exact journal,' write poems and prologues to Edinburgh plays, and publish, at twenty-three, a series of would-be clever and witty letters that had passed between himself and a companion of equal age and experience. His capacity for making friends and for falling temporarily in love, and his eagerness to know people that were notorious for anything, were as deep-rooted in his nature as his love of letters and literary distinctions. During his second visit to London he had the supreme happiness to make the acquaintance of Dr Johnson in the back-parlour of Tom Davies's shop in Russell Street (May 16, 1763). The sincerity of the disciple's respect seems to have touched the

master's heart, and the acquaintance quickly ripened into a warm friendship, which stood the strain of many a brutal rebuff on Johnson's part, and was kept in repair by frequent letters on both sides throughout the rest of Johnson's life. A few months later Dr Johnson accompanied Boswell to Harwich, on his journey to study civil law at Utrecht, and parted from him with counsels to be studious and steady, and many expressions of warm affection. At Utrecht Boswell spent one winter between study and dissipation, on an allowance from his father of £240 a year; after which, instead of returning home, he proceeded on a tour through Germany, Switzerland, and Italy, making on the way, with his usual assiduity, the acquaintance of Voltaire and Rousseau. The latter gave him a letter of introduction to Paoli, and to that hero the indefatigable Boswell at once repaired. He was well received by the Corsicans, and for a time played the great Englishman to his heart's content, not forgetting the while to ask Paoli 'a thousand questions with regard to the most minute and private circumstances of his life.' Soon after his return he was admitted advocate (July 1766), and seems to have had some little professional success, and to have employed himself voluntarily at least in the last stages of the famous Douglas cause. His *Account of Corsica* (ed. S. C. Roberts, 1923) appeared early in 1768. Johnson said the Journal was 'in a very high degree delightful and curious,' but the poet Gray, whose eyes were undimmed by the partiality of friendship, called it, in a letter to Horace Walpole, 'a dialogue between a green goose and a hero.' Early in 1767 Boswell waited upon Chatham in Corsican costume to plead for Paoli, and was honoured some time after by a warm letter from the great statesman, which encouraged him in reply to the characteristic temerity of asking, 'Could your lordship find time to honour me now and then with a letter? To correspond with a Paoli and with a Chatham is enough to keep a young man ever ardent in the pursuit of virtuous fame.' From this time Boswell's mind was much taken up with a succession of matrimonial schemes, which ended somewhat prosaically with his marriage, in November 1769, to his cousin, Margaret Montgomery, a prudent and amiable woman, who bore him seven children, and who proved herself a sensible and forgiving wife. On the same day his father married a cousin of his own, to the son's disgust and alarm. The old judge allowed his son £300 a year, and from time to time paid his debts for him, but not without much grumbling and many threats. Boswell never became a prosperous lawyer, and continued to make visits to London almost every year. In April 1773, fortunately for the world, but against the wishes of many of the members, he was elected, through Johnson's influence, a member of the famous Literary Club. Later in the same year occurred the memorable journey to the Hebrides. Neither the old judge nor Boswell's own wife could understand the enthusiasm for the uncouth-looking philosopher, and although the latter was studiously polite, she could not hide from the astute Johnson the fact that he was disliked. In 1775 Boswell began to keep his terms at the Inner Temple, and was ultimately called to the English bar in 1786; in 1776 the Auchinleck property was entailed upon him; and in the August of 1782 he succeeded, on his father's death, to an estate of £1600 a year. His last meeting with Johnson was at a dinner at Sir Joshua Reynolds's early in 1784, the year towards the close of which Johnson died. Croker calculated that Boswell met Johnson in all on 180 days, or 276 including the Scotch tour. Boswell now made some attempts to enter on a political career, for some years entertained hopes from the

patronage of Lord Lonsdale, and could not understand Pitt's 'utter folly' in not seeing the value of 'my popular and pleasant talents'; but his sole reward was the recordership of Carlisle, which he resigned in a year, through resentment of his patron's treatment of him. In 1789 his wife died, and henceforward his drinking habits gained the better of him more completely. But indeed he had been drinking all his days, with fits of repentance and solemn promises of amendment between. From his drunkard's hypochondria and the pressure of difficulties for money he found refuge in the preparation of his life of Johnson, which occupied him several years. Spite of occasional despondency and the pinch of financial difficulty, he refused to part with the copyright, and his confidence was justified. The book appeared in the May of 1791, was received with delight, and sold rapidly. A second edition was issued in July 1793. But his success failed to lift him out of his gloom and intemperance, and his health began to give way. He died in London, after a brief illness, 19th May 1795.

Boswell's *Life of Johnson* is admittedly our greatest biography, and the remarkable merit of the book has led many to wonder how it could possibly have been written by a man of such egregious weakness and vanity as Boswell. Indeed, Macaulay advanced the preposterous paradox that it was because of his unrivalled qualities as a fool that its author had written the best life in existence. The true explanation, however, is that this vanity and folly by no means made up the whole mental equipment of Boswell, and that these unenviable qualities in his character have merely become so conspicuous because he had so much less reticence than ordinary men. The man who could retain the friendship of Samuel Johnson, and who could be described as 'the best travelling companion in the world,' was something more than a parasite and a fool. Nor could the most voracious fool have written such a dexterously artistic book. But it should be remembered that Boswell's Johnson is the real Johnson only so far as Boswell understood the soul of the English moralist; we cannot believe that the biographer realised the deeply religious side of Johnson's nature. The portrait may be true so far as it goes, but for the complete Johnson we must seek and find him in his own works. He gives us the most vivid dramatic pictures by a few simple but subtle strokes; this is not the work of memory nearly so much as of artistic reproduction. This noisy, ugly, vain, foolish, drunken Scottish lawyer and laird, 'the buffoon of genius,' had in him something of the true Shakespearian secret.

The great standard editions of Boswell's great work are those by Napier (1884) and by Dr Brinkbeck Hill (6 vols. 1887), Boswell's letters to his lifelong friend Temple (1856; ed. Secombe, 1908), and *Boswelliana* (1874) by Charles Rogers. The famous essays by Macaulay and Carlyle contradict rather than correct each other; but the latter has much more truth in it than the former. There is a *Life* by Percy Fitzgerald (1891), who in *Boswell's Autobiography* (1912) argues that the *Johnson* is really Boswell's life by Boswell; a book by Leask (1897), one by George Mallory (1912), Professor C. B. Tinker's *Young Boswell* (1922) and edition of his letters (1924). See also the books named at JOHNSON. Sir Walter Raleigh says he was 'a greater man than Macaulay.'

Boswell's eldest son, ALEXANDER, was born at Auchinleck in 1775, and educated along with his younger brother James at Westminster and Oxford. He settled at Auchinleck, and set up here a private press, at which he printed many rare books in early English and Scottish literature. He had all his father's industry and love of letters, and published many volumes of more or less meritorious verse. Already, in 1803, he had printed a volume of vigorous poems in the Ayrshire dialect,

and in 1817 he contributed twelve songs to Thomson's *Select Collection of Original Scottish Airs*, of which 'Good-night, and joy be wi' ye a', 'Jenny's Baubee,' and 'Jenny dang the Weaver,' are still popular. A devoted admirer of Burns, Boswell raised by his exertions £2000 for the monument on the banks of the Doon. He was created a baronet in 1821 for a loyal song, 'Long live George the Fourth.' He died at Balmuto in Fife, 27th March 1822, of a wound received the day before in his duel with James Stuart of Dunearn, who had challenged him as the author of some anonymous political pasquinades.—JAMES BOSWELL, his younger brother, was born in 1778. He early became intimate with Malone, and assisted him in his Shakespeare work. His name is now known chiefly to Shakespeare scholars as the editor of what is known as the third *Variorum Shakespeare* (21 vols. 1821). He died suddenly at his chambers in the Temple, February 24, 1822.

Boswellia, a genus of Burseraceæ, of which the species are still very imperfectly known, although the product of some of them—Olibanum (q.v.), generally believed to have been the Frankincense (q.v.) of the ancients—has long been of considerable commercial importance for the preparation of incense. The most important species appears to be *B. carteri*, but several other species or varieties have been described from the same region (Southern Arabia and Eastern Africa, near Cape Guardafui). *B. thurifera* or *serrata* of Coromandel yields a soft fragrant incense-resin, which is not true olibanum; and the closely allied *B. glabra* also yields a comparatively coarse resin, sometimes used as incense, but also boiled with oil as a substitute for pitch. The Abyssinian *B. papyrifera* (so called from its laminated paper-yielding bast) also yields an olibanum, but it is not collected.

Bosworth, or MARKET BOSWORTH, a small market-town in Leicestershire, 12 miles W. by S. of Leicester. On a moor 2 miles to the south was fought (1485) the battle in which Richard III. was slain, and which terminated the Wars of the Roses. On an elevation, called Crownhill, Lord Stanley placed the crown on the head of the Earl of Richmond, Henry VII. Simpson the mathematician was a native, and Dr Johnson was an usher in the grammar-school.

Bosworth, JOSEPH, D.D., an Anglo-Saxon scholar, was born in Derbyshire, in 1789, and educated at Repton, Aberdeen, and Trinity College, Cambridge. Presented in 1817 to the vicarage of Little Horwood, Buckinghamshire, he devoted all his spare time to literature, and especially to researches in Anglo-Saxon. The result of his labours appeared in his *Elements of Anglo-Saxon Grammar* (1823), and *A Dictionary of the Anglo-Saxon Language* (1838), his *magnum opus*, a new edition of which, by Professor Toller, has been issued from the Clarendon Press since 1882. Bosworth resided as British chaplain in Holland from 1829 to 1840, when he obtained the vicarage of Waithe, in Lincolnshire, in 1837 becoming rector of Water Stratford, Buckinghamshire, and in 1838 professor of Anglo-Saxon at the university of Oxford. He gave £10,000 towards the establishment of a professorship of Anglo-Saxon at Cambridge, having, according to his own statement, realised £18,000 by the sale of his works. He died 27th May 1876.

Bosworth, WILLIAM, poet, was born in 1607 of the family of Bosworth or Boxworth, of Boxworth in Cambridgeshire. Of his life little or nothing is known. He seems to have died in 1650. Next year one R. C. published a volume entitled *The Chast and Lost Lovers lively shadowed in the persons of Arcadius and Sepha*. The contents of this book, one long poem and a few shorter

ones, are said to have been written by Bosworth at the age of nineteen, and there is a hint that more may follow; but no more seems to be extant. Bosworth's poetry is pleasing, not without promise. It follows the older Elizabethan rather than the contemporary manner. See Saintsbury's *Caroline Poets* (fi. 1906).

Böszörmény, two towns of Hungary: (1) Hajdú-Böszörmény, 12 miles NNW. of Debreczen, in a corn and cattle district; pop. 30,000. (2) Bereg-Böszörmény, a small town 33 miles SSE. of Debreczen; pop. 5000.

Bot, Bot-fly, Gad-fly, and Warble-fly, names common to many insects of the family *Cestridae*, the genus *Cestrus* of Linnæus. The name bot is sometimes restricted to the parasitic and destructive larvæ. This appears to have been its original use, the other names being given to the perfect adults, and the name gad-fly often to blood-sucking insects of the very different genus *Tabanus* (q. v.), to which some try to restrict it. The insects of this family are now supposed not to be those which were called *Cestrus* by the ancients, although, like them, extremely troublesome to cattle. They are dipterous (two-winged) insects (see *DIPTERA*), nearly allied to the *Muscides* (House-fly, Flesh-fly, Blow-fly, &c.).

The head is large, and as if blown out; the antennæ are short and spring from deep pits; the proboscis and palps are degenerate; the eyes are small, and there are three eye-spots; the posterior part of the body is rounded; the hindmost legs are often very long. The larvæ have toothed body-rings, and are parasitic in the nose, throat, stomach, or under the skin of mammals, and are unfortunately more familiar than the bee-like adults.

(1) The Horse-bot, or Gad-fly of the Horse (*Gasterophilus*, or *Gastrophilus* or *Cestrus equi*), sometimes also called the *Breeze* and *Horse-bee*, is much less common in Britain than in some parts of the continent of Europe, and occurs chiefly in elevated heathy districts. It is not quite half an inch in length, woolly, with yellowish-gray head, rusty thorax and abdomen, and whitish wings, with brownish-gray spots. The abdomen of the female

Horse Bot-fly:

a, a horse-hair with eggs of bot-fly, b, one egg magnified; c, larva, d, pupa, e, perfect insect female, a little larger than life.

ends in a black horny egg-laying tube. In the later part of summer the female hovers about horses, and deposits her eggs on their hairs, where they remain attached by a glutinous substance, until they, or the larvæ just emerging from them, are licked off by the tongue of the horse, their destined place being its stomach. It is believed that the fly deposits her eggs only on those parts which are accessible to the horse's tongue, seeming to prefer the back of the knee-joint, where they may sometimes be found in hundreds. The larva is yellowish, without feet, short, thick, soft, composed of rings which have a double row of short

teeth surrounding them; it is somewhat sharply pointed at one end—the head; and the mouth is furnished with two hooks, one on each side, for taking hold of the inner coat of the horse's stomach, to which the bot attaches itself, and from which it derives its subsistence, hanging in clusters sometimes of three or four, sometimes of more than one hundred. Here it spends the winter, and in the following summer, when it is about an inch long, it disengages itself, and being carried through the horse's intestines, burrows in the ground, and changes into an oval black pupa with spiny rings, from which, in a few weeks, the perfect insect comes forth. Multitudes, of course, become the prey of birds before they can accomplish their burrowing. It has been disputed whether or not bots are very injurious to horses; and some have with apparent improbability maintained that, when not excessively numerous, their presence is rather beneficial. —The red-tailed Horse-bot (*G. hæmorrhoidalis*), also a British species, deposits its eggs upon the lips of the horse, distressing it very much by the annoyance which it gives in so doing. The larvæ attach themselves chiefly to the surface of the intestine and about the anus of the horse, and sometimes cause an annoying irritation. Linseed-oil is used for their removal. *G. nasalis* also finds its way into the stomach, more frequently the small intestine, of the horse.

(2) The Ox-bot or Warble-fly (*Hypoderma*) causes 'warbles' in cattle. The common English species is *H. lineata*; the common Irish one is *H. bovis*. The handsome bee-like flies are commonest at the height of summer, and, though they do not sting or bite, they cause much excitement among the

Ox Bot-fly:

a, larva, full grown, natural size; b, pupa; c, perfect insect, a little larger than life.

cattle. The females lay their eggs near the head or shoulders, and perhaps exceptionally on the back. It is believed by some that the eggs are usually laid on the back, that the larvæ are hatched there, and that they bore their way directly below the skin of the back, where the warbles mostly occur. The facts seem to indicate a more circuitous path, for the larvæ are found far inside the animal in many places between the gullet and the back. It is likely that the larvæ are licked in by the cattle, as in the case of horse-bots, and that there is a slow internal migration. Eventually, in any case, the larvæ come to rest in abscesses below the skin, each with an air-hole to the surface. In May or June of the next year they wriggle out, and pupate on the ground. The flies emerge in about seven weeks. The damage done by these parasites is threefold: the warbles spoil the hides; the flesh is condemned as 'licked beef'; the cattle go out of condition. As the flies love the sun, it is important that the cattle should have access to shade and water. As a preventive, the hocks, &c., are sometimes dressed with paraffin and the like. The larvæ should be squeezed out and destroyed in spring, or smothered with M'Dougall's smear or greasy matter.

(3) The Sheep-bot (*Cestrus* or *Cephalomyia ovis*) is a much more serious pest than any other British species, and is not infrequently very destructive to

flocks. The insect is smaller than either the ox-bot or horse-bot, is of a yellowish-gray colour, with a large head and yellow face, and is most abundant in damp situations and woody districts. It is to be seen chiefly in the months of June and

Sheep Bot-fly (*Estrus ovis*):

a, larva from above; b and c, the same seen from in front and from behind; d, adult insect.

July. Sheep exhibit great alarm when it approaches them, and seem to seek, by keeping their noses close to the ground, and by incessant motion of their feet, to keep it from entering their nostrils. It is in the nostrils of the sheep that this fly deposits its eggs, and the larvæ, when hatched, make their way into the maxillary and frontal sinuses, feeding upon the juices there, until they are ready to change into the pupa state, in April or May of the following year, when they find their way again through the nostrils to the ground. They seem to cause great irritation in their progress up the nostrils of the sheep, and the poor animals run hither and thither, snorting and in great excitement. 'The common saying, that a whimsical person is *maggoty*, or has got *maggots in his head*, perhaps arose from the freaks the sheep have been observed to exhibit when infested by their bots.' The bots cause considerable irritation in the cavities where they usually fix themselves, and sometimes getting into the brain cause death.—These larvæ move with considerable quickness, holding on by the hooks with which their mouth is furnished, and contracting and elongating the body. It is said that flocks fed where broom is in flower are never infested with them; and when many cases arise in a flock, removal to a dry soil is found particularly advantageous.

These three genera, with their three modes of parasitism, do not complete the list of bot-flies; *Cephenomyia* and *Pharyngomyia* are two others with several species infesting, in their larval state, deer, goats, and other hoofed mammals. Elephants are also afflicted; and *Cuterebra* deposits its eggs under the skin of hares and the like. The eggs of one of the species which attacks the fallow-deer are deposited in the nostrils, and the larvæ make their way in large numbers to a cavity near the pharynx. Reindeer are excessively tormented by these insects, one kind depositing its eggs in their nostrils, and another in their skin; and it is no unfrequent thing for a large part of a flock to be destroyed by them. When feeding where bot-flies are numerous, they are said to keep such watch against them, that they neglect to eat, become emaciated, and often actually perish in consequence. Even human beings are said to be sometimes afflicted by insects of this family. Humboldt saw Indians in South America having the abdomen covered with tumours produced by their larvæ. They touch human life more certainly and disastrously in an indirect way by the injuries they inflict upon stock. Dairy and sheep farmers, and stock-keepers generally, not to speak of leather manufacturers, know well the disastrous work of these bot larvæ. 'The attack of warbles (alone) is now grown to be one causing enormous annual national loss, estimated by practical men at sums from two

million to seven million pounds sterling per annum, at the least, and there is no reason why we should suffer it to go on' (Miss Ormerod).

See Miss Ormerod's works on insect pests, and specifically on the ox bot-fly (1881-94); and Osborn's work (pub. by U.S. Agric. Dept. 1896)

Botallack is the name of a famous mine on the west coast of Cornwall, 8 m. N. of Land's End. The works are on the edge of the cliff: part of the underground workings (abandoned in 1875) extended 2448 feet beneath the sea. The mine was worked as a tin mine in 1721, in 1841 was famous as a very rich copper mine, and has subsequently been wrought for both or for one of those metals.

Botanical Geography. See GEOGRAPHICAL DISTRIBUTION, ECOLOGY.

Botanic Garden. While ordinary gardens are concerned with utility or beauty only, the botanic garden has for its primary aim the promotion of botanical science, and is thus necessarily of comparatively modern origin (see BOTANY). Like the science itself, the botanic garden owes its birth to the needs of pharmacy; thus at the earliest European school of medicine, that of Salerno, we find record in 1309 of the medical garden of *Matthæus Sylvaticus*; while in 1333 a similar garden was established by the Republic of Venice. These private and public examples seem to have been more or less widely followed, yet the botanic garden in the modern sense is usually dated from a private one founded at Padua (between 1525 and 1533), from the public one of Pisa, established by Cosmo de' Medici in 1544, or from that of Padua, which dates from the following year, and was greatly enriched by its founders, the Signiory of Venice. The other great Italian cities soon followed this example, and a botanic garden was also founded at the university of Leyden in 1577, and at the universities of Montpellier, Leipzig, Breslau, and Heidelberg before the end of the century. At Paris, too, a royal garden was founded in 1597, but at first, it is said, only with the petty aim of varying the bouquets worn at court: in 1626, however, its scientific purposes were defined; in 1635 chairs of Botany and Pharmacology were founded, and it soon became famous as the *Jardin des Plantes*. The establishment of physic or botanic gardens continued during the 17th century, and those of Oxford (1632) Chelsea (1677), and Edinburgh (1680) may be particularly noted. A further impetus was given by the popularisation of botany in the last century by Linnæus, and by the consequently increased importance of the subject as a branch of academic education: most European universities, including all German ones, have now their botanic gardens, as well as many purely commercial cities. The leading American universities and cities have also followed suit, the gardens of Philadelphia, New York, Cambridge, and St Louis being well known. Similar institutions, usually of more definitely economic aim, have been founded by the principal governments in their colonial dominions; those of Buitenzorg in Java, of Calcutta, and of Peradeniya in Ceylon, may be mentioned as of special importance. While almost every botanic garden boasts its own peculiar excellence, the comparatively modern establishment of Kew, founded in 1760, is reckoned the largest, richest, and most fully organised (except for teaching purposes) in the world; those of Paris, Berlin, Vienna, and Edinburgh may also be mentioned as each in certain respects claiming in the foremost rank.

The mode of arrangement of botanic gardens varies infinitely in detail, yet more or less faithfully reflects the state of scientific knowledge and of horticultural and general taste at the period

of its foundation or reconstruction; hence a scientific (but not always artistic) advantage of modern gardens. The Linnean system of arrangement has of course been replaced by the Natural, but in expressing this no two gardens agree. In some the principle of arranging plants according to their geographical distribution is also largely followed, while economic or medical interests have had a very variable share. The primeval and convenient separation of plants as trees, shrubs, perennial herbs, and annuals has also to be largely attended to; while the very varied origin of the collection, from all countries and climates, necessitates their disposition as nearly as possible in corresponding artificial climates and soils; and thus not only the rockery and alpine garden, the bog garden, and the pond are required beside the ordinary garden beds, but a series of greenhouses and hot-houses of different temperatures and sizes; the latter culminating in the gigantic palm-house. The best garden may be taken as that which best combines all these advantages, and reconciles them with the respective claims of simplicity and beauty; yet no garden can be considered as complete without its accompanying *hortus siccus* or herbarium, its museum, and its library, as well as its laboratories for research, and its lecture-rooms for teaching. It is concerned with the introduction of new plants and the exportation of others to new countries, and thus requires a colonial and international organisation of exchanges and correspondence. It forms a natural centre for the preparation of scientific travellers and the training of gardeners, arboriculturists, nurserymen, and florists; while it owes services both to medical and general education.

While for the full performance of all these varied functions the resources of a great botanic garden are never too ample, it is important to note in conclusion that many of these purposes, and particularly the educational one, can be largely reached upon an incomparably smaller scale. A 'type botanic garden,' illustrating all the more important natural orders of temperate climates, and therefore containing examples of the majority of the plants most important from the point of view alike of botany and medicine, of history, literature, and economics, can be made at altogether trifling expense, and within the narrowest limits. The establishment of such small popular gardens has been followed by the most beneficial results, and their adoption by public and private schools and other institutions is happily in active progress (see BOTANY). For the literature of botanic gardens, see JACKSON'S *Guide to the Literature of Botany*, pp. 405-453, and thereafter JUST'S *Botanischer Jahresbericht*.

Botanomancy. See DIVINATION.

Botany is that sub-science of biology which has for its special province the phenomena of the vegetable world. Its general origin and rise, its place among the sciences, its progress in morphological and physiological analysis, and its broadest generalisations, have thus been already outlined under BIOLOGY (q.v.); here it remains to give a sketch of the history of the special study of plants, an account of its present state, and an indication of the most direct and profitable way of approaching the subject. From this brief account the reader may therefore pass on the one hand to the major article BIOLOGY, with its subordinate general articles like MORPHOLOGY, PHYSIOLOGY, &c., and on the other to any of the numerous minor articles concerned with the details of the subject.

1. *History of Botany.*—The special history of the science may be very briefly outlined. Aristotle's treatise *On Plants*, if indeed it was Aristotle's, is

lost, but the writings survive of his pupil Theophrastus, who not only describes about 500 plants, but discusses the vegetable world with something of his master's philosophic spirit. The 1st century produced the *Materia Medica* of Dioscorides—in which 600 plants are named, 400 with descriptions—as well as the writings of the elder Pliny, which, however, contain no original matter, but are simply a compilation of literary and popular knowledge, chiefly with reference to practical uses. Although some knowledge of botany must have been conserved in the medical traditions of the following centuries, we hear nothing of botany until the time of Charlemagne, who was a hearty patron of gardening as well as agriculture. The early Greek knowledge of the subject found its way through the Herbal of Avicenna into Western Europe, and it is probably to this transmission that we owe the 13th-century work of Albertus Magnus, although this is a mere worthless commentary upon the classical writers already mentioned. The merit of initiating the independent observation of plants themselves is usually ascribed to Otto Brunfels of Strasburg, whose *Krautbuch* was published in 1537, three years after his death. Similar descriptive efforts followed with increasing rapidity during the remainder of this and the following century, to which period belong many botanists of honourable memory. Among these may be especially named, in Germany, Bock and Fuchs; in Switzerland, Gesner and the brothers Bauhin; in the Netherlands, Dodonæus, Lobel, and Clusius; in France, Ruellius and Delechamps; in England, Turner; and in Italy, Cæsalpinus; while the rate and reality of progress may be judged from the fact that while Brunfels describes only 240 species, Bock has 800, Lobel 2191, and Bauhin (in 1623) 6000 species. Botanical travellers also arose, among whom Clusius in Europe and Albin in the east are especially remembered. Botanic Gardens (q.v.) next were founded, classificatory attempts were made with more and more frequency, and the advent of Linnæus was thus fully prepared for. The later portion of the 17th and beginning of the 18th century is also memorable for the fruitful application of the microscope to the study of plants by Malpighi (q.v.), whose discoveries were continued and extended by his English exponent Grew, as well as by the indefatigable enthusiasm and industry of Leeuwenhoek. The study of cryptogamic plants was thus rendered possible, and its initiation is ascribed to the labours of Micheli and Dillenius during the second quarter of the 18th century. The rise of Vegetable Physiology (q.v.) is also dated from the classic observations (1727) of Stephen Hales upon the movement and pressure of the sap.

The descriptive botanist still necessarily occupied by far the foremost place, especially as the progress of botanical travel was now passing the limits of Europe to bring home an indefinite variety of plant marvels from all the most distant countries. Many stately monographs thus date from the same pre-Linnean period, while the replacement of the crude and empirical classifications due to Cæsalpinus and other writers of the 16th century became increasingly hopeful as well as urgent. The classifications proposed by Moisson, Ray, and Tournefort were especially of service, and will be considered at VEGETABLE KINGDOM. Under this head must also be discussed the epoch-making *Systema Naturæ* of Linnæus, as well as the various phases of that necessary replacement of his artificial method of larger grouping which has been in progress during the past hundred years. Although the foundation of the 'Natural System' is with

substantial justice assigned to the two De Jussieus (uncle and nephew), it must also be remembered that its essential principle—that affinities are to be determined not by any single character, but by the sum of all—had been more or less familiar to many of the earlier botanists, particularly to Ray, as certainly also to Linnæus himself. He in fact proposed his artificial system avowedly as provisional; and the blame of its obstinate and bigoted retention for well-nigh two generations after Linnæus and the elder De Jussieu had departed, must thus, as in so many other historic cases, be ascribed, not to the purpose of the master, but to the blind and indiscriminating reverence of his disciples in adhering to the letter of his writings at the expense of their general aim and spirit.

The story of this long and laborious indexing of the book of nature is an interesting tale. The wanderings of Clusius were repeated and outdone by the immediate scholars of Linnæus, a generation later by Humboldt, and again by the younger Hooker, with whom a new record of eminent collectors begins; and the story has in it an element of epic breadth, as becomes what is indeed the modern re-search after the golden apples. Nor should the patient complementary systematic toil, of which the colossal *Prodromus Systematis Naturalis*, the monument of three generations of De Candolles (Geneva, 20 vols. 1818–73), is only the central work, pass without recognition.

But it is a less favourable aspect of the progress of botany which forces itself on the student. From the petrifying predominance of letter over spirit, no science has indeed been wholly exempt. Yet happily, for the past century at least, no department of knowledge save botany has ever fallen into such utter intellectual torpor, lain in it so long, nay, indeed, even now escaped from it so incompletely. It was much certainly to have done with commentaries upon Dioscorides and Pliny, and again begun after an interregnum of fifty generations to gather fresh flowers and look at them in themselves; still, this return to nature was far less thorough than it seemed. For although the old herbalist's reference-book of dried simples gathered from the fields and woods around his town was growing into a vast herbarium of all the world, and although he had been suddenly raised into a position of high academic honour and influence, the unnoticed drawbacks of such apparently complete scientific success were neither few nor small. The best botanist was thus he who had described most plants and had accumulated the richest herbarium; but the art of describing plants, once clearly learned, became a mechanical routine, a mere Latin clerkship. The inventory done, the interest of the consignment of new plants was exhausted, or thereafter oscillated between the petty pride of priority and possession, and the exercise of the surviving commercial passions in incessant barter. In their new-won academic seats, the systematic botanists in fact speedily absorbed all the vices of the old-world pedantry around them. First, the simple descriptive language of Linnæus was elaborated into a barbarous terminology which he would have been the first to denounce; and the concrete teaching of the facts of botany became more and more pushed aside. The whole course of degeneration was in fact a curiously perfect outcome and reflection of the established course of general education, in which the abstractions of grammar, at first admitted as a preliminary aid to the study of literature, had finally come to exclude that study for the majority of learners altogether. Nor did these vices by any means wholly end with the victory of the Natural System; some residue of them is inseparable from all study of the subject on a purely morphological

basis. Linnæus and De Jussieu alike committed themselves to this, and that necessarily so far as their immediate problem was concerned (see BIOLOGY, § 3). They failed sufficiently to realise, or at anyrate to point out to their successors, what an abstraction from the realities of the living world is involved in looking at the plant from a primarily morphological point of view—in regarding it as a fixed and empirical phenomenon of pure form, which may be analysed and compared, named and classified, but admits of nothing more. Hence, while their followers rightly continued to avail themselves of this abstraction, which they found to yield a wealth of detailed results, they became unconsciously enslaved by it, and henceforth mistook for the sole method of botany what was really no more than the necessary artifice of its morphological department. They even unhappily lost sight of the central problem of their subject, that of interpreting the plant as a changing manifestation of life. It was much indeed to pass from the counting of the reproductive organs only with the Linnean systematist to that comparison and scrutiny of all which was initiated by De Jussieu, and hence to extend our knowledge to the cryptogamic world; and much also to discern with Goethe and succeeding morphologists the deep unity of principle which underlies the widest apparent varieties of form, and which has enabled us to reduce all organs to the simple categories of root, stem, leaf, and trichome or hair, and even to analyse these into their component tissues—epidermic, fundamental, and fibro-vascular; and finally most of all with the embryologist to describe all these forms as the final phases of a process of continuous development from unicellular to multicellular, general to special, simple to complex. In this way we at length reach a morphological conception of even the evolution of organic beings, as a kind of phantasmagoria in which the empirically known forms undergo a broadly similar individual and racial development, and in which individuals and species alike are constantly replacing or being replaced by others. Yet so long as our original standpoint is unaltered, our botany is one-sided; nay, our knowledge is not yet truly biological at all, for we are forgetting that it is the phenomenon of life which is the *differentia* of the science.

Here, then, it is that the real understanding of the subject must begin; our essential problem is to understand the life of the plant, to comprehend the sum of its functions, to answer first of all the questions natural to every healthy mind, whether child's or beginner's, and inquire what is the use to the plant of its root, stem, and leaves, its flower and fruit. To answer these questions rightly involves indeed at once all the preceding morphological inquiries, yet now in a new spirit; for these parts are no longer to be thought of as forms to be discussed by themselves, but as the result of the adaptations in the past and the present of the living being to its surroundings, of organism to environment, inside to outside. Some of these adaptations are active, enabling the plant to utilise its favourable conditions; others passive, to resist its unfavourable ones. Hence, whether we seek rationally to comprehend the history of botany, or its present state, or profitably to undertake its study, the physiological standpoint is the essential one. While recognising the importance and legitimacy of morphological inquiries, of description of general form, or of the study of organs, tissues, cells, and protoplasm (see BIOLOGY, § 3), we have distinctly to correlate and subordinate this sub-science to the physiological interpretation the mind is primarily seeking. Our biological science is a concrete and

dynamic, not an abstract and static one; its highest ideal is a synthetic view of functions and forms, and to this the analysis must be subservient.

Yet in the pre-Linnean, Linnean, and even post-Linnean period, the morphologists predominated almost exclusively: the discovery of the sexes of plants had indeed been made, but lay almost unutilised. Kölreuter might indeed experiment on the fertilisation of plants, and Sprengel exultantly publish his *Secret of Nature Discovered*, but these admirable labours were absolutely ignored until their repetition a century later by Darwin. The physiological investigations of Hales were similarly left uncontinued until comparatively recent times; and the yet more important line of discovery as to the function of leaves and their relation to the atmosphere initiated by Bonnet, Ingenhousz, and Senebier a century ago, seems to have met with similar indifference so far as professed botanists were concerned, although their transcendent physiological, chemical, and agricultural interest secured their continuance after Priestley by chemists like T. de Saussure and Boussingault.

The tendency towards recovery from this dryadust character of the science can of course be traced in the writings of many botanists, especially after the time of Goethe. From faults of this order the 'Naturphilosophie,' of which Oken (q.v.) was the leading representative, certainly escaped. The peculiar extravagances of his speculations can only be explained as the violent reaction of an original but inaccurate mind of strong physiological bias, and his conspicuous failure to make any substantial contribution to science, and the natural repugnance of all the more exact although narrower minds around him to his baseless hypotheses, had a most disastrous effect in discouraging and postponing any trespass beyond the conventional lines of labour, or any progress to a fresher and more vital point of view. The developmental and physiological attitude was, however, much more effectively reasserted by Schleiden, whose *Principles of Botany* (1846) is full of a trenchant and perverid criticism, in spirit and expression often curiously suggestive of Carlyle. His views gained great weight from his high histological and physiological position as the founder of the cell theory; and in no small measure through him progress in Germany, henceforth became so rapid as soon to place that country in the van instead of the rear. Not only have the labours of cryptogamists like Hofmeister, Cohn, and De Bary been of wide influence, but great schools have arisen of vegetable physiology—e.g. those of Sachs and Schwendener. Since 1859, the commanding influence of Darwin has been steadily saturating botanical thought. It is to him (see BIOLOGY) that we owe the authoritative accomplishment of the change from the primarily analytic and static, or morphological view of the plant-world, to the dynamic or physiological one. Here, with the science centred no longer upon the herbarium specimen, but once more, as it were, upon the living dryad, this retrospective sketch of the progress of botany may fitly conclude, leaving further details to be sought for in the articles devoted to the lives of different botanists, and to special departments of the subject.

2. *Present State of the Science.*—While more and more influenced by the historic movement above outlined, the present state of botanical research presents many examples of work in all departments and aspects of the subject. Whole battalions of workers are busy upon each successively deepening plane of analysis (see BIOLOGY, § 3). Thus, although the age of great travellers is necessarily ended, the explorer still finds abundant gleanings in many parts of the world, and the

minor fungi and algae will also long furnish an especially fertile field of systematic labour. The essential problems of the morphology of the higher plants may be said to be mainly solved; and though those presented by cryptogamic plants are less understood, the splendid generalisation which unifies the cryptogamic and phanerogamic plants as members of a single series must always remain the backbone of the subject. As respects tissue and cell, the progress of microscopic investigation is still yielding results of the highest importance, while the study of protoplasm is also rewarding an increasing number of workers. Physiology, as we have seen, is steadily acquiring its due predominance; indeed, the abundance of workers and of results demands a separate discussion. Here we may merely note how these workers fall into two main schools, one, long represented by Sachs, studying protoplasm and cell, tissue and organ, by help of all the resources of chemistry and physics; the other, of which Darwin was the head, concerned with the detailed interpretation of the adaptation of the plant to its mode of life, and with the history of its evolution. In this relation the studies of the botanical geographer and the palæontologist are also of special importance; and it is naturally from this evolutionary school that the synthetic impulse chiefly emanates which is now beginning to be felt in all departments.

The voluminous literature embodying the results of all these labours is published sometimes as of old in separate volumes; more frequently in the proceedings of learned societies; but oftener in special journals too numerous for mention, of which the *Botanische Zeitung* and *Bot. Anzeiger* may occupy a foremost place. Of this copious outflow of new published matter a partial idea can be obtained from such abstracts of selected papers as are published in the *Journal of the Royal Microscopical Society*; while the entire literature of each year is indexed and summarised in the volume of the *Botanischer Jahresbericht*. The most ready and convenient method both of obtaining a general idea of the literature of the subject, and of threading one's way into any of its minor mazes, is by help of Jackson's *Guide to the Literature of Botany* (Index Soc., 1880), and thence by the above named.

3. *Method of Botanical Study.*—While the professed student of botany cannot avoid embarking upon this sea of literature, he can now happily obtain such more or less adequate section charts as are afforded by the manuals of Vegetable Physiology, of the Vegetable Kingdom, or of such special groups as Fungi and Bacteria, which the rising synthetic spirit of recent years has fairly commenced to supply. The beginner, however, demands a single introductory text-book; and simple as his demand may seem, it is generally the most difficult to supply. At best, such manuals can never replace good practical oral teaching, or keep abreast of the most recent developments of knowledge. Many of the existing manuals are even positively mischievous. Survivals of one or other of the earlier phases of the science, they land the student at the very outset at some long-past stage of its progress, where he is only too likely permanently to remain. And when not altogether pre-physiological and pre-evolutionary, they are apt to introduce the student to evolution and physiology at the conclusion of his course of study, instead of training him from the outset to grasp and interpret everything by their aid.

The worst of these many introductory manuals are mere crowded morphological compilations, all more or less antiquated, if not inaccurate. Even when they do not confuse and repel the student from the outset, they are wont to reverse that fundamental principle of progress from the known

towards the unknown which underlies all effective research. To the beginner the cell and protoplasm are not the fundamental units that they are to the teacher; they are precisely the things which lie furthest from his experience, and are only intelligible as the ultimate results of a long process of analysis (cf. BIOLOGY, § 3). Most manuals still retain these grammarian's vices more or less completely; Sachs's long serviceable *Text-book* was no exception. A partial transition is afforded by the mode of teaching, and series of manuals, of which Huxley and Martin's well-known *Elementary Biology* is the type. Here, although the attractive but illusory simplicity of proceeding from the solitary cell towards the cell-complex presented by the higher plants is retained, the steps are worked out concretely in the laboratory by the student for himself. Yet this utter change of the field of experience, or at least its sudden narrowing and deepening to that of the microscope, is not found in practice to be widely satisfactory or attractive to the student; for it is with the changeful carpet of the woods and fields, and its world-summary in the botanic garden, that most of the problems of the science and of its general interest alike for ever lie. With child and herbalist the student must begin in the fields, must learn on the one hand to observe and delight in the varied life of plants, and on the other to collect and name and analyse its forms. His studies begin with the buttercup, not with the amoeba; hence should be mentioned Oliver's small manual of *Elementary Botany* (1st ed. 1863), in which we have some record of the village-school teaching of Henslow, the botanist to whom Darwin was wont gratefully to ascribe the first scientific impulse of his life. Even in the best of such books the morphological bias usually remains; and hence it is that the majority of beginners soon instinctively abandon the whole subject as 'dry,' while the minority tend to become, with too many field naturalists, mere unthinking herborisers, and as Schleiden was wont to bewail, become intellectually lost and smothered amid accumulations of mere unused 'hay.' When this tendency is guarded against, however, a *flora* is invaluable; while even the worst text-book may be helpful as a work of reference. Among relatively good manuals may be mentioned those of Gray, Van Tieghem, Sachs, Strasburger, the last for choice.

Is there then no way of escape from this perpetual tendency to the desiccation alike of the matter and of the spirit of the science? Assuredly; it is simply that while we have indeed to collect, and name, and analyse in death, these are not ends in themselves, but simply means towards widening and deepening the continuance of that observant delight in the sum of living things with which our interest surely began. In a word, the highest modern botany neither harvests plants with the herbalist, nor picks them to pieces with the child, but finds alike its rise and climax in watching the blossoms open and the bees come and go. The pedigree of the science is only on one side from the herbals of Dioscorides and Brunfels to the system of Linnaeus or Jussieu; the other and nobler line rises in Virgil's song of living nature, runs through the keen yet simple records of naturalists like those of Selborne and Walden, and culminates in the monumental volumes of the greater naturalist of Down. It is in the school, or rather garden, of Darwin, viewed both as the last of the old-world naturalists and as the first of evolutionists and physiologists, that our modern 'introduction to botany' must begin; studies in the herbarium of the systematist and the special laboratories of the physiologist, anatomist, and microscopist may follow thereafter as occasion requires. For the age of mere analysis, guided only by the love

of incessant novelty, or even by that of unity amid details, is ending; the student may now approach the science in a new spirit, since he can interpret its literature as but the incipient record of that vast drama of the evolution of life, at which it is his rare good fortune to be an awakening spectator.

Avoiding at the outset all terminology, and even all anatomy as well, the beginner cannot do better than attempt some actual observation of plants in their living relations, as of flowers to insects, and the like, and read some of the abundant and popular literature of such subjects. On if his curiosity need awakening, it cannot fail to be stimulated by such a tale of living wonders as Darwin's classic *Insectivorous Plants*. His introduction to the subject through such characteristically animal attributes as digestion, movement, and sensitiveness, has the peculiar advantage of soon leading him to see how these are only the more conspicuous developments of functions widely diffused throughout the whole vegetable world, and inherent in all living matter alike. When these apparent anomalies are once understood as illustrations of the thorough unity of organic nature, he may still follow the course of Darwin's own mind and work in his *Climbing Plants and Movement in Plants*, and see how the wonderful sensitive-plant shows only a development of the 'sleep movements' of every cabbage-seedling, or how climbing and twining have been generalised with all other plant-movements as mere developments of the gentle *circumnutation* of every growing point. This is indeed questioned in detail, yet the fundamental lesson will have been learned, and the conventional Linnean and utilitarian conception of the plant, as a mere specimen, useful or otherwise, will have been clearly replaced by the physiological one.

But plants not only move but grow: they have relations to soil and atmosphere; they thirstily absorb and copiously transpire. Here we have to inquire into the chemical composition of plants, to investigate their ash and their organic constituents, and to inquire how these were respectively obtained (see VEGETABLE CHEMISTRY, SOILS, &c.). The germinating plant and the blossom are manifestly breathing, sometimes as warmly as an animal (see ANIMAL HEAT); yet this, again, is no anomaly, for all living matter must oxidise and burn away. The functions of the leaf next engage us. We find that given green colouring matter (see CHLOROPHYLL), it can seize the energy of sunlight, reduce the carbonic anhydride of respiratory waste, and pour back oxygen into the atmosphere. Leaving for the present the problematical details of this process, but noting the perfect 'balance of nature' between vegetable and animal life, which is the general result, we must pass to the structure of leaves, and study this first in the light of these essential functions, thence working back to the structure of stem and root; and next, in so far as modified in relation to special functions and environment—e.g. floating or submerged, stoing or protective from climate or enemies, insect-catching or attracting, and so on; while leaf-arrangement and bud-packing may here be appropriately considered.

But leaves are not merely vegetative, nor even confined to the purposes of the individual life; they became modified in relation to that of the species, and so we have ultimately *flowers*. This subordination of vegetative life powerfully affects the mode of branching, and gives us the phenomena of inflorescence, while in the individual flowers we have to note the forms and uses of all the separate parts—(1) accessory (sepals, petals), and (2) essential (stamens, carpels). We study the adaptation of all these (α) to the collective

and general function of (cross) fertilisation, and (b) to their respective special functions—(1) protection from climate and enemies, attractive, mechanical; (2) reproductive. The deep modification of floral types in relation to fertilisation by insects or by the wind, as of the lily type towards orchids on one hand, and grasses on the other, next demands notice; and the corresponding utility of floral details—e.g. position and shape of parts, colours, markings, and perfume—may be exquisitely traced.

In the same way, the mature ovary or *fruit* opens up a new wealth of interest; and its adaptations must be traced for (1) protecting the seed from climate and enemies; (2) dispersion of seed—(a) passive, by aid of wind, water, or animals; (b) active, by scattering or planting the seed. Finally, the mature ovule or *seed* rewards attention: its contained embryo has special protection from climate and enemies, its external 'albumen' or its internal store is an accumulated capital for its start in the struggle for existence; and this process of germination has again countless points of interest.

Having in this way gone through the general physiology of the plant, we must not only sum these up into a complete notion of our plants, which we are no longer in danger of thinking of as mere names or specimens, but as varied life-histories. Then, remembering that these are but the individuals of the larger drama, we learn to read some of the complex relations of living beings; to see their incessant individual and interspecific struggle for existence, yet also their increasingly important relations of interdependence.

But this wealth of interesting and varied knowledge, this complex lore of life, encourages us towards a wider and wider acquaintance with the flora, which now promises not merely new specimens for our collection, but an unknown wealth of new knowledge, we may almost say a multitude of strange individual biographies. Yet our observation, to be profitable, must be orderly and detailed; descriptions must be given; and these accurate and exhaustive, yet of tersest, as it were telegraphic brevity. As specimens and descriptions multiply, indexing and nomenclature become indispensable; and thus, at this point, we need help from, and are therefore ready to appreciate, the labours of Linnaeus and the whole systematic school. The conceptions of species and genus, and the modes of arranging these into larger groups, are thus no longer the arid abstractions they necessarily seemed before the intellectual need had arisen, but are now indispensable aids; while classification is no longer viewed as an arbitrary jargon only to be learned by rote, but as a provisional attempt towards the rational statement of the actual likenesses and differences between kindred forms, and towards the estimation of their relative importance. See BIOLOGY, § 2.

But since our systematic studies have now brought us face to face with the quarter of a million or more species of the modern herbarium, we require a botanic garden to illustrate a selection of these, nay, a smaller 'type botanic garden' as a key to this again. The phanerogamic series, and in some measure also the cryptogamic orders also, thus commence to lie more clearly before us. Finally, some knowledge of the distribution of the vegetable kingdom in space and time is here seen to be reasonable, and therefore interesting.

Our attempts at classification—at discerning the degrees of likeness—compel a detailed comparison of stems and roots, of leaves and flowers, and this often leads to a difficulty which long perplexed the botanist as well as the zoologist. Obvious and superficial resemblances due to

similarity of environment and function are seen to overlie irreconcilable differences of internal structure or principle; while conversely, some given structural principle becomes modified in the most widely different ways for function and environment. This at first led to mere confusion, but the patient and critical researches of the past generation have clearly distinguished between physiological and morphological resemblance (see MORPHOLOGY); while, finally, the study of individual development and racial evolution enable us to interpret these apparently fundamental and often functionless morphological characters as the residual traces of what were once themselves physiological adaptations in their turn; thus finally demonstrating that ultimate subordination of morphology to physiology which has already been so frequently pointed out. Within its minor province, however, which we have now fairly reached, the study of pure morphology must be abstracted from physiological considerations, and thus yields a series of generalisations of an intellectual simplicity and beauty analogous to those of the crystallographers. The utmost varieties of form in stem and root are generalised into the conceptions of ascending and descending *axes*; similarly, disregarding shapes and uses, we have bulb-scales, bud-scales, foliage-leaves, and bracts all generalised with sepals, petals, stamens and carpels as *appendages*. Conversely, the plant thus reduced to axis and appendages may be gradually modelled back into the essential types of the various natural orders.

Next, tissues and cells need consideration from the same strictly morphological standpoint, apart from use. Axis and appendages are thus reduced to their constituent systems of tissues—epidermic, fundamental, and fibro-vascular—and these may be either modelled in thought into the many varieties of tissue, of which these furnish the common materials, or traced back to the primeval embryonic tissue from which they are themselves differentiated. This, again, is found to have arisen from the multiplication and differentiation of a single embryonic cell, the (fertilised) plant-egg. And in this way the full magnitude and beauty of Schleiden's deep generalisation of ultimate unity of vegetable composition, which we call the cell theory, becomes manifest when we have similarly worked towards it, and, as it were, rediscovered it for ourselves (see CELL). From this to protoplasm, and thence to the attempt to return along that return wave of progress from simple cell to cell-aggregate and cell-complex, with which, as we have seen, so many manuals attempt to start, is an easy step. Such treatises may now profitably be employed; and we may, as it were, proceed to build up the living world afresh. We thus return once more to the actual living plant with which we started, yet rich in the results of our prolonged analysis. We know the process of development, the facts of structure, and their relation to function; hence the plant, as it were, is transparent to the intellectual eye, and our final mental image of it is something wholly different from the shrivelled index-mummy of an earlier but aberrant botanical school; it is a *working thought-model* which not only develops under the mental eye from unicellular simplicity to ultimate individual form and complexity, but in which all that is known of the details of structure and processes of life can be summoned up and watched at will, and of which the very incompleteness furnishes a perpetual suggestion and impulse to new research.

Although the processes of physiology and development have thus been kept in prominence from the outset, the cognate question of the origin of plants still remains for discussion. The history of the

conception of organic evolution, and the evidences of its actual occurrence, have yet to be set forth; while, if evolution has actually taken place, its rationale still demands explanation. The various hypotheses dealing with this, more especially the current one of natural selection, have thus to be considered; but the problem of variation demands a deeper treatment, of which the essential results have been already indicated under BIOLOGY (§ 6). In any case, so much is clear that our studies culminate in the perception of the vegetable kingdom as a genealogical tree. Our ultimate thought-model is thus 'the great tree of life, which fills with its dead and broken branches the crust of the earth, and covers the surface with its ever-branching and beautiful ramifications.' The problem of accounting for this incessant branching, of determining the law of this beautiful ramification, may therefore be postponed to EVOLUTION.

4. *Botany in Education.*—The place of botany in medical education is historically due to its fundamental relation to *materia medica*, and hence, since pharmacy is becoming completely distinguished from medicine, the teaching of botany is being abandoned in some medical schools. Yet its claims reappear in a far stronger way when it is considered as a preparation in elementary biology. For although the student of medicine may not unjustifiably care little for the collection or dissection of plants, viewed as an end in themselves, he can never dispense with that training in reading the processes of organic life which is afforded by these their simplest manifestations.

As a subject of general education, too, the importance of botany has long been recognised, and now that the dry-as-dust teaching of the subject is being superseded by a more living and interesting method, its re-adoption into the curriculum both of schools and colleges is in progress, and the botanic garden is becoming a familiar adjunct of the school. At any rate so far as observing goes, the study of botany may more effectively be commenced in childhood than in later life, while initial discipline in drawing, in manipulation, and in the accurate use of language, may all be profitably associated with it. And if it be admitted that for the study of the social sciences preliminary biological studies are requisite, it is in obtaining some concrete acquaintance with the facts of botany that such preparation most conveniently begins.

Botany Bay, a shallow inlet in the coast of New South Wales, 5 miles S. of Sydney, discovered by Cook on his first voyage in 1770, and named by him from the great number of new plants in its vicinity. The spot where Cook landed, on the south shore, is now marked by a monument. Though the first settlers refused to land there, preferring the safer anchorage and better water-supply of Sydney Cove in Port Jackson, the name long continued to be the popular designation, not merely of this convict settlement, but of the Australian convict settlements generally.

The north-eastern and southern shores are still remarkable for the variety and beauty of the flowering shrubs and plants with which they are covered. Otherwise the bay is bordered by a ring of Sydney suburbs, mainly residential, though the northern suburb, which still retains the name Botany, includes many factories.

Both, ANDREAS (1609–50) and JAN (1610–56), painter brothers, were born at Utrecht. Jan painted landscapes in the style of Claude, while Andreas filled in the figures skilfully.

Botha, LOUIS (1863–1919), born near Vryheid, in the Transvaal, was member for his district in the first Volksraad, became a veld-cornet at the outbreak of the war of 1899–1902, and after the death of Joubert was commander-in-chief of the Boer forces, showing exceptional military capacity. A member of the Privy-council, he became prime-minister of the Transvaal colony in 1907, and of the Union of South Africa in 1910, having won the respect and confidence of the opposing interests by his transparent honesty and zeal for the well-being of all sections of South Africans. While still premier he commanded the Union forces in South-west Africa (1914–15), and received the surrender of the German army. See *Life* by Earl Buxton (1924).

Bothie, specifically a barely furnished, generally uncomfortable habitation for farm-servants, mainly in the north-eastern counties of Scotland; situated either under the same roof as the stable, or oftener at a short distance from the steading. While the cubic contents are invariably disproportionate to the number of inmates, the furnishings are of an uninviting, sometimes actually repulsive character. One long, roughly manufactured table, a few long stools, a chair or two, a number of victual bunks, a few wooden caps or bowls, and a pot or two, constitute the bulk of the fittings. The inhabitants are generally unmarried men, who frequently have their own food to prepare. Some of the larger farmers provide a woman for cooking and cleaning the bothie. The bothie system can only be defended as under present circumstances a necessary evil. With the increase of farm-cottages, and under the pressure of public opinion and the growing desire for social elevation, the evil is diminishing, and will, there is reason to hope, be entirely abolished.

Bothnia, the name formerly given to a country of Northern Europe, extending along the east and west shores of the Gulf of Bothnia, the eastern portion now being comprised in Finland, and the western forming part of the Swedish province of Norrland.

The GULF OF BOTHNIA is that part of the Baltic Sea (q.v.) which lies to the north of Åland Islands, having on its eastern shore Finland, on the western and northern Sweden, including Lapland. It extends from 60° to 66° N. lat. and 17° to 25° 35' E. long., its greatest length being 415 miles, and its average breadth 100 miles. Its depth varies from 20 to 50 fathoms, but both along its shores and in the middle are many small islands, sand-banks, rocks, and cliffs, called *skæers*, which render the navigation difficult. It has many good harbours, and from Hudiksvall, Sundsvall, and other ports, timber is largely exported. The rivers which fall into this gulf, both from Sweden and Finland, are numerous; in the upper part of the gulf the alluvial deposits from these have caused the land to extend; in the extreme south-west, on the contrary, the land has apparently been sinking. The waters of the gulf are but slightly salt when the river-flow is greatest; but much more so in winter when the streams are frozen. In winter it is usually so hard frozen that it can be crossed by sledges.

Bothriocephalus (Gr. *bothron*, 'a little pit,' and *cephalē*, 'the head'), a flat parasitic worm allied to the tapeworm (*Tænia*), in the class Cestoda. In its adult stage it is chiefly found in man and dogs,

Bothriocephalus.

and is common in some parts of Europe, such as Western Switzerland, Northern and North-western Russia, Sweden, &c. The adult form consists of a small 'head' without hooks, but with two spindle-shaped lateral suckers, and of a long chain of joints budded off from the attached region. The joints are at first very slender, but gradually increase in length and breadth (the latter always the greater), and become at a certain distance from the head sexually mature 'individuals.' The joints differ conspicuously from those of the common tapeworm in the position of the genital apertures on the flat surface, and also in this, that they are not liberated from the host individually, but in stretches of a few at a time. The total chain may attain the prodigious length of 5 to 10 yards.

The life-history of the common *Bothriocephalus* of

man (*B. latus*) cannot yet be said to be fully known with certainty. The embryo which escapes from the eggs of the ripe expelled joints (*proglottides*) differs from that of the *Tænia* in being ciliated and devoid of hooks. It is free-swimming, and passes, according to Braun, into a fresh-water fish—Pike (*Esox*) or Burbot (*Lota vulgaris*). There it becomes the usual asexual bladder-worm, after it has passed from the gut into the muscle of the fish. When the fish is eaten raw or half-cooked by dog or man, the bladder-worm becomes the 'head' of the *Bothriocephalus*, and attaching itself to the intestine, buds off the long chain of sexual individuals or joints. These are liberated as they ripen, and so the vicious circle is complete. *B. cordatus* is another not uncommon species found in fish-eating animals and occasionally in man. There are numerous species, some of which occur in birds. *Bothriocephalus* is not so firmly attached to its host as *Tænia* usually is, and thus admits more readily of expulsion by purgatives and similar expedients. An obvious preventive precaution for man is to see that the fish (*Esox* and *Lota*) be well cooked. See CESTOID WORMS, PARASITIC ANIMALS, TAPEWORM; and Leuckart's *Parasites of Man*.

Bothwell, a village of Lanarkshire, on the right bank of the Clyde, 8 miles SE. of Glasgow. The parish church includes the choir of the old collegiate church (1398; restored 1898-99). The river is crossed here by Bothwell Brig, the scene of Monmouth's bloody defeat of the Covenanters in 1679. A mile from the village are the stately ruins of Bothwell Castle, at whose base the Clyde washes the fair scenery of 'Bothwell Bank,' famous for centuries in Scottish song. Held before that by Olifards and Murrays, Bothwell Castle was possessed by the Douglasses from 1365 till 1455; and to them it reverted in 1492, being now owned by their representative, the Earl of Home. Thus, contrary to Professor Schiern's statement, the infamous Earl of Bothwell had no personal connection with the castle, as neither had his nephew, Francis

Stewart (circa 1563-1624), who in 1576 was created Earl of Bothwell, and who figures in history through his daring attempts to obtain possession of the person of James VI. Bothwellhaugh, about 2 miles ESE., gave designation to James Hamilton, assassin of the Regent Moray. Joanna Baillie was a native of Bothwell. Population, 4000. See Sir W. Fraser's *Douglas Book* (4 vols. 1885).

Bothwell, JAMES HEPBURN, EARL OF, born in 1536 or 1537, received an ill training at Spynie Castle under his grand-uncle, Bishop Patrick Hepburn of Moray, and in 1556 succeeded his father as fourth earl and as hereditary Lord High Admiral. One of the greatest nobles in Scotland, he professed adherence to the Reformation, but stood staunchly by Mary of Guise, the Queen-regent, who in 1558 made him Warden of the Border Marches, and in 1560 sent him on a mission to France. Then it was that he first saw Queen Mary, and then that Throckmorton described him to Elizabeth as 'a glorious, rash, and hazardous young man, one whom his adversaries should have an eye to.' In 1561, shortly after her landing at Leith, Mary made him a privy-councillor; but his own turbulence and Murray's jealousy made the next three years of his life a period of captivity or exile—captivity first at Edinburgh Castle, and then for more than a twelvemonth in England. Not till her marriage with Darnley did Mary recall him from France; but, on 20th September 1565, she restored him to all his dignities; and five months later he married at Holyrood, with Protestant rites, the Catholic sister of the Earl of Huntly. By hostile accounts, he had ere this had many mistresses, and was addicted to far fouler vices. The hurried events of the next sixteen months must be told in full in our life of Queen Mary—the murder of Rizzio by Darnley (9th March 1566), the birth of James VI. (19th June), Bothwell's appointment as keeper of Dunbar, Mary's visit to him at Hermitage Castle, where he was lying sore wounded by the outlaw Jock Elliot (16th October), Darnley's murder by Bothwell (9th February 1567), the mock trial and acquittal (12th April), Mary's abduction to Dunbar (23d April), Bothwell's divorce (3d and 7th May), his elevation to the dukedom of Orkney (12th May), his marriage to Mary (15th May), and the last parting at Carberry Hill (15th June). On the 27th he sailed from Dunbar, and after brief visits to the Earl of Huntly and to Spynie Castle, passed on to Orkney and Shetland. Narrowly escaping a squadron sent in pursuit, and driven by a storm over to Norway, on 2d September he was brought by a Danish warship into Bergen, and detained as having no passport. He never regained his freedom, but from January 1568 was imprisoned at Malmø, and from June 1573, more rigorously, at Dragsholm in Zealand, where he seems to have gone mad before his death, on 14th April 1578. His Declaration, or so-called 'Testament,' acquitting Mary of all share in Darnley's murder, must, if genuine, have been made before October 1569, but is probably a forgery. See his Life by Professor Schiern (Danish, 1863; 2d ed. 1875; Eng. trans. by the Rev. D. Berry, 1880).

Botocudos, the most barbarous of the Indian tribes of Brazil, inhabiting the East Coast range, between the Rio Pardo and the Rio Doce. They are of middle height, sturdily built, and have small hands and feet; their features are strongly marked, with broad cheek-bones, and repulsively thick lips and nose, redeemed by white, regular teeth, and sparkling black eyes. They are rather yellow than copper-coloured, and their hair, of which only a tuft is worn on the smooth-shaven head, is not quite black. Their name is derived from the

Portuguese *botoque*, 'bung-hole,' with reference to their under-lip pierced to hold a disc of wood, sometimes 3½ inches in diameter. They generally go quite naked, and have no fixed settlements, but in their wanderings through the country keep the routes open by means of bridges of creepers woven into ropes. Their food includes anything not absolutely poisonous that will stay their hunger; even soft earth is eaten. Their speech is entirely distinct from that of the other Indian nations; they have no religion, properly speaking, but are abjectly afraid of spirits. As intractable cannibals they were cruelly dealt with, their numbers being reduced from 60,000 to some 12,000.

Botolph, the patron saint of Boston (q.v.), died in 680.

Botoșani, or BOTOSHANI, a town of Moldavia, on the Shiska, 62 miles NW. of Jassy, at the terminus of a branch railway, has an active trade in country produce, cattle, grain, and timber; pop. 33,000, about half of whom are Jews.

Bo-tree, the name given in Ceylon to the PIPAL or PEEPUL (q.v.) of India (*Ficus religiosa*). It is held sacred by the Buddhists, and planted close by every temple. The Bo-tree of the sacred but ruined city Anuradhapura, 80 miles N. of Kandy, is in all probability the oldest tree in the world. It is said to have been planted in 288 B.C., as a branch of the tree under which Gautama sat when he became Buddha. Sir James Emerson Tennent believed that the tree was in 1859 really of the wonderful age of 2147 years. Its leaves are carried away as treasures by pilgrims. The main stem was broken off by a storm in October 1887, and the severed portion solemnly cremated with religious rites. See Ferguson, *Ceylon in 1884*.

Botrychium. See MOONWORT.

Botrytis, a genus of Hyphomycete Fungi (see FUNGI), containing many of the plants commonly called mould and mildew. The silkworm disease known as Muscardine (q.v.) is caused by *B. Bassiana*. Some species have been identified as simply conidium-bearing forms of Ascomycetes, like *Peniza* and *Sclerotinia*.

Botta, CARLO GIUSEPPE GUGLIELMO, an Italian poet and historian, born in Piedmont in 1766, studied medicine in Turin, and in 1794 became a physician to the French army. In 1799 he was appointed a member of the provisional government of Piedmont. After the incorporation of Piedmont with France, he repaired to Paris, where, as a member of the *Corps Législatif*, he gave offence to Napoleon. After the Restoration he became rector of academies at Nancy and Rouen; and in 1830 he was allowed to return to his native town, and received a pension. He died in Paris, August 10, 1837. Early works are those on Corfu (1799), Dalmatia (1802), and the American Revolution (1809); and his epic poem, *Il Camillo* (1806). His most important works are the *Histoire des Peuples d'Italie* (1825); and *Storia d'Italia dal 1490 al 1814* (20 vols. 1832), which consists of Guicciardini's work (1490-1534), and his own continuation of it. See the Life of him by Pavesio (1874).

Botta, PAUL ÉMILE, a distinguished archaeologist and traveller, the son of the preceding, was born at Turin in 1802. After extensive travels in the New World and in Egypt, he became in 1833 French consul in Alexandria, and thence undertaking a journey to Arabia, published the results in his *Relation d'un Voyage dans l'Yemen* (1841). He was soon after appointed consular agent at Mosul, and commenced a series of discoveries which form an epoch in archaeological science. Early in the spring of 1843 Botta began his diggings in the heaps of ruins near the Tigris

for monuments of Assyrian antiquity; and the *Journal Asiatique* soon contained accounts of his enterprise, and disquisitions on the cuneiform writing, which afterwards appeared as a separate publication under the title, *Mémoires de l'Écriture Cunéiforme Assyrienne* (1848). The French government took up the matter warmly, and a commission of learned men was appointed to conduct the publication of the magnificent archaeological work, *Monuments de Ninive* (1847-50). In 1848 he published *Inscriptions découvertes à Khorsabad*. In 1846 Botta was appointed consul-general at Jerusalem, and in 1857 at Tripoli. He returned to France in 1868, and died at Achères, near Poissy, 18th April 1870. See ASSYRIA, BABYLONIA.

Bottesini, GIOVANNI, contrabassist, born at Crema, in Lombardy, 24th December 1823. A concert tour, begun in 1840, and extending to America, established his fame as the greatest master of the double-bass fiddle. From 1846 he was director of Italian opera in Havana, Paris, Palermo, and Barcelona, and died 7th July 1889, director of the conservatory at Parma. His compositions include four operas and an oratorio; but his best work is his *Méthode Complète de Contre-basse*.

Böttger, JOHANN FRIEDRICH, improver of the porcelain manufacture, was born 4th February 1682 in Reuss-Schleiz. He became an enthusiast in the search for the philosopher's stone, and found patrons at the court of Saxony. The king, dissatisfied with his gold-making, sought to avail himself of the skill which Böttger really possessed, and the latter was compelled to enter upon those experiments, of which the celebrated Meissen Porcelain was the result (see POTTERY). He died March 13, 1719.

Botticelli, SANDRO, originally Alessandro di Mariano dei Filipepi, a great painter of the Tuscan school, was born at Florence in 1444, the son of a tanner, Mariano di Vanni dei Filipepi. He derived his name from his elder brother Giovanni, a thriving broker, nicknamed Il Botticello. Possibly apprenticed to another brother, Antonio, a gold-beater, he was soon sent to study painting with Fra Lippo Lippi, and was with him during the period of the Pieve frescoes at Prato. The influence of these is very strong in an early 'Adoration of the Magi' in the National Gallery, London. To Lippo's delicacy Botticelli added Antonio Pollaiuolo's relief and movement in the Uffizi 'Fortitude,' a picture which shows also a fleeting influence of Verrocchio. In 1470-73 his old master's son Filippino was his pupil in Florence. Another 'Adoration,' a subject he repeatedly painted, was executed as an altarpiece for Sta Maria Novella, and established his reputation. Literary influences of the Renaissance inspired 'Primavera' (c. 1478) and the much later 'Birth of Venus,' two of his most imaginative works, both painted for Lorenzo di Pierfrancesco de' Medici. The 'Assumption of the Virgin' in the National Gallery is not by Botticelli, but by Francesco Botticini. Botticelli's colouring, often enriched by gold, is brilliant and fanciful, and the minutest care is shown in all the details of his compositions. His flowers, especially his roses, are painted with marvellous delicacy. In the countenances, whether of Madonnas and angels, or of Venuses and Graces, there is a fascinating expression of wistful melancholy. Among Botticelli's greatest works are his three frescoes, representing the 'Life of Moses,' the 'Destruction of Korah, Dathan, and Abiram,' and the 'Temptation of Christ,' executed in 1481-82, in the Sistine Chapel at the Vatican. For the next twenty years he was the most popular painter in Florence. His style in 1482-92 becomes more severe. To this period belong 'The Birth of Venus,' 'Mars and Venus,' 'The Coronation of the Virgin' (Florence

Academy), the circular Madonnas in the Uffizi, and the 'Annunciation,' also there. Botticelli's brother Simone was a follower of Savonarola, and the painter seems to have come under the same influence, but only about the time of Savonarola's execution. Evidence of his conversion, which seems to have cost him the patronage of Lorenzo di Pierfrancesco, has been traced in the 'Nativity' in the National Gallery, the mystical inscription on which appears to give its date as 1500. His great series of pen and silver-point drawings (c. 1492-97), illustrating the *Divina Commedia*, was acquired by the Berlin Museum at the Hamilton Palace sale. It has been admirably reproduced in phototype, with the addition of eight other drawings of the set which were discovered in the Vatican, and facsimiles of the engravings to the Dante of 1481, on which he was probably engaged when summoned to Rome. Botticelli died in 1510.

Botticelli was ignored by early 19th-century art critics, and was not even named by Roscoe. See, besides the histories of Italian painting, books on him by Ullmann (1894), Phillimore (New York, 1894), Plunkett (1900), Julia Cartwright (Mrs Ady, 1904), Diehl (Paris, 1906), Binns (1907), Binyon (1913), and especially Horne (1908); also studies by Bode (trans. 1925) and Yashiro (1925).

Böttiger, KARL AUGUST, a German archaeologist, born in 1760 at Reichenbach, in Saxony, was successively rector at Guben (1784) and Bautzen (1790), and director of the Gymnasium at Weimar (1791). His literary activity was prodigious, but his works, once held in high estimation, are now only valued for the mass of materials they contain. From 1804 he delivered lectures on special branches of classical antiquities and art at Dresden, where he died in 1835. Among his writings may be mentioned *Sabina* (1803), *Amalthæa* (1820-25), and *Ideen zur Kunst-mythologie* (1826-36). His smaller works were collected and edited by Sillig (1837).

Bottle (Fr. *bouteille*, from late Latin *buticula*, diminutive of *butis*, 'a butt'), a vessel, generally of a round shape, with a narrow neck, for holding liquids. The first bottles were probably made of the skins of animals, mostly goats. Skin bottles are still used in southern Europe for the transport of wine, and by tribes of Africa and Asia for carrying water. The ancient Egyptians had bottles of alabaster, stone, gold, ivory, and other substances. Glass bottles, often of great beauty, were made by the Phœnicians and Romans, and in the middle ages at Venice. Porous earthenware bottles have been long in use in the East to keep water cool in. The Chinese have beautiful small bottles of jade, rock-crystal, agate, and a peculiar glass of two coloured layers. Modern bottles are chiefly made of Glass (q.v.), and of stoneware (see POTTERY). See BOTTLING.

From old French *botel* comes *bottle* in the sense of bundle, as in the phrase 'a bottle of hay.'

Bottle-brush Plants, a name applied to species of *Metrosideros*, *Callistemon*, and other genera of *Myrtaceæ* (q.v.), which agree in having sessile crowded flowers with reduced floral envelopes, but large conspicuous compound stamens; the whole inflorescence thus suggesting a red bottle-brush.

Bottle Chart is one which purports to show the track of sealed bottles thrown from ships into the sea. Lieutenant Becher, an English naval officer, constructed in 1843 a chart of bottle-voyages in the Atlantic, so as to illustrate the currents. The time which elapses between the launching of the bottle from the ship and the finding it on shore, or picking up by some other ship, has varied from a few days to sixteen years; while the straight-line distance between the two points has varied from a few miles to 5000 miles. The

Bottle Chart has been re-edited from time to time, and republished.

Bottle-glass. See GLASS.

Bottle-gourd (*Lagenaria*, from Lat. *lagena*, 'a bottle'), a sub-genus of *Cucurbita* (natural order Cucurbitaceæ, q.v.). The Common Bottle-gourd, or False Calabash (*C. lagenaria* or *L. vulgaris*), is a native of India, but is now common almost everywhere in warm climates. It is a climbing musky-scented annual, clothed with soft down, having its flowers in clusters, and a large fruit, from 1 to sometimes even 6 feet in length, which is usually shaped like a bottle, an urn, or a club. The fruit has a hard rind, and when the pulp is removed and the rind dried, it is used in many countries for holding water, and is generally called a *Calabash* (q.v.). In its wild state it is very bitter and poisonous, and even in cultivation some of its varieties exhibit not a little of the bitterness and purgative properties of *Colocynthis* (q.v.). Other varieties, particularly the more luxuriant, however, have a cooling edible pulp. The bottle-gourd appears to have been introduced into Europe about the close of the 16th century, but it requires for its advantageous cultivation a warmer climate than that of Britain. It is, however, much cultivated in warmer countries as an esculent, and its rind lends itself to many domestic uses, often furnishing, for instance, not only bottles and dishes, but spoons and hats. It is grown in some parts of the United States. Another species, *L. idoloratrica*, is a sacred plant of the Hindus, much employed in their religious ceremonies.

Bottlehead, or **BOTTLENOSE** (*Hyperoodon*), one of the toothed whales in the same family as the *Sperm* (*Physeteridae*). The most striking feature is the abrupt rise of the head from the small snout. The bones forming the front of the upper jaw rise suddenly behind the nostrils, expanding in crests as they ascend. The result is a rounded and prominent upper head. There is a small conical tooth hidden in the gum at the end of each lower jaw, and sometimes another behind this again. The blow-hole

Bottlehead.

is crescent-shaped. The colour is blackish, verging to white below. Two species are certainly known, both from the North Atlantic, and sometimes found in the North Sea. *H. rostratus* (or *videns*, or *butzkopf*), the common *Bottlenose*, measures about 24 feet in length, and is sometimes stranded on European shores. One described by Hunter in 1787 was caught above London Bridge. *H. latifrons* is somewhat larger, has a flatter forehead, and attains a length of 30 feet. The genus *Xiphius* is closely allied. The *Hyperoodon* must be distinguished from the Bottle-nosed Dolphin (*Delphinus tursio*) occasionally found on British coasts. See CETACEA, WHALE.

Bottling must be done with every possible precaution to exclude the many organisms always floating about in the atmosphere. The bottles and their corks or stoppers must be scrupulously clean, and so must the liquids or other substances put into them. See GERM. With spirituous liquors, antiseptics, and other non-putrescible things there is no trouble, but with beer, aerated beverages containing syrup, some low-class wines, bottled fruit, very dilute aqueous solutions, &c., there is great fear of the growth of various moulds

and the putrefying influence of bacteria, which can easily grow in these media if their germs happen to get into the bottles. Therefore great care is taken by all the best manufacturers and bottlers of these goods thoroughly to clean or sterilise the bottle and its cork or stopper, as well as the contents, before bottling. If this is carefully done there is no need to use any of the preservatives or antiseptics which are well known, but should be kept out of food on account of their more or less deleterious physiological actions. When corks are used it is advisable to pour boiling water over them just before putting them into the bottles, to sterilise, clean, and soften them. They are then easily driven into the bottle-neck, and as soon as this is done the liquid inside the bottle should be made to touch the cork to ensure that it shall be in the same condition as the rest of the inside of the bottle. Many things may be sterilised by heating them to 180° F. for a little while in the bottle before corking, but in this case care must be taken that no unfiltered air enters the bottle afterwards, lest it should introduce bacteria. In other cases the liquid is carefully filtered just before it is put into the bottle. The so-called aerated beverages are impregnated with carbonic acid gas at the time of bottling, and are thus forced into the bottle under a pressure varying from a few pounds per square inch to 100 lb. or more. At first we might perhaps suppose that this gas would prevent the growth of bacteria, but experience teaches us that some forms grow very rapidly under these conditions.

There are many ingenious machines in daily use for bottling all kinds of beverages, and for putting in the corks, screw stoppers, and various other devices with considerable rapidity, 50 dozen bottles an hour being easily filled and finished. Perhaps the most rapid bottle to fill is that with a glass ball inside it for a stopper. This bottle is put into a machine, which clamps it top and bottom, and holds its mouth against an india-rubber washer, through which the liquid is forced into the bottle. As the bottle fills it is inverted, and the glass ball drops on to another india-rubber ring fitted inside the neck, where it is held by the pressure inside the bottle when it is removed from the machine. These bottles are opened by simply pushing down the glass ball, when the contents may be easily poured out. The usual speed for filling these bottles is about 120 dozen an hour. See AERATED WATERS.

Bottomley, GORDON, poet and dramatist, was born 20th February 1874, at Keighley, and educated at Keighley Grammar School. He published several volumes of verse, including *The Fate of Smaragdus* (1904), *Chambers of Imagery* (1907-12); but it is by his poetical plays that he has most impressed his critical readers. Of these, *King Lear's Wife* (1915) gave its title to a collection which appeared in 1920. *Gravach*; and *Britain's Daughter* (two plays) followed in 1921.

Bottomry, BOND OR CONTRACT OF, is a security by which a ship and tackle is expressly mortgaged or *hypothecated* by the owner or master for repairs to the ship, or for money advanced for its outfit or some other necessary purpose abroad. It is called a security by *bottomry*, because the bottom or keel of the ship is figuratively used to express the whole of it. The loan or debt is repayable only in the event of the ship's safe arrival at the port of destination; and in consideration of this risk the lender or creditor exacts a premium, the amount of which depends on the nature of the adventure. If the ship be totally lost, the lender loses his money; but if she returns safely, he recovers his principal, together with interest at the rate agreed upon.

These contracts are not treated as ordinary mortgages, and preferred according to the order of date; but inversely, the latest is preferred to the preceding, because it is presumed that the last loan saved the ship. Bottomry is sometimes granted in the form of a bill, sometimes as a bond, but it must always be in writing, and must state the sum advanced, with the main interest agreed on (which often amounts to 25 per cent.), the voyage proposed, with the duration of the risk, and whether the security includes cargo as well as ship. The master's authority to grant such a bond arises only in foreign ports, and depends on the question whether the money is necessary to complete the enterprise. The owners of the ship are not personally liable for the advance, as the marine interest generally swallows up their profit, but the master is liable on his own obligation. Where the personal credit of the owner might be obtained by telegraph, the bottomry bond, granted without his authority, is void. The bottomry creditor is not subject to general or particular average. Bottomry was not known to the civil law; the law of the United States is based on that of England. Bottomry contracts, which are subjected to rigid scrutiny, are assignable and negotiable. See INSURANCE, RESPONDENTIA.

Botulism, or SAUSAGE-POISONING. Sausages of pork which have been undercooked or eaten raw are occasionally highly poisonous; and in Germany, where sausages form a staple article of diet, fatal cases of sausage-poisoning are by no means rare. The symptoms are slow in appearing, three or four days sometimes elapsing before they manifest themselves. They resemble those of poisoning by Belladonna (q.v.), and are believed to be due to the presence of animal alkaloids or Ptomaines (q.v.) developed by a special bacillus (*Bacillus botulinus*). Cases observed in Britain differ from those commonly occurring in Germany in this respect, that in England the sausages are usually comparatively fresh, while the sausages which have proved poisonous in Germany had always been made a long time.

Botzen, or BOZEN (Ital. *Bolzano*), an important trading town of German-speaking Tyrol, ceded to Italy in 1919, charmingly situated on the Eisach, 35 miles NNE. of Trent by the Brenner Railway. An Italian-looking place, it has several churches and monasteries—one of the former dating from the 13th century—a castle, and a gymnasium. It is protected from the inundations of a mountain-torrent in the vicinity by a strong wall about 2 miles in length. It has manufactures of silk, cotton, linen, hosiery, leather, flour, and vinegar. Wine and fruits in abundance are produced in the fertile valley of the Adige, protected by lofty mountains. Its earth-pillars are famous. Pop. 25,000.

Boucher, FRANÇOIS, a French painter, was born at Paris in 1703, studied at Rome, and became a member of the Academy (1734), and painter to Louis XV. (1765). He was an artist of much ability, and equally facile in the production of figure and landscape pictures. The number of his pictures and drawings is said to have exceeded 10,000; he also executed engravings. At his death, on 30th May 1770, he was director of the French Academy. See books on him by Gustave Kahn (1905) and Mrs Bearne (1913).

Boucher de Crèvecœur de Perthes, JACQUES (1788-1868), anthropologist and writer, born at Réthel. Through his father, an active botanist, he came under the notice of Napoleon, and was employed in numerous missions to Italy, Germany, Austria, and Hungary. He wrote travels, poems, and an early apology for free-trade; but only his works on early man are of consequence

now. His most renowned discovery was that of the much-disputed human jawbone in the quarries of Moulin-Quignon, near Abbeville, in 1863.

Bouches-du-Rhône ('mouths of the Rhone'), a department in the south-east of France, formerly a part of Provence, with an area of 1971 sq. m. It is divided into the three *arrondissements* of Marseilles, Aix, and Arles. Through the northern and eastern districts the Maritime Alps slope gently down to the basin of the Rhone. Towards the seashore there are several plains of considerable extent; the western portion called the *Camarague* is very unhealthy. The amount of arable land is small; heaths, woods, wastes, and water occupy the rest. The Rhone—which between Arles and the sea separates into several branches, forming a delta, called *Île de la Camarague*—and its affluent, the Durance, are the principal rivers. The department is intersected by several canals of importance, and by a great aqueduct conveying water from the Durance to Marseilles. The soil in some parts is strongly impregnated with salt. The great plain of Crau, to the east, is stony and arid. Besides the *Étang de Berre*, there are numerous salt-lakes communicating with the sea by natural or artificial channels. Coal, marble, limestone, and gypsum are found. Hats, perfumes, soap, olive-oil, vinegar, and chemical products are manufactured; there are extensive brandy-distilleries and sugar-refineries; the produce of the salt-works is larger than that of any other part of France, and that of wine is large. Pop. (1872) 554,911; (1921) 841,996.

Boucicault, DION, dramatist and actor, was born at Dublin, 26th December 1822, was educated at University College, London, and died in New York, 18th September 1890. Among his 140 and more original pieces and adaptations, produced from 1841, were *The Colleen Bawn* (1860), *The Octonion* (1861), *Arrah-na-Pogue* (1864), *Flying Scud* (1866), *Formosa* (1869), *The Shaughraun* (1875), and *The Jilt* (1886).

Boudin, LOUIS EUGÈNE, French painter, a forerunner of the impressionists, was born at Honfleur, 12th July 1824, son of a pilot and a stewardess. Till his fourteenth year a cabin-boy, then shop-boy to his father, who had turned stationer at Havre, he was self-taught. With a small allowance from Havre town council, he went to Paris; and for a time he taught painting in an old inn near Havre. At intervals he worked as a labourer, and lived at Trouville, Havre, Deauville, and Brussels. Successful in later life, he died at Deauville in 1898. See (Gustave Cahen, *Eugène Boudin: sa Vie et ses Œuvres* (Paris, 1900).

Boué, AMI, geologist, was born at Hamburg, 16th March 1794; studied at Geneva, Paris, Edinburgh, and Berlin; lived at Paris, and then at Vienna, where he died, 22d November 1881. He travelled extensively, and wrote many geological works, one on the geology of Scotland (1820), and three on the geology of Turkey in Europe.

Boufarik, a town of Algeria, 23 miles S. of Algiers by rail; pop. 6000.

Boufflers, LOUIS FRANÇOIS, DUC DE, peer and marshal of France, one of the most distinguished generals of his time, was born in 1644, of an ancient family of Picardy. He began his military career early, and served under the great Condé, Turenne, and Catinat in the wars of Louis XIV., with such distinction that he received the marshal's baton in 1693. His famous defence of Namur against William III. in 1695, and of Lille against Prince Eugene in 1708, made him a duke and peer of France. After the defeat of Malplaquet in 1709,

he conducted the French retreat with admirable skill and success. He died at Fontainebleau, 20th August 1711.—His son, JOSEPH MARIE, Duc de Boufflers (1700–47), was likewise a marshal of France.

Boufflers, STANISLAS, MARQUIS DE, commonly styled the Chevalier de Boufflers, was born at Lunéville in 1737. He was the son of the witty Marquise de Boufflers, who played a brilliant part at the court of Stanislaus, the exiled king of Poland. He became *maréchal de camp*, *negrophil* governor of Senegal, was a poet and literary man of some note, and much admired in the French *salons* of his time. He died in 1815.

Bougainville, the largest of the Solomon Islands (3500 sq. m.; pop. 15,000), at the NW. end of the group, is very mountainous, reaching 10,000 feet in the mountain of Balbi. Bagama is an active volcano. Bougainville was taken from the Germans by Australians in 1914.

Bougainville, LOUIS ANTOINE DE, navigator, was born at Paris, 11th November 1729, studied there, and attained great proficiency both in languages and science. In 1755 he went as secretary of the French embassy to London. In 1756 he acted as Montcalm's aide-de-camp in Canada, where he served with distinction, as also in the campaign of 1761 in Germany. After the peace he entered the naval service, in which he soon signalled himself. He undertook a voyage round the world (1766–69) with a frigate and a St Malo transport, the first voyage round the world which the French ever accomplished. He gave an account of it in his *Description d'un Voyage autour du Monde* (1771–72). Geography and other branches of science were enriched by it with many discoveries. In the North American war Bougainville commanded several ships of the line, and in 1779 was made *chef d'escadre*; in the following year he was made a field-marshal in the army. After the outbreak of the Revolution he retired from public service, and devoted himself entirely to scientific pursuits. By Napoleon I. he was made a senator, count of the empire, and member of the Legion of Honour. After him are named one of the Solomon Islands, a strait in the New Hebrides, and a bay on the north side of the Strait of Magellan. He died 31st August 1811.

Bougainvillea, a neotropical genus of Nyctag.

Bougainvillea, foliage and flowering branches: a, two sets each of three flower-buds, with coloured bracts.

ginaceæ, frequently trained over trellises or under

the roofs of greenhouses, on account of the beauty of its peculiar inflorescence, the small flowers, which grow in threes, being almost concealed by as many membranous bracts of splendid rosy or purple colour.—The same name is given to a genus of hydroid zoophytes.

Bough, SAMUEL, R.S.A., landscape-painter, was born 8th January 1822, at Carlisle, where for two years he was employed in the office of the town-clerk. He received hints from various painters, but never obtained any systematic art instruction. In 1845 he was a scene-painter in Manchester, and later in Glasgow, where Daniel Macnee, afterwards P.R.S.A., encouraged him to become a landscape-painter; and he shortly produced several sketches in Cadzow Forest, and 'Shipbuilding on the Clyde.' Among the more important of his oil-pictures are 'Edinburgh from the Canal' (1862); 'Holy Island' (1863); 'In the Trossachs' (1865); 'The Vale of Leith' (1866); 'Kirkwall Harbour' (1867); 'Borrowdale'; 'St Monance'; 'London from Shooter's Hill' (1872). His 'Royal Volunteer Review' (1860) is in the National Gallery of Scotland. His best oil-pictures are spirited and expressive in touch, and possess a fine sense of atmosphere; but he frequently painted carelessly and hurriedly. His numerous water-colours are of more uniform excellence; they are strongly influenced by the example of David Cox. He settled in Edinburgh in 1855, became R.S.A. in 1875, and died 19th November 1878. See Life by Sidney Gilpin (1905).

Boughton, GEORGE HENRY, R.A. (1833–1905), was born near Norwich, was taken as an infant to America, and learnt and practised painting at Albany, N.Y.; but afterwards studied in Paris, and in 1862 settled in London. He was said to have 'made a corner in pretty Puritans,' and relied largely on anecdotic interest.

Bougie, a port of Algeria, on the Bay of Bougie, 120 miles E. of Algiers. Bougie was the *Saldie* of the Romans, and in the 5th century was a chief seat of the Vandals; under the Arabs it was raised to such importance that it was called Little Mecca, and was the entrepôt of the trade between Christendom and North Africa; but after various vicissitudes, it had sunk to a small village in 1833, when the French captured the place. Their extensive works have since rendered it a strong fortress, and a commercial centre of some value. Pop. 10,500.

Bougies are rods of metal or other substances, used for distending contracted mucous canals, as the gullet, bowels, or urethra (see STRICTURE). For the urethra, they are frequently of German silver or pewter, and vary from $\frac{1}{16}$ th to $\frac{3}{16}$ th of an inch in diameter. Still larger sizes are used by many surgeons. For the other canals, they are usually made of plaited thread, like an ordinary riding-whip, impregnated with a substance called *gum-elastic*, of which the chief constituent is india-rubber. This combination of materials possesses a degree of firmness united with flexibility, and a smoothness of surface very suitable for the end to be attained. In form they are cylindrical, with either a slightly tapered round extremity, or a somewhat acorn-shaped dilatation at or near the point. The name is also applied to rods of similar shape made of gelatin, cacao-butter, or some such substance, which melts at the temperature of the body, and charged with medicaments, which it is desired to apply to the mucous membrane of the urethra or the nasal cavities.

Bouguer, PIERRE, a great French physicist, born at Croisic, in Brittany, 16th February 1698. In 1735 he was sent with Godin, La Condamine, and

Jussieu to South America to measure a degree of the meridian at the equator. During their seven years' absence Bouguer and his companions made valuable observations on the length of the seconds pendulum at great elevations, the deviation of the plumb-line from a vertical position through the attraction of a neighbouring mountain, the limit of perpetual snow, the obliquity of the ecliptic, &c. He published an account of his labours in the *Théorie de la Figure de la Terre* (1749). His investigations concerning the intensity of light laid the foundation of photometry; their results were fully embodied in his *Traité d'Optique* (1760). In 1748 Bouguer invented the heliometer, afterwards brought to greater perfection by Fraunhofer. He died at Paris, August 15, 1758.

Bouguereau, WILLIAM ADOLPHE (1823–1905), was born at La Rochelle. While engaged in business at Bordeaux he was instructed in art; and proceeding to Paris, he worked under Picot, and in the École des Beaux Arts, where in 1850 he gained the *Grand Prix de Rome*, which entitled him to study in Italy, whence he returned in 1855. In 1849 he produced his dignified and austere 'Angel of Death,' but he first made a distinct mark in 1854 by 'The Body of St Cecilia borne to the Catacombs,' which, along with his 'Philomela and Procne' (1861), is now in the Luxembourg. His productions are distinguished by a kind of cultured academic grace, finished and balanced design, and careful execution with a smooth surface. He is seen at his best in classical subjects, and in idealised scenes from rural life.

Bouhours, DOMINIQUE (1628–1702), regarded by Addison as the greatest French critic, was born at Paris, bred a Jesuit, and became professor of grammar and rhetoric at Paris and Rouen. He wrote several works on criticism, a life of Xavier (translated by Dryden), and the epitaph on Molière.

Bouilhet, LOUIS HYACINTHE, French poet and dramatist, was born at Cany (Seine-Inférieure), 27th May 1822. He studied surgery for a time under Flaubert's father, then taught Greek and Latin. Some of his plays in verse—*Mme. de Montarcy*, *Hélène Peyron*, *La Conjuration d'Amboise*—were acted with success. He also wrote several volumes of undramatic poems, *Melans*, *Fossiles*, *Festons et Astragales*, *Dernières Chansons*. He died at Rouen, 18th July 1869.

Bouillé, FRANÇOIS CLAUDE AMOUR, MARQUIS DE, was born in 1739 at the castle of Cluzel, in Auvergne. He served in the Seven Years' War, and became commander-in-chief of the French forces in the West Indies; and from the British he took Dominica, Tobago, St Eustache, Saba, St Martin, St Christopher's, and Nevis. Louis XVI. nominated him a member of the Assembly of Notables in 1787–88; in 1790 he was made commander-in-chief of the army of the Meuse, the Saar, and the Moselle. His decision of character prevented the dissolution of the army and the outbreak of civil war. For his share in the attempted escape of Louis XVI. he had to flee from France. In 1791 he entered into the service of Gustavus III. of Sweden, and afterwards served in the corps of the Prince of Condé. He rejected a proposal made in 1793 that he should take the chief command in La Vendée, and went to England, where his advice in West Indian affairs was useful to the government, and where he wrote his *Mémoires sur la Révolution Française*. He died in London, 14th November 1800. See Gabriel's *Louis XVI.*, *Bouillé*, et *Varennes* (1874).

Bouillon, a duchy, originally German, in the Belgian part of the grand-duchy of Luxembourg, consisting of a woody and hilly district in the Ardennes, about 145 sq. m. in extent. This duchy

was the possession of the famous crusader, Godfrey (q.v.) of Bouillon, who, in order to raise money for his crusade, pledged it in 1093 to the Bishop of Liege. It was conquered by France in the war of 1672. By the peace of 1814 the greater part of it was included in the grand duchy of Luxemburg, and the sovereignty of it passed to the king of the Netherlands. By the revolution of 1830 Bouillon, along with Luxemburg, was separated from the Netherlands, and in 1837 united to Belgium.—The principal town is Bouillon, situated among steep hills on the Semois, 9 miles NNE. of Sedan, and near the French frontier. The town lies in the bottom of a deep wooded valley, where the Semois bends sharply round a precipitous rock, on which stands Godfrey's castle. The rock is pierced by a tramway tunnel, connecting the two ends of the town. The romantic scenery of the district has made Bouillon a tourist-resort. Pop. 3000.

Bouilly, JEAN NICOLAS, a prolific French dramatist, born at La Coudraye, near Tours, 24th January 1763. During the fever of the Revolution he filled with rare prudence several important public offices. He died at Paris, 14th April 1842. In his writings Bouilly reveals a character of great elevation and sincerity, but the effect is somewhat marred by his prolixity and by an over-sentimentality that earned him the name of the 'poète lacrymal.' Of his plays the following deserve mention: the comic opera *Pierre le Grand* (1790), *L'Abbé de l'Épée* (1795), *Les deux Journées* (1800) for Cherubini's music, *Fanchon* (1803), *Une Folie* (1803), *Madame de Sévigné* (1805). He wrote many popular books for the young, including *Contes à ma Fille* (1809).

Boulainvilliers, HENRI, COMTE DE (1658–1722), descended from an ancient family in Picardy, was born at St Cère, in Normandy, served in the army, and wrote largely, from the aristocratic point of view, on the ancient government of France, the French peerage, and the parliament of Paris. Some of his historical works are yet unpublished. He also dabbled in astrology, but is remembered chiefly for his pretended *Réfutation des Erreurs de Spinoza*, which is a sympathetic exposition of Spinozism, and a *Vie de Mahomet*, equally antichristian in intention. Both works were posthumously published; and a (French) translation by him of Spinoza's *Ethica* was published by Colonna d'Istria in 1907.

Boulak. See BULĀQ.

Boulanger, GEORGE ERNEST JEAN MARIE, a French general, was born at Rennes in 1837, and was educated at St Cyr. He served in Algeria, Italy, and Cochinchina; was with Bazaine at Metz, but escaped to Paris, and held a lieutenant-colonelcy under the Government of National Defence; in 1876 headed the deputation of French officers at the celebration of the centenary of American Independence; became brigadier-general in 1880 by the influence of the Duc d'Aumale; and in 1884–85 commanded the army of occupation in Tunis, till an arbitrary attempt to exalt the military over the civil authority led to his recall. He was wounded in action in Italy and during the Commune. He was minister of war from January 1886 to May 1887, urged forward the expulsion of the Duc d'Aumale and the other princes from France, and through the introduction of some desirable army reforms and the appearance of a fortunate music-hall song in his praise was adopted as the embodiment of the 'revenge' policy by the Parisians, who for some months suffered from what was termed the Boulanger fever. In 1887, while commanding an army corps at Clermont-Ferrand, he was, for his remarks on the war minister, ordered under arrest for thirty days. In March

1888, for disobedience to orders, he was deprived of his command, but was immediately elected deputy for Dordogne, and shortly thereafter for Nord. He was wounded in a duel with M. Floquet, the minister-president, in the same year. Boulangerism became still more formidable in 1889, and was supported with large sums of money by leading Royalists for their own ends. But when the government prosecuted Boulanger for intrigues against the republic and malversation of funds, he fled the country (1889). He was condemned in absence; his schemes wholly collapsed, and on 30th September 1891 he shot himself on his mistress's grave in a cemetery in Brussels.

Boulay de la Meurthe, ANTOINE, COUNT, a French statesman, born at Chaumouzey, in the Vosges, in 1761. He espoused the cause of the Revolution, but became known as the opponent both of Jacobinism and the despotism of the Directory. Under the Empire he had an important part in the preparation of the *Code Civil*. Returning in 1819 from Germany, he lived in retirement at Paris, where he died 2d February 1840. He published an essay on the *Commonwealth in England* (1799), and *Bourrienne et ses Erreurs* (1830).

Boulder, a city and health-resort of Colorado, 28 miles NW. of Denver, is centre of an agricultural and mining region, producing gold, silver, tellurium, and oil, and seat of the university of Colorado (1877); pop. 11,000.

Boulder, a municipality of Western Australia, adjoining Kalgoorlie; pop. 8000.

Boulder-clay is a stony clay which has a very wide geographical distribution. It occurs in the British Islands, as far south as the Bristol Channel and the valley of the Thames. It overspreads extensive areas in Scandinavia, Holland, Northern Germany, and Central and Northern Russia. In the lower valleys of the Alps, and many other mountain districts of Central and Southern Europe it is also well known. It has likewise been traced over vast regions in British America and the northern states of the Union. Boulder-clay varies in thickness from a few feet up to 20 or 30 yards—being generally thickest upon low-lying regions, and thinning away as it is followed up towards the mountains. It is unstratified, and contains stones scattered confusedly through its mass without any reference to their relative size and weight. These stones are of all shapes and dimensions, from mere grit up to great blocks several tons in weight. Many of them are blunted and subangular, and show on one or more sides that smoothed, abraded, and striated appearance which is characteristic of glacial action. The clay itself is generally more or less tough and hard, and has apparently been subjected to intense pressure, as is further shown by the presence now and again of a kind of 'pseudo-lamination' or 'pseudo-bedding,' often marked by differences of colour, and sometimes by lines of stones. These structures appear to be due to the shearing and yielding of the clay under pressure. Here and there lenticular patches of water-worn stones, and gravel, sand, and clay occur completely inclosed in the tumultuous stony clay—being confused, contorted, and involved with the latter in such a way as to show that they and the stony clay had been rolled forward upon each other. The included stones are more or less local in character—that is to say, the great majority in any individual sheet of boulder-clay have been detached from rocks belonging to the drainage area within which that particular sheet of boulder-clay occurs; while those fragments which have come from a greater distance can be shown to have travelled in one and the same direction as the locally derived stones and boulders. In like manner, the colour of

the clay is more or less local. Thus, in regions composed largely of red-coloured rocks, the boulder-clay is red; while it may be yellow, gray, or blue in other regions, according to the prevailing colours of the rocks upon or near to which it lies. Fossils have been met with at rare intervals in boulder-clay, but these are always derivative, and not unfrequently they are smoothed and striated in the same manner as the stones; in other words, they are boulders just as are the stones amongst which they lie. In many places, where the boulder-clay has been stripped off the underlying rocks, these are found to present a highly smoothed and abraded surface, streaked with rectilinear grooves and scratches, the trend or direction of which corresponds with that followed by the stones and boulders in the boulder-clay. Not unfrequently, however, the underlying rocks present a very shattered and confused appearance under the clay—larger and smaller masses being inclosed in the lower part of the boulder-clay—the bottom portion of which, indeed, is often entirely composed of the debris of underlying rock-masses, which have all the appearance of having been torn out of their places and dragged forward in the direction followed by the further-travelled blocks and boulders of the boulder-clay. In the lower reaches of mountain valleys, as in those of Britain, the Alps, the Pyrenees, &c., boulder-clay tends to form gently undulating or approximately level sheets or layers, which being cut through by streams or rivers, form more or less bold bluffs and scours. In some low-lying tracts, however, it is often arranged in long parallel banks known as ‘drums’ or ‘drumlins’—the general trend of which corresponds with that of the stria or scratches on the underlying rocks, and with the direction followed by the boulders in the boulder-clay. Excellent examples of *drums* occur in Nithsdale and in the lower valleys of the Teviot and the Tweed. In these and many other regions the boulder-clay is frequently found heaped up on one side of prominent rocky knolls and hills, the steep faces of which *front* the direction in which the boulders of the clay have travelled. This is the appearance called ‘crag and tail’—the tail being composed largely of boulder-clay. As examples may be cited Edinburgh Castle, Dalmahoy Crags, and other isolated hills near Edinburgh. The origin of boulder-clay, which has been the subject of much discussion, is now hardly in dispute. Boulder-clay is unquestionably the product of glaciation, and the phenomena mentioned above lead to the belief that this stony clay is simply the bottom-moraine or ground-moraine of extinct glaciers, which formerly had a most extensive development in the northern and temperate latitudes of the globe (see GLACIAL PERIOD, MORAINES). Boulder-clay must not be confounded with the *marine* clays, which contain the remains of marine shells, &c. of arctic and northern species. These clays are usually more or less well bedded, and the stones contained by them have evidently been dropped from floating ice. Boulder-clay is known in Scotland as *Till*—a term which many geologists prefer, inasmuch as boulder-clay is often rather a stony earth than a clay. Formerly the terms *Diluvium* and *Drift* were used to designate boulder-clay and certain gravelly and arenaceous deposits frequently associated with that accumulation; but they are now seldom or never used. In the Alpine regions boulder-clay is known under the names of *Grund-morane*, *Moraine profonde*, or *Moraine de fond*; in Germany it is called *Geschiebemergel*, *Geschiebelehm*, or *Blocklehm*; and *Krostenclera* in Sweden.

Boulders, ERRATIC, are large masses of rock found at a distance from the formations to which they belong. The term is generally applied when they are found lying detached on the surface.

Large blocks of Scandinavian rocks are scattered over the plains of Denmark, Prussia, and Northern Germany. From their magnitude and number they frequently form a striking feature in the landscape. Some of these have been washed out of the Boulder-clay (q.v.), but the larger number are dotted over the surface of the terminal moraines of the great northern ice-sheet (see GLACIAL PERIOD). They abound on the shores of the Firth of Forth. Such boulders are simply the residue of the boulder-clay which has been denuded and washed away by the action of the sea. The pedestal of the statue of Peter the Great, in St Petersburg, was hewn out of a large erratic boulder, 1500 tons in weight, that lay on a marshy plain near that city. The boulder called *Pierre de Marmettes* at Monthey, in the canton of Valais, contains 70,630 cubic feet, and is

Erratic Boulder at Monthey.

large enough to have a chalet built on it. From the nature of the stone, it is believed to have been carried by glacier action a distance of 35 miles down the valley. On the other hand, the well-known ‘Bowder Stone’ of Borrowdale (q.v.) is simply a detached block, which has fallen from the adjacent crags.

Boulé, in ancient Greek states, was a council, oligarchic or democratic. In Athens the Boule is said to have been established by Solon with 400 members (100 for each tribe), remodelled by Cleisthenes. Besides performing various administrative duties, the Boule or its committees prepared business for the Ecclesia, and made recommendations.

Boule, or BOULLE. See BUHL.

Boulenger, HIPPOLYTE (1838–74), Belgian landscape-painter, was born at Tournay, and was distinguished not less for his refined draughtsmanship than for his delicate colour. He is well represented in the Brussels Gallery.

Boulevard (Fr., of Teutonic origin = Ger. *bolwerk*; cf. Span. *baluarte*, Ital. *baluardo*, ‘bulwark’), the name given in France to a broad street or promenade planted with rows of trees. Originally it was applied to the bulwark portion of a rampart, then to the promenade laid out on a demolished fortification. The boulevards of Paris are the most famous. The line from the Madeleine to the Bastille became a walk in the days of Louis XIV., and then a street. The so-called outer boulevards date from 1786, and were also old fortifications, levelled and planted. But many so-called recent boulevards in Paris and elsewhere are simply new and handsome streets, planted with trees, and have no relation to old fortifications at all. Some parts of them present a very dazzling spectacle; and, as a whole, they afford a striking exhibition of the life and character of the French capital in all the different classes

of society. The *Boulevards de la Madeleine, des Capucines*, and *Montmartre* are the most notable. The Thames Embankment is a boulevard in the usual sense of the term

Boulogne-sur-Mer, a fortified seaport in the French department of Pas-de-Calais, situated at the mouth of the Liane, in the English Channel, 27 miles SW. of Calais, and 158 N. by W. of Paris by rail. The town consists of two parts—Upper and Lower Boulogne. The upper town was in former times strongly fortified; but its ramparts have been converted into beautiful promenades, from which, in clear weather, Dover Castle can be seen. The hôtel-de-ville occupies the site of the castle where Godfrey de Bouillon was born in 1061. The former cathedral, rebuilt (1827–66) in the Italian style, has a dome 300 feet high, and a miraculous image of the Virgin. The lower town, the seaport proper, is newer, more populous, and more lively, inhabited chiefly by merchants, mariners, and fishermen. It contains the barracks, the great hospital, the theatre, the museum and gallery of art, and many elegant residences. Boulogne has a college, several schools, English as well as French, and a public library; there are extensive and excellent salt-water baths; and, on account of its fine sands, it is a favourite, though somewhat expensive, resort for sea-bathing. The English residents are less numerous than formerly. Pop. (1872) 39,700; (1921) 55,336, actively engaged in the manufacture of linen, cordage, iron, steel pens and buttons, oil, soap, and chemical products. Boulogne is the chief station in France of the North Sea fisheries. It has an active coasting trade, and ranks with Calais as one of the nearest and most frequented places of passage between France and England. The principal imports are woollen, cotton, and silk material; the exports are manufactured fabrics, leather, and wine. The harbour of Boulogne has been repeatedly enlarged and improved. A large wet-dock was completed in 1872; and a new deep and extensive outer harbour was constructed in 1878–1904. The blue clay cliffs have been cut away, and a solid sea-wall built of the stone and soil; and the works, which have been steadily pushed forward, include outer moles and an inner mole or traverse. A dock deep enough to take the largest vessels was opened in 1912, and further extensive harbour works were afterwards undertaken to provide a safe anchorage for the largest Transatlantic liners. The whole French navy could find a haven in this harbour, where the largest ships may lie at anchor even at low-water. Boulogne was known to the Romans as *Portus Gesoriacus*, but after the time of Constantine the Great it was called *Bononia*, and after that of the Carlovingians, *Bolonia*. In 1435 it came into the possession of the Duke of Burgundy, and it was united with the crown of France by Louis XI. in 1477. The town was taken by the English in 1544, and restored to the French in 1550. From this point has been contemplated every invasion of England since the days of Caligula; and here Napoleon encamped 180,000 men and collected 2400 transports, ready at any favourable moment to swoop down on the shores of Britain; but after months' watching, the war with Austria created other employment for them. As a memorial of this great camp, a tall marble column was erected on the higher grounds, and in 1841 surmounted by a colossal statue of Napoleon. In 1840 Boulogne was the scene of one of the adventurous expeditions of Louis Napoleon, who was imprisoned in the citadel. The poets Churchill and Campbell, and Le Sage, the author of *Gil Blas*, died here.

Boulogne-sur-Seine, a town of France, in

the department of Seine, on the right bank of the river Seine, about 5 miles SW. of Paris, from which it is separated by the Bois de Boulogne. It has numerous villas, and hundreds of wash-houses on the river, which is here crossed by a fine stone bridge of twelve arches. Pop. 68,000. The Bois de Boulogne is traversed by many walks, through the broadest of which the fashionable world of Paris travels in Easter-week to the Abbey of Longchamp. At the entrance of the wood lies Auteuil (q.v.). During the Revolution the trees of the older walks were mostly cut down; but when Napoleon chose St Cloud, in the immediate neighbourhood, for his summer residence, new walks were planted and laid off, and the enclosing walls were restored. The Bois again became a scene of desolation during the siege of 1870–71, but this favourite place of recreation was soon restored to its former beauty and popularity.

Boulton, MATTHEW, a celebrated English engineer, was born 3d September 1728, at Birmingham, where his father had made a considerable fortune as a silver stamper and piercer. On his death in 1759, Matthew carried on the business with great energy, and extended it by the purchase of a piece of land, then a barren heath, at Soho, near his native town, his works there being opened in 1762. Here he improved not only the workmanship, but the artistic merit of his work. One of his first inventions was a new mode of inlaying steel. He entered into partnership with James Watt (q.v.), who had obtained a patent for his great improvements in the steam-engine, and they established a manufactory of steam-engines in 1774. After eighteen years of anxious labour, this department of the business began to be remunerative. They jointly contributed also to the improvement of coining machinery, and so of the coinage itself. It was only in 1882 that a Boulton press, at the Mint, Tower Hill, was finally discarded. Boulton obtained a patent in 1797 for his method of raising water by impulse. He died at Soho, 18th August 1809. His long life was devoted to the promotion of the useful arts and of the commercial interests of his native country. He was a Fellow of the Royal Society, and member of the Lunar Society, and was on terms of friendship with the chief scientific and literary men of his time; he was a man of extremely pleasing conversation, and of a most generous disposition. See Smiles's *Lives of Boulton and Watt* (1865).

Bound, or BOUNDARY, the utmost limits of land by which the same is known and can be described. These are recognised in various ways—e.g. by a line of march stones, a hedge, a ditch; by reference to possession of tenants; by reference to a plan; by measurement. The plan is the safest, because least ambiguous, boundary. A boundary-fence generally belongs equally to the two neighbours. A boundary by the sea gives property in the foreshore (see BOUNDING CHARTER). The boundaries of towns depend in many cases on those of a grant of lands or jurisdiction anciently made to the town. The Reform Acts of 1832–33, 1867–68, and 1884–85, or commissions acting under them, defined the boundaries of many boroughs for the purposes of parliamentary elections; but these are in many cases different from the municipal boundaries. Municipal boundaries may be altered by a local act, or by an order of the Ministry of Health or the Board of Health confirmed by parliament. A county council has power to adjust the local government areas within the territory which it is elected to administer—e.g. to define the boundaries of the district of an urban or rural council. Parishes may be united by the Ministry of Health or the Board of Health or by the county council, which

has also power to transfer a part of one parish to another. Provision is made in the Local Government Act, 1894, for the adjustment of property, income, and liabilities in case of alteration of boundaries by such orders of a county council. In Scotland the Court of Teinds has power to alter the boundaries of an ecclesiastical parish, and to unite and create parishes. Boundary commissioners, under the Local Government Act, 1889, have settled the boundaries of counties and parochial areas in Scotland for administrative purposes. But there remain with the Secretary for Scotland large powers, on the recommendation of a county council or town council, to alter the area of any county, burgh, or parish for civil purposes. In the United States the determination of the boundaries of the several states lies, under the constitution, with the Supreme Court of the United States.

Bounding Charter, in the Scots law, is a charter which describes the lands by their boundaries. It gives right to everything within the bounds, but it prevents the acquisition by possession of any piece of property outside the bounds, even although the charter contains a clause of parts and pertinents. This rule, however, does not apply to servitudes, which can be acquired beyond the limits of a bounding charter, nor to such an incorporeal right as salmon-fishing. If the boundary be the sea or the seashore, the right is extended or limited as the sea permanently recedes or advances. If, again, it be a stream, the property may be subject to alteration, either extended by Alluvion (q.v.), or the gradual and imperceptible variation of the channel; or the stream may cease to be the boundary, in consequence of some violent change. But if the property described in the charter is bounded by walls, the walls, as a general rule, will not be held as included in the grant; and where it is intended that a wall is to be mutual, this must be expressed. When the grant is described both by boundaries and by measurement, the boundaries determine its extent, although containing a larger quantity of ground than the measurement. See CHARTER, CONVEYANCE, GRANT, and TITLE.

Bounds, BEATING OF THE, or *Perambulation*, the popular expression in England for those periodical surveys or perambulations by which the ancient boundaries of parishes used to be preserved, and which in many respects resembled the old Roman *terminalia*, celebrated every year on February 23, the last month of the year. On Holy Thursday or Ascension-day, the clergyman of the parish, with the parochial officers and other parishioners, followed by the boys of the parish school, headed by their masters, used to go in procession to the different parish boundaries, which boundaries the boys struck with peeled willow-wands that they carried in their hands. Sometimes the boys were whipped at important points 'to make them remember.' At Shewsbury the bounds-beating was called Banning, and was kept up annually to the middle of the 19th century. At Ludlow it still retained its religious character in 1822. For an account of the ceremonies, see Brand's *Popular Antiquities*, under 'Rogation Week and Ascension Day.' The custom is not confined to England. See Mackenzie Wallace's *Russia*.

Bounty, a term applied to any sum granted by the legislature towards creating or encouraging some kind of undertaking believed to be of national importance. At one time the system of granting such bounties was very prevalent, and it still continues in some countries. There were bounties on the tonnage of vessels employed in the herring and whale fisheries; on the importation of materials of manufactures; on the importation of indigo from

the colonies; on the exportation of Irish and Scottish linen. That this system was a costly and factitious process for fostering commerce, manufactures, and agriculture was ably contended by Adam Smith in his *Wealth of Nations* (1776). With regard to the herring-fishery in particular, the drift of his remarks is to show that in consequence of the bounty the herrings cost more to the government than the price they fetched in the market. The bounty on linen, which was not abolished till 1830, had before that time averaged £150,000 a year. The bounty on the exportation of grain from England, abolished in 1814, had for some years averaged £160,000. The French still give bounties to encourage their cod-fishery on the Banks of Newfoundland, and are second only to Japan in bounties on shipping. In 1911 the Japanese and French bounties on shipping were £1,400,000 and £1,335,000 respectively. The most important form of the recent bounty system was that on beet-sugar, long maintained in Germany, France, Austria, Holland, and Belgium. The bounty on sugar was not a direct one, but was paid on the principle of returning on exportation the sum charged as inland duty. In consequence of mechanical improvements, the quantity of sugar actually extracted from the beet-root was greater than the estimated yield on which duty is paid. Thus the government paid as drawback a sum greater than it received as revenue, and, accordingly, spent a considerable amount in artificially encouraging the production of sugar. The annual average of sugar bounties in 1887-90 was in France about £800,000, in Belgium £170,000, in Holland £150,000. In 1901-2 a conference at Brussels, representing Austria-Hungary, Belgium, Britain, France, Germany, Italy, Netherlands, Spain, and Sweden, adopted a convention suppressing direct and indirect bounties on sugar production and export. The bounty designed to stimulate exportation must be distinguished from the Drawback (q.v.), meant to put in a fair position for exportation those commodities more heavily taxed at home than abroad. For proposals to extend bounties in this country, see Final Report of the Committee on Commercial and Industrial Policy after the War (1918); and for criticism, *The New Tariffism*, by J. M. Robertson (1918). See FREE TRADE.

An annual grant of £2000 to the Church of Scotland for mission purposes is called the Royal Bounty. Another annual grant called the Royal Bounty has long been given in Britain for improving the breed of horses. It had been generally expended in prizes at race meetings; but a Royal Commission in 1887 recommended that it should be given in prizes for thoroughbred stallions at horse-shows. The name King's Bounty is popularly given to a charitable donation bestowed on the mother of triplets. For Queen Anne's Bounty, see that article.

Bounty is also the familiar name for the sum of money given to induce men to enter the army or navy, or to continue their service after their engagement is completed. In time of peace, or when there is little or no need to augment the forces, the bounty sinks to a minimum or disappears. In the British army no bounty was paid to recruits until the 19th century; the temptations offered to them, if any, were of some other character. The highest bounty ever paid during the great wars against Napoleon was in 1812, when it amounted to £18, 12s. 6d. for limited service, and £23, 17s. 6d. for life; but these sums were subject to many unfair and absurd deductions; and even so late as 1849, when the bounty to an infantry recruit was nominally £4, he received little more than one-eighth of that amount. In 1855 the bounty was £7 per head (for line infantry); in

1856, only £2; in 1858, £3; and it afterwards underwent further changes. It was always higher in the cavalry and artillery than in the infantry, and higher in Highland than other line regiments, on account of matters connected with dress and personal ornaments. It was supposed that recruits were tempted more by immediate bounty than by prospective pay and pensions; so that while the rate of bounty varied frequently, that of pay and pensions underwent little change. The term bounty is also used in the navy to signify the distribution of money made to officers and men on particular occasions of active service. See **BOOTY**, **PRIZE**, **SALVAGE**.

In France and Germany considerable bounties have had to be offered to soldiers to induce them to serve in the colonies.

In the United States the term has a like width of application for grants to induce men to enter the army (as much sometimes as \$1000 during the stress of the Civil War), the sum paid to a war-vessel that sinks or destroys an enemy's ship, and grants of land to soldiers and sailors, their widows and children, for services in the army and navy; as also for sums of money paid by government to owners of fishing-vessels for the encouragement of that industry, and to sums appropriated by state legislatures for the destruction of wild beasts and destructive birds, when the country was comparatively new and sparsely settled. See also **PENSIONS**.

Bounty, **MUTINY OF THE**. See **PITCAIRN ISLAND**, **BLIGH**.

Bouquetin. See **IBEX**.

Bourbaki, **CHARLES DENIS SAUTER**, French general, born at Pau, 22d April 1816, entered the army in 1836, and fought in the Crimea and Italy. In 1870 he commanded the Imperial Guard at Metz, from whence he was sent to England, on a secret mission to the empress. Under Gambetta he organised the Army of the North, and commanded the Army of the Loire. His attempt to break the Prussian line at Belfort, though ably conceived, ended in disastrous failure; in a series of desultory attacks on a much inferior force, January 15-17, 1871, he lost 10,000 men. In the wretched retreat to Switzerland that followed on the 27th, reduced to despair by the ill-success of his plans, he attempted to commit suicide. In 1873-79 he commanded the 14th Army Corps at Lyons, and in 1881 he retired. He died 18th September 1897.

Bourbon, a French family which for several generations occupied the thrones of France and Naples, and still rules in Spain. It derived its name from the castle and seignior of Bourbon, in the former province of Bourbonnais, in the centre of France. The first member of the family recorded in history was Adhèmar, sire or lord of Bourbon, at the beginning of the 10th century, who traced his descent from the illustrious Charles Martel. After several changes the seignior of Bourbon devolved upon an heiress, who in 1272 married Robert, the sixth son of Louis IX. of France, and the name and possessions of the house thus passed to a branch of the royal family of the Capets, under whom it was converted into a duchy. From this Robert sprang two lines, an elder and a younger. The elder line had many eminent representatives among the nobles of France, but ended with the famous Constable of Bourbon, who in 1523 was deprived of his possessions and dignities for allying himself with Charles V. against his own country.

A representative of the younger line inherited the possessions of the Constable, and was raised to the dukedom of Vendôme. His son, Antoine, obtained by marriage the throne of Navarre, and Antoine's son was the famous Henry of Navarre, who in 1589, on the extinction of the male line of

the House of Valois, fell heir to the crown of France. Among the many collateral and less eminent branches of the Bourbon house among the French nobility may be mentioned those of Montpensier, Condé, Conti, and Soissons. Only a few members of the collateral lines, however, have actually borne the name of Bourbon; for example, the Cardinal Charles de Bourbon, Duke of Vendôme, who, under the name of Charles X., was set up by the Catholic League as a rival king to Henry IV. The ducal dignity was revived by Louis XIV. in the House of Condé, so that the eldest son of that house should bear the title of Duke of Bourbon.

Main Line of the House of Bourbon.—As we have seen, the male line of the Valois branch of the French royal family died out in 1589, and Henry of Navarre of the Bourbon line became king of France as Henry IV. On his assassination in 1610 he left, by his second wife, Mary de' Medici, five legitimate children: (1) Louis XIII. (q.v.), his successor on the throne; (2) J. B. Gaston, Duke of Orleans (q.v.), who died in 1660, and left no male heirs; (3) Elizabeth, married to Philip IV. of Spain; (4) Christina, married to Victor Amadeus, afterwards Duke of Savoy; (5) Henriette, married to Charles I. of England.—Louis XIII., on his death in 1643, left two sons by his queen, Anne of Austria: (1) Louis XIV. (q.v.), his successor; and (2) Philip, who received from his elder brother the title of Duke of Orleans, and was the founder of the family which has become the younger Bourbon dynasty.—The Dauphin Louis, styled Monsieur, the son of Louis XIV. by his marriage with Maria Theresa of Austria, died in 1711, and left three sons by his marriage with Maria Anna of Bavaria: (1) Louis, Duke of Burgundy; (2) Philip, Duke of Anjou, who afterwards became king of Spain, as Philip V.; (3) Charles, Duke of Berri, who died in 1714.—Louis, Duke of Burgundy, died in 1712. By his wife, Maria Adelaide of Savoy, he had three sons, of whom two died in early youth, the only one who survived being Louis XV., who succeeded his great-grandfather, Louis XIV., in 1715.—Louis XV. having married Maria Leszcynska, daughter of the dethroned king Stanislaus of Poland, had by her a son, the Dauphin Louis, who married Maria Josepha of Saxony, and died in 1765, leaving three sons: (1) Louis XVI. (q.v.), who succeeded his grandfather, Louis XV., in 1774; (2) Louis Stanislaus Xavier, Count of Provence, afterwards Louis XVIII.; (3) Charles Philippe, Count of Artois, afterwards Charles X.—Louis XVI. had three children by his queen, Marie Antoinette of Austria: (1) The Dauphin Louis, who died in 1789; (2) Louis, called Louis XVII. (q.v.), who died in 1795; (3) Maria Therese Charlotte, styled Madame Royale, afterwards Duchesse d'Angoulême (q.v.).—Louis XVIII. had no children; but Charles X. had two sons: (1) Louis Antoine de Bourbon, Duke of Angoulême (q.v.), who was dauphin prior to the Revolution of 1830, and died without issue in 1844; (2) Charles Ferdinand, Duke of Berri (q.v.), who was assassinated in 1820. The Duke of Berri left two children: (1) Marie Louise Therese, styled Mademoiselle d'Artois, married to the Duke of Parma; (2) Henry Charles Ferdinand Marie Dieudonné, Duke of Bordeaux, styled Count de Chambord (q.v.); he died childless in 1883, when the Legitimists of France accepted in his room the Orleanist Comte de Paris as head of the House. See **Robinet de Cléry**, *Les Deux Fusions* (1908).

Orleans Branch.—As already stated, the founder of the Orleans or younger branch of the Bourbon royal family of France, was Philip, Duke of Orleans (q.v.), the only brother of Louis XIV. He died in 1701, leaving, by his second marriage with Elizabeth Charlotte of the Palatinate, a son of his

own name as his heir, who was Regent of France during the minority of Louis XV. His son, Louis-Philippe, Duke of Orleans (born 1703), married a princess of Baden, and died in 1752, leaving an only son of his own name, whose son and heir was that Louis Joseph Philippe, Duke of Orleans (q.v.), so notable in the French Revolution, who in 1792 renounced his rank, taking the name of Citizen Égalité, and died by the guillotine in 1793. He left four children: (1) Louis-Philippe, who, before the Revolution, was styled Duke of Chartres—that being the ordinary title of the eldest son of the Orleans family—became afterwards Duke of Orleans, was king of the French from 1830 to 1848, and died in England, 1850; (2) the Duke de Montpensier, who died in England in 1807; (3) the Count de Beaujolais, who died at Malta in 1808; (4) Adelaide, styled Mademoiselle d'Orleans, born 1777, died 1847.—Louis-Philippe left a numerous family by his queen, Amelia of Naples; but his eldest son, Ferdinand, Duke of Orleans, lost his life by an accident in 1842, leaving by his wife, the Princess Helen of Mecklenburg-Schwerin, two sons, the eldest of whom, Louis-Philippe, styled Count of Paris, was at his death (1894) the representative of the Orleans family, and head of the House of Bourbon. His son Louis-Philippe Robert (1869–1926) was already known as Duke of Orleans. As pretenders to the throne, the chiefs of the Orleans family were expelled from France in 1887. See LOUIS-PHILIPPE, the articles on the kings of this family, the works quoted at FRANCE, and the family history by Coiffier de Moret (2 vols. 1824).

Spanish Branch.—The Spanish branch of the House of Bourbon was founded by Philip, Duke of Anjou, grandson of Louis XIV. He ascended the Spanish throne in 1700 as Philip V. Philip V. was succeeded on the Spanish throne by his son, Ferdinand VI., who died without issue in 1759, and the crown fell to his brother, Charles III., whose son and successor, Charles IV., was compelled to resign it in 1808 in favour of a successor nominated by Napoleon, and died at Naples in 1819. The two eldest sons of Charles IV. by his marriage with Maria Louisa of Parma were—(1)

Don Fernando, Prince of Asturias, who, after the overthrow of Napoleon, reigned as Ferdinand VII., whose eldest daughter was Isabella II., the mother of Alfonso XII.; (2) Don Carlos, who, on the death of his elder brother in 1833, became pretender to the Spanish throne (see CARLOS). Isabella II., who succeeded in 1833, was expelled in 1868; but the Bourbon line was in 1874 restored to the throne of Spain in the person of Alfonso XII. On his death in 1885 his daughter Maria reigned till the birth of a posthumous son, Alfonso XIII., in 1886. See SPAIN.

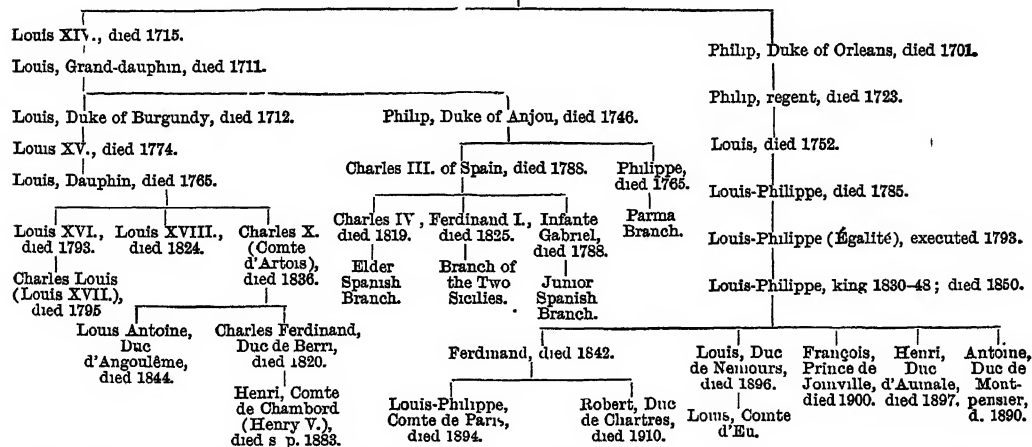

Neapolitan Branch.—On the elevation of Philip of Anjou to the throne of Spain, Naples and Sicily, which till that time had been Spanish possessions, were transferred to Austria. By the Peace of Vienna in 1738, however, a younger son of Philip V. became king of Naples and Sicily, under the name of Charles III. Upon his accession to the throne of Spain in 1759, he gave up that of Sicily to his third son, Don Fernando, called Ferdinand IV., with the express stipulation that it should never again be occupied by a king of Spain. Ferdinand IV. was compelled to yield to the French arms in 1806; but after the overthrow of Napoleon he became king of the Two Sicilies as Ferdinand I. (q.v.). His son, Francis I., left the throne in 1830 to his son, Ferdinand II. (q.v.), whose son, Francis II., was expelled in 1860, when Naples was incorporated with the new kingdom of Italy. See NAPLES.

Parmaese Branch.—By the peace of Aix-la-Chapelle in 1748, Austria made over the duchies of Parma and Piacenza to Don Philip, the youngest son of Philip V. of Spain. Except during the interval 1814–47, when the duchies were assigned to Marie Louise of Austria, second wife of the first Napoleon, Parma and Piacenza were under Bourbon rulers till 1859. In that year they were incorporated with the new kingdom of Italy. See ITALY and PARMA; and see Coiffier de Moret, *Histoire du Bourbonnais* (1828); Achaintre, *Histoire de la Maison de Bourbon* (1825); Bingham, *The Marriages of the Bourbons* (1889); also histories by Mure (Paris, 1860–68) and Dussieux (1869).

THE HOUSE OF BOURBON.

Henry IV., died 1610.

Louis XIII., died 1643.

Bourbon, CHARLES, DUC DU BOURBONNAIS, styled CONSTABLE DE BOURBON, born 1490, was the son of the Count of Montpensier. Through the death of his elder brother, and his marriage with the only daughter of the Duke of Bourbon, he united in his own hands the vast estates of both

these branches of the Bourbon family. His great ability, bravery, and large possessions soon made him the first subject of France. For his exploits at the battle of Marignano in 1515 he was raised to the rank of Constable of France and governor of Milan. But at the French court there was a strong

party that sought to undermine him in the favour of the king, Francis I. It is said that they were assisted in their intrigues by the widowed mother of Francis, because Bourbon, himself then a widower, had refused her hand. In this way Bourbon was threatened with the loss of the lands brought him by his wife, and of many of his other dignities. Deeply injured, he renounced the service of France, and concluded a private alliance with the Emperor Charles V., and with Henry VIII. of England. The former agreed to give him in marriage his sister, Eleonora, who had Portugal as her jointure, and to make an independent kingdom for him of Provence and Dauphiné, with his own possessions of the Bourbonnais and Auvergne. The king, who was engaged in an expedition to Italy, received intelligence of this conspiracy, and proceeding in person to the Constable, offered him restoration to favour and also of his estates. The Constable, however, did not trust him, but fled in disguise from France in 1523. In order not to appear as a fugitive to the Spanish army, which awaited him in Lombardy, he drew around him a force of German mercenaries, and soon contrived to gain their entire attachment. He took the field in 1524 against his own country, and invaded France, but failed at the siege of Marseilles. In the following year, however, he contributed to the great victory of Pavia, in which Francis I. was taken prisoner by the Spaniards. But the victory did nothing to restore Bourbon to his old position. Charles V. distrusted him, and his interests were not considered in the treaty of peace between France and Spain in 1526. He was, however, made Duke of Milan by Charles, and appointed Spanish commander in Northern Italy. Along with George of Frundsberg he led the mixed army of Spanish and German mercenaries that stormed and plundered Rome in 1527. Bourbon fell in the fierce struggle by which the fortifications were carried. Resolved to conquer or die, he led his troops in the most impetuous manner, and with his own hands eagerly seized a scaling-ladder, in order to make his way over a weak place of the walls, when he was mortally wounded by a bullet, which Benvenuto Cellini afterwards asserted that he had shot. For a time his death was kept secret from the storming army under his command. When the army departed from Rome two months after, his corpse, which the soldiers would not part with, was taken with them, and buried at Gaeta, under a magnificent monument, which, however, was afterwards destroyed.

Bourbon, ISLE DE. See RÉUNION.

Bourbonnais, a gently undulating, terrace-formed district in the centre of France, northward of the high lands of Auvergne, abounding in grain, fruits, wine, iron, marble, and mineral springs. From 1327 to 1523 it formed the duchy of Bourbon, and afterwards, becoming a domain of the crown, it formed a separate province of France. It now constitutes the department of Allier and part of the department of Cher. The capital was Moulins.

Bourbonne-les-Bains, a town in the French department of Haute-Marne, 29 miles ENE. of Langres. From June to October it is much visited for its saline springs, which reach a temperature of over 130° F., and are efficacious for rheumatism, wounds, scrofulous affections, and digestive ailments.

Bourboule, a bathing-resort in the French department of Puy de Dôme, on the Dordogne, with springs of 88°-129° F., recommended in scrofulous, nervous, and rheumatic affections.

Bourdaloue, LOUIS, one of the greatest pulpit orators of France, was born at Bourges, 20th August 1632. At sixteen he entered the

order of the Jesuits, and afterwards filled in succession the chairs of Rhetoric, Philosophy, and Moral Theology in the Jesuit College of his native place. But his remarkable powers of eloquence determined his superiors to employ him as a preacher. Disdaining the inflated and theatrical style prevalent among the pulpit orators of his time, he assailed with fearless vigour and simple earnestness the passions, weaknesses, and errors of men. The dignity of his manner and the fire of his eloquence made him famous even when the public mind was occupied with the festivities of Versailles, the victories of Turenne, and the literary masterpieces of Corneille and Racine. At the court of Louis XIV. he was remarkably well received. The year after the revocation of the Edict of Nantes, he was sent to Montpellier to bring back the Protestants to the Roman Catholic Church. The orator understood how to accommodate his eloquence to the minds of those whom he addressed. Simple among the simple, a dialectician among ecclesiastics, he was equally a favourite with the common people and with the learned and the great. He was also much esteemed and beloved as a man, and bore throughout his life a high reputation for candour and honesty. In the later years of his life he relinquished the pulpit, and devoted his time to hospitals, prisons, and pious institutions. He died at Paris, 13th May 1704. The best edition of his sermons was edited by Bretonneau (16 vols. 1704-37). See books by Lauras (1831), Feugère (1838), Chérot (1898-99), Griselle (1901), and Castets (1901-4).

Bourdon de l'Oise, FRANÇOIS LOUIS, was born in the middle of the 18th century at Saint Remy, near Compiègne. He was a fanatical revolutionist, took an active part in the storming of the Tuileries on 10th August 1792, and under a false name obtained a seat in the Convention. Bourdon contributed to bring about the execution of Louis XVI. and the destruction of the Girondists. In La Vendée, however, he objected to the cruelties of the extreme party, and thus became suspected by the followers of Robespierre, whom he helped to overthrow in 1794. From that time he inclined more and more to the moderate or even royalist party, till in 1797 the Directory had him proscribed and transported to Cayenne, where he died soon afterwards. See Thiers, *Histoire de la Révolution*.

Bourgas. See BURGAS.

Bourgelat, CLAUDE, veterinary surgeon, was born in Lyons in 1712, and died there in 1799. An ex-cavalry officer, he in 1761 founded (at Lyons) the first veterinary school, and students flocked to it from all parts of Europe. Its success induced the government to establish similar institutions, and Bourgelat was chosen to superintend that at Alfort, near Paris, which became the most celebrated school in France. Bourgelat wrote with authority on farriery.

Bourg-en-Bresse, the chief town of the French department of Ain, on the Reyssouze, at the junction of five railways, 23 miles SE. of Mâcon, and 37 miles NE. of Lyons. The church of Notre dame de Brou here was built by Margaret of Austria in 1505-36, and contains a superb monument to Philibert of Savoy. Bourg manufactures artificial mineral waters, boilers, and pottery, and has a brisk trade in corn, wine, poultry, and horned cattle. Here were born Lalande and Edgar Quinet, and in the Place de Grenette stands a statue to Bichat. Pop. 20,000.

Bourgeoisie, a French term, originally denoting the citizens of towns as a rank or class of society as opposed to the nobility and the working-classes proper. The French communists and socialists (especially since Saint-Simon) have

widened its signification to express the more or less comfortable middle-class as opposed to the working-class and the proletariat; and, moreover, invariably read into the name a one-sided, narrow-hearted, and selfish devotion to the interest of capital as against labour.

Bourges, the capital of the French department of Cher, situated in a fertile plain at the confluence of the Auron and the Yèvre, 144 miles S. of Paris, and 69 SSE. of Orleans. Bourges is divided into an old and new town, the latter being built round the former. Its houses are of antique architecture, and its streets crooked and dirty. It was formerly surrounded by ramparts flanked with high towers, some of which still remain; but the ramparts have been converted into promenades. The cathedral (1220-1538) is a splendid Gothic edifice, the interior one of the noblest in France, being 405 feet long and 117 high. The sculptures of the west façade are admirable, and there is some very good stained glass. A university (1465) was suppressed at the Revolution. The hôtel-de-ville, formerly Jacques Cœur's house (c. 1443), is in the florid style of its century. Bourges has prospered since the era of railway communication, and has some trade in hemp, grain, cloth, leather, wool, and cattle. Brewing is carried on, and there are nurseries in the suburbs. Chosen in 1861 to be one of the military arsenals of France, Bourges has a cannon-foundry, and greatly increased in importance after the loss of Metz. Pop (1872) 27,377; (1911) 45,735; (1921) 45,942. Bourges is of great antiquity, being the *Avaricum* of the Gauls, in the country of the *Bituriges Cubi*. Taken by Cæsar in 52 B.C., it became the capital of the Roman province of *Aquitania Prima*, and in the middle ages, of the province of Berri. Charles VII. had his residence at Bourges, when almost all France had been taken from him by the English. Louis XI. was a native, as was also the great preacher Bourdaloue. Several important ecclesiastical synods were held at Bourges.

Bourget, LAC DU, the largest wholly French lake, in the department of Savoie and the basin of the Rhone, lies 780 feet above sea-level, and measuring $7\frac{1}{2}$ by 3 miles, has an area of 16 sq. m.

Bourget, LE, a village $6\frac{1}{4}$ miles NE. of Paris, with an important aerodrome. During the siege of Paris in 1870 several bloody struggles disastrous to the French took place here, the most important those of 30th October and 21st December.

Bourget, PAUL, an eminent novelist and critic, born at Amiens, September 2, 1852. After a brilliant course at the Lycée of Clermont-Ferrand, where his father was professor of Mathematics, and the college of Sainte Barbe, he graduated with the highest honours in 1872. His early distinctions pointed to an academical career, but the spell of literature proved too strong. He began to write in 1873, but it was ten years ere he found his true work, though he contributed the while numerous articles to the magazines, and published as many as three volumes of striking verse: *La Vie Inquiète* (1875), *Édels* (1878), and *Les Aveux* (1881). His *Essais* (1883) was the first indication of his strength. The second series, *Nouveaux Essais de Psychologie contemporaine* (1886), was a singularly subtle and searching inquiry into the causes of pessimism in contemporary France. Bourget's first novel, *L'Irréparable* (1884), was followed by *Cruelle Enigme* (1885), *Un Crime d'Amour* (1886), *André Cornélis* (1887), and *Mensonges* (1887). The keen insight into the hidden springs of human motive, and the marvellous subtlety of psychological analysis in these stories, together with their clearness and refinement of style, have lifted Bourget into the front rank of contemporary French novelists. His intimate knowledge of English and

Italian life, and his travels in Spain and Morocco, gave him the materials for *Sensations d'Italie* (1891) and *Cosmopolis* (1892); and he recorded his impressions (1894) of travel in the United States. His works include *Le Disciple*, *Notre Cœur*, *La Terre Promise*, *Un Saint*, *Un Scrupule*, *Un Idylle Tragique*, *Voyageuses*, *Recommencements*, *Complications Sentimentales*, *La Duchesse Bleue*, *Drames de Famille*, *Le Fantôme*, *Monique*, *L'Étape*, *Un Divorce*, *Le Démon de Midi*, *Lazarine*, *Anomalies*, *Nouvelles Pages de Critique et de Doctrine* (1922)—the later works written from a Roman Catholic point of view. He was admitted to the Academy in 1894.

Bourignon, ANTOINETTE, a celebrated religious visionary, born at Lille, 13th January 1616. She early fancied she saw visions, received special revelations, and was called to restore the pure spirit of the gospel. At twenty she fled to a convent. She afterwards had charge of a hospital at Lille, but from this position she was driven to Ghent (1662) in consequence of her extravagant fancies. She now travelled to gain proselytes, and for a time was head of a hospital in East Friesland. She died at Franeker, 30th October 1680. According to Madame Bourignon, religion consists in internal emotion, and not in either knowledge or practice. Her own character exhibited a strange combination of pride and avarice, with a sort of mystic piety. Among the chief expounders of Bourignonism, as this form of mysticism was called, was Peter Poiret, a Calvinistic minister. It spread to a remarkable extent, and about the beginning of the 18th century prevailed so much in Scotland that till 1809 a renunciation of it was demanded from every entrant on the ministry at his ordination. The works of Madame Bourignon were edited by Poiret (25 vols. Amsterdam, 1676-84; 2d ed. 1717). There are English translations of her *Light of the World* (1786), *Treatise of Solid Virtue* (1699), and *Restoration of the Gospel Spirit* (1707). See a monograph on her by Professor A. R. MacEwen (1909).

Bourmont, LOUIS DE GHAISNES, COMTE DE, a French marshal, the conqueror of Algiers, was born in 1773 at his paternal castle of Bourmont, in Anjou. He went into exile at the Revolution, and from 1794 to 1799 was actively engaged in the anti-revolutionary struggle in La Vendée. Subsequently, he obtained the favour of Napoleon, and for his brilliant services in the campaigns of 1813-14 was promoted to the rank of general. In March 1814 he declared for the Bourbons; yet, on Napoleon's return from Elba, he went over to him, only once more to desert on the eve of the battle of Ligny, and to betake himself to Louis XVIII. at Ghent. His evidence went far to bring about Ney's execution. He was appointed minister of war in 1829, and in 1830 received the command of the expedition against Algiers, whose rapid success was ascribed to his prudence and energy. For this he received the marshal's baton, but on the July revolution he was superseded, and went to England to share the exile of Charles X. Refusing to take the legal oath, he was struck off the lists of the French army and peerage in 1832. In 1833 Dom Miguel of Portugal placed him at the head of his troops, but the campaign was brief and unsuccessful. Bourmont finally settled on his estate in Anjou, and died there 27th October 1846.

Bourne, HUGH, the founder of the sect of Primitive Methodists (q.v.), was born 3d April 1772, at Fordhays, parish of Stoke-upon-Trent, Staffordshire, and died at Bemersley, 11th October 1852. At first an assistant to his father, who was a farmer and wheelwright, and to an uncle, he became a preacher among the Wesleyan Methodists. His zeal for large open-air meetings, carried on on

one occasion from six in the morning till eight at night, received no countenance from the leaders of the denomination to which he belonged; and in 1808 Bourne was cut off from the Wesleyan connection for continuing to hold camp meetings in defiance of the repeatedly and strongly expressed disapproval of the Wesleyan Conference. But his preaching was wonderfully acceptable, and he quickly gathered round him many devoted adherents. In March 1810 a committee of ten members was formed at Standley, near Bemersley. This may be regarded as the first official organisation of the body which adopted the name Primitive Methodist in 1812; by the people they were sometimes called Ranters. Bourne and his brother founded the first chapel of the body at Tunstall in 1811. For the greater part of his life he worked as a carpenter and builder, but found time to visit Scotland, Ireland, and the United States. Amongst his writings was a *History of the Primitive Methodists* (1823).

Bourne, VINCENT, Latin poet, was born in 1695, from Westminster passed in 1714 to Trinity College, Cambridge, and after obtaining a fellowship in 1720, became a master in his old school. Such he remained till his death on 2d December 1747. Cowper, one of his pupils, expressed his 'love for the memory of Vinny Bourne,' and actually thought him 'a better Latin poet than Tibullus, Propertius, Ausonius, or any of the writers in his way except Ovid, and not at all inferior to him.' And Lamb, more happily, remarks: 'What a sweet, unpretending, pretty-mannered, matterful creature! Sucking from every flower, making a flower of everything. His diction all Latin, and his thoughts all English!' The best edition of his *Poemata* (1734) is that with a memoir by Mitford (1840).

Bournemouth, a town in Hampshire, a favourite health resort, on Poole Bay, 37 miles SW. of Southampton, and 116 of London. Its rise has been rapid; until 1838 it consisted of but a few fishermen's huts and a coastguard station. It is situated for the most part in the pine-clad valley of the Bourne Brook, the banks of which are laid out as public gardens. The sands extend for about 3 miles from east to west. The climate is fine, the air soft without being relaxing, and the country around is beautiful. Two piers, one 800, the other 840 feet long, were erected in 1861 and 1879. Of several churches the finest is St Peter's (1864), by Street, with memorial windows to Keble, and the graves, in its churchyard, of Godwin, Mary Wollstonecraft, and Mary Shelley. There are numerous sanatoriums, an art-gallery, a winter-garden, &c. Pop. (1861) 1940; (1881) 16,858; (1891) 37,650; (1901) 47,003; (1911) 78,674; and in 1921, 91,770. The town was made a municipal borough in 1890, and a county borough in 1900, a parliamentary borough in 1918. Its centenary was celebrated in 1910 (the first villa dating from 1810).

Bouroudjird, a town of Persia, 190 miles NW. of Isfahan; pop. 12,000.

Bourrienne, LOUIS ANTOINE FAUVELET DE, the secretary and early friend of Napoleon I., was born at Sens in 1769, and received his education in the military school at Brienne, where he formed the closest intimacy with the future emperor. In 1792 he became secretary to the embassy at Stuttgart. Deprived of this office through the breaking out of the revolutionary wars, he lived a retired life for some time, until in 1797 his former schoolfellow appointed him his secretary. He accompanied him to Italy and to Egypt, and in 1801 was nominated a councillor of state. In 1802 he was dismissed from his office for being implicated in the dishonourable bankruptcy of the house of Coulon, army contractors; but in 1804

he was appointed to a post at Hamburg. He was recalled on a charge of peculation, and had to refund 1,000,000 francs into the public treasury. He now decidedly joined the party which sought the overthrow of the emperor and the restoration of the Bourbons. After the return of the Bourbons in 1815, he sat for several years in the Chamber of Representatives, where he figured as an opponent of Liberalism. He was also for a short time minister of state. The revolution of 1830 and the loss of his fortune (occasioned by extravagance) caused his reason to give way, and he died in a lunatic asylum at Caen in 1834. His venomous memoirs on Napoleon, the Directory, the Consulate, the Empire, and the Restoration (10 vols. 1829; new ed. 1899-1900) are maintained by Augustin Thierry to be almost entirely the work of Villemarest (*Les Grandes Mystifications*, 1911).

Bourse. See EXCHANGE.

Boussa, or BUSSONG, familiar by name in Europe as the scene of Mungo Park's death in 1803, is a town (pop. 13,000) on an island in the Niger, in the north-western part of Nigeria. It is not commercially important.

Boussingault, JEAN BAPTISTE, a French agricultural chemist, was born at Paris in 1802, and after a visit to South America, where he served as a colonel under Bolivar, became professor of Chemistry at Lyons, in 1839 was admitted into the Institute, and in 1857 was made commander of the Legion of Honour. His *Economie Rurale* (1844; Eng. trans. 1845) embodies the investigations which made him famous. Of four or five other works the most important is *Agronomie, Chimie agricole, et Physiologie* (7 vols. 1860-84). He died 12th May 1887.

Boustrophe'don. See ALPHABET.

Bouterwek, FRIEDRICH (1765-1828), born at Oker, near Goslar, held a chair of Philosophy at Gottingen, and, at first a Kantian, attached himself to the system of Jacobi. He wrote a famous history of modern European poetry and eloquence.

Boutroux, ÉMILE (1845-1921), author of *De la Contingence des Lois de la Nature* (1879), was born at Montrouge. He wrote much on ethical questions, on the history of philosophy, on science and religion, on Leibniz, on Pascal, on William James. He became a professor in the university of Paris in 1888, a member of the Institute in 1898, of the Academy in 1912, and delivered the Gifford Lectures at Glasgow in 1908.

Bouts-rimés (Fr., 'rhymed endings') are a kind of verse, the making of which forms a social amusement. Some one of the party gives out the rhymes or endings of a stanza, and the others have to fill up the lines as they best may. Suppose the rhymes prescribed are *wave, lie; brave, die*; the following are two of the ways in which the lines might be completed:

Dark are the secrets of the gulping	wave,
Where, wrapped in death, so many heroes	lie;
Yet glorious death's the guerdon of the	brave,
And those who bravely live can bravely	die
Whenever I sail on the	wave,
O'ercome with sea-sickness I	lie;
I can sing of the sea, and look	brave;
When I feel it, I feel like to	die.

These were once very popular, especially in France, and endless ingenuity was wasted on 'this foolish kind of wit.' See No. 60 of the *Spectator*.

Boutwell, GEORGE SEWALL, an American statesman, born at Brookline, Massachusetts, 28th January 1818, was a member of the state legislature (1842-51), and governor of Massachusetts (1851 and 1852). Having joined the Republican party, in 1862 he organised the new department of internal revenue, and sat in congress from 1862 to 1869.

taking a leading part in the impeachment of President Johnson (1868). He was secretary of the treasury, 1869-73, and for two years after represented Massachusetts in the senate. Besides speeches, he published *Educational Topics and Institutions* (1858), and works on United States Taxes (1863 and 1865). He died in 1905.

Bouvardia, a Mexican genus of Rubiaceae, sub-order Cinchonaceae. *Bouvardia triphylla*, with oblong ternate leaves and beautiful corymbs of scarlet flowers produced from June to November, has obtained a place among the favourite ornaments of flower-bordeis in Britain, but requires careful protection from frost. To preserve it, the roots are generally taken up.

Bouvines, a village in the French department of Nord, 8 miles S.E. of Lille, the scene of the victory of Philip Augustus of France over the Emperor Otto IV. in 1214—commemorated by a monument (1863)—and of a series of struggles in 1794 between the Austrians under Kinsky and the victorious French army of the north.

Bovate (Lat. *bos*, 'ox') or OXGANG, an old English land-measure; as much as an ox can plough in a season—an area varying according to circumstances from 8 to 18, or sometimes even 24 acres. It was the eighth of a *carucate*.

Bovey Coal is a form of wood-coal or lignite, which derives its name from being found at Bovey, in Devonshire.

Bovidae, a family of even-toed, hollow-horned, ruminant, hoofed mammals (*Artiodactyla ruminantia*, *Cavicornia*). The sheep and antelope types form the other division of the same series. The Bovidae include the various varieties of ox (*Bos*), the buffalo (*Bubalus*), the Tibet ox (*Poephagus*), the bison, and perhaps also the more widely separated musk-ox (*Ovibos*). The limits or relative value of the different genera are somewhat doubtful, but there is no doubt that the distinctions between *Bos* and *Ovibos* are greater than those between *Bos* and any of the other genera or sub-genera. The term is sometimes used as equivalent to hollow-horned ruminants, but is here used (as equivalent to Bovinae) to include those that remain after subtracting the sheep and antelope types (*Ovina* and *Antelopina*). The large compact hairy body, the short strong legs, the usually smooth and round curved horns, the broad snout and naked nostrils, the undivided upper lip, the absence of tear-pits and hoof-glands, the frequent dewlap, the four teats, and the more general characters of the replacement of upper front teeth by a fibrous elastic pad, of characteristic canon-bones (fused metacarpals and metatarsals), of complex stomach and cud-chewing ruminant habit, are familiar to most. In their wild state they are gregarious nomadic animals, swift of foot, eating hurriedly, masticating and digesting at leisure. They feed on grass and herbage, which seem to be collected by the tongue, held by the lower teeth, upper lip, and fibrous pad, and half bitten, half torn away by a quick movement. The hollow horns, occurring on both sexes, are formed from the skin, and simply based on a process of the forehead (frontal) bone; they obviously serve as weapons both against foes and rival fellows. The ancient and ancestral *Bos primigenius*, the numerous wild species such as Banteng and Gaur, the abundant varieties of domesticated cattle, the Asiatic Buffalo (*Bubalus bubalus*), the giant Arni (*Bubalus arni*), the wild and also domesticated Tibetan Yak (*Poephagus grunniens*), the ancient and still extant European Bison (*B. europaeus*), the American Buffalo or Bison (*B. americanus*), are important forms in no way widely separated from the *Bos* type. But in

the Musk Ox (*Ovibos moschatus*) the very small naked portion of the snout and the short hair-covered tail are marked, though hardly important, differences. It is often included among the sheep and goats (*Ovina*). Altogether there are about thirteen modern species, widely distributed in Europe, Asia, Africa, and North America. Numerous fossil forms are known from the Pliocene upwards. The utility of these forms to man both in their wild and in their domesticated states, is too well known to require statement. The flesh, the fat, the milk, the hair, the skin, the viscera, bones, horns, dung, &c. are in common use, and the animals themselves have in many cases become beasts of burden. See CATTLE, and other separate articles.

Bovino, a cathedral city of South Italy, 20 miles S.S.W. of the town of Foggia. Pop. 8000. The Imperialists defeated the Spaniards here in 1734.

Bow of a ship is the general name for the stem and fore-part, or that which cuts the water. The word is often used in the plural, the ship being considered to have starboard and port bows, meeting at the stem. Starboard is applied to the right-hand side, and port to the left-hand side, looking forward. A fine or lean bow, and a full or broad bow, are seamen's phrases for different types; and the 'V form,' or 'U form,' is a nomenclature adopted by the naval architect to denote the character of a section of the bow. See SHIPBUILDING.

Bow and Arrow. See ARCHERY.

Bowdich, THOMAS EDWARD, African traveller, was born at Bristol 20th June 1791, for a year was a hatter in his native city, but in 1814 received a writership in the service of the African Company. Selected in 1816 to conduct a mission to the king of Ashanti, he succeeded in his difficult negotiation, and thus paved the way for commerce and the exploration of the interior. On his return to Europe (1818) he resided for some time in Paris, where he studied mathematics and other subjects to such purpose as to gain a valuable Cambridge prize. Aggrieved at his treatment by the African Company, he exposed their management in a volume which led the government to take over their possessions. In 1822 he sailed for Africa, and began a trigonometrical survey of the Gambia, where he died of fever, 16th January 1824. See his *Mission from Cape Coast Castle to Ashanti* (1819), and the narrative of his last voyage, edited by his wife (1825).

Bowditch, NATHANIEL, an American mathematician and astronomer, born 26th March 1773, at Salem, Massachusetts. He showed at a very early age a great inclination for mathematics, in which he afterwards made great proficiency without ever attending a university. He was at first bred to his father's trade of a cooper, and afterwards apprenticed to a ship-chandler. He acquired Latin that he might study Newton's *Principia*, and at a later period studied French, Spanish, Italian, and German. He particularly devoted himself to the study of the practical applications of science. Between 1795 and 1803 he acted in turn as clerk, supercargo, and master of a merchant-ship in five long voyages, and added a thorough practical acquaintance with navigation to a theoretical knowledge of it. His *New American Practical Navigator* (1802) was received with great favour. He published also an admirable translation of Laplace's *Mécanique Céleste* (1829-38), to which he added valuable annotations, and upon this achievement his fame chiefly rests. These works obtained for him marks of honour from scientific societies in Europe, and led to offers, which he declined, of the professorship of Mathematics and Astronomy in Harvard College (1808), the university of Virginia (1818), and

West Point (1820). In 1823 he became actuary of the Massachusetts Life Insurance Company, and was afterwards president of the Academy of Arts and Sciences in Boston, and a member of the corporation of Harvard College, from which he received the degree of LL.D. He died at Boston, 16th March 1838. See *Memoir* by his son (1839).

Bowdler, THOMAS, who has immortalised himself unhappily as the editor of the 'Family Shakespeare,' was born of wealthy parents at Ashley, near Bath, July 11, 1754. At sixteen, he went to St Andrews to study medicine, but graduated M.D. of Edinburgh in 1776, and after some years of travel, settled in London, devoting himself mainly to charitable work. He lived for ten years at St Boniface, Isle of Wight, and for the last fifteen years of his life at Rhyddings, near Swansea, where he died February 24, 1825. In 1818 Bowdler published 'The Family Shakespeare, in 10 vols.; in which nothing is added to the original text; but those words and expressions are omitted which cannot with propriety be read aloud in a family.' The work was long popular, and Swinburne praised the achievement, though 'bowdlerising' has become a synonym for superfluous expurgation. Ludovicus Vives had expurgated the classics, and Garrick 'bowdlerised' Shakespeare before Bowdler, who also prepared a purified edition of Gibbon's History (6 vols. 1826) under the title 'Gibbon's History of the Decline and Fall of the Roman Empire, for the use of Families and Young Persons, reprinted from the original text, with the careful omissions of all passages of an irreligious or immoral tendency.' In a note, the editor says that 'it was the peculiar happiness of the writer' to have so purged Shakespeare and Gibbon that they could no longer 'raise a blush on the cheek of modest innocence, nor plant a pang in the heart of the devout Christian.'

Bowdoin, JAMES, an American statesman, of Huguenot descent, born in Boston in 1727, graduated at Harvard in 1745, was elected to the Continental Congress in 1774, but was unable to attend, and in 1785-86 was governor of Massachusetts. He published scientific papers, poems, &c.; referred, in a letter to Benjamin Franklin, the phosphorescence of the sea to animalcules; was F.R.S., LL.D.; and in his honour Bowdoin College, at Brunswick (q.v.) in Maine, was named. He died in 1790.

Bowels. See ABDOMEN, COLIC, CONSTIPATION, DIARRHŒA, DIGESTION, DYSENTERY, ENTERITIS, HERNIA, INTUSSUSCEPTION, PERITONEUM, TAPEWORMS, &c.

Bowenite, a hard variety of serpentine, which has been confused with jade, and used in like manner.

Bower, or BOWMAKER, WALTER, frequently spoken of as 'the continuator of Fordun,' completed the history of Scotland which is known as the *Scotichronicon*, and which was begun by Fordun. Not much is known of Bower's personal history. We know from his own statement that he was born in 1385; and in the British Museum MS. of the *Scotichronicon*—which MS. is known as *The Black Book of Paisley*—he is spoken of as 'the venerable father in Christ, Walter Bower, Abbot of the Monastery of St Columba.' This monastery was situated on the island of Inchcolm in the Firth of Forth. He died in 1449. Bower has been too much overlooked as one of the authors of the *Scotichronicon*, which is frequently quoted as if Fordun wrote the whole of it, whereas his share of the work, with the exception of certain further materials which he had collected, ends at the close of Book V. with the death of David I. (1153). Bower continued the history to the death of James I. (1437),

and as he was contemporary with the later events which he describes, he is for this period entitled to be regarded as an independent historian. Like Fordun, he wrote in Latin. The only edition of his history is that printed by Walter Goodall, Edinburgh, in 1759, and no complete translation of it has yet appeared.

Bowerbankia, a common genus in the class of Bryozoa or Polyzoa. These are colonies of minute but highly organised animals, which used to be included among the hydroids or zoophytes, but are now unanimously placed at a much higher level. *B. imbricata* is one of the commonest British coast forms. It grows on seaweeds, corallines, stones, &c., between high and low water mark, or in no great depth of water, and forms branching tufts sometimes 1½ inch in height. The branches are smooth and transparent, and bear numerous individual animals of microscopic size. The genus is named after James Scott Bowerbank (1797-1877), who wrote a famous monograph on the British Spongiadae (1864). See POLYZOA.

Bower-bird, a name given to certain Australian birds, probably in the great family of Timeliinae, or babbling thrushes, remarkable for their habit of making bower-like erections, called *runs* by the colonists of New South Wales, and for adorning them with gay feathers, rags, bones,

The Spotted Bower-bird (from Brehm).

shells, and such other white or brightly coloured objects as they can pick up. These bowers are not used as nests, but they appear to be places of much resort at the breeding-season in particular. Their structure has been carefully examined, and fine specimens of them, transported with no little difficulty, were deposited in the British Museum by Gould, in whose magnificent work on the *Birds of Australia* (1848) a full account of them was first given to the world. The bowers of the Satin Bower-bird (*Ptilonorhynchus holosericeus*) are built among the low branches of some tree, and appear to be repaired and frequented from year to year. The base consists of an extensive and rather convex platform of sticks, firmly interwoven, on the centre of which the bower itself is built of more flexible twigs. It is chiefly at and near the entrance that the shells, feathers, &c. employed for decoration are placed. The bowers of the Spotted Bower-bird (*Chlamydochroa maculata*) are longer and more avenue-like than those of the satin bower-bird; they are placed upon the ground, are outwardly built of twigs, and beautifully lined with tall grasses so disposed that their heads nearly meet. The decorative propensity appears in the highest degree in this species. 'In some of the larger

bowels, which had evidently been resorted to for many years,' Gould says, 'I have seen nearly half a bushel of bones, shells, &c. at each of the entrances.' These are arranged in much the same way at both entrances. Small pebbles are often transported by the birds from considerable distances.

The satin bower-bird is particularly abundant in the mountainous districts of the west of New South Wales, and is found in all the 'brushes' from the mountains to the coast. The adult male has the whole plumage of a deep, shining black. The colours of the female are grayish green and brown, curiously mingled.—The Spotted Bower-bird, which is rather smaller than the satin bower-bird, or about the size of a starling, has a general colour of rich brown, beautifully marked with black and buff; a band of elongated feathers of light rose-pink crosses the back of the neck, and forms a broad, fan-like, occipital crest. It is restricted exclusively to the interior of Australia.—The Regent-bird (*Sericulus melinus*) has also been shown to form bowers. Mr Coxen, an Australian ornithologist, to whom many interesting observations on bower-birds are due, has described the love-tent of the regent-bird. It is less dome-shaped and smaller than that of the satin bower-bird, and appears to be wholly adorned with snail-shells. The use of such elaborate contrivances in the process of courtship, and the possession of such obvious æsthetic tastes, are circumstances of great interest in estimating the height of development reached by birds.

Bowie-knife, an American hunting dagger, named after its inventor, Colonel Jim Bowie, who, born about 1790, fell at Fort Alamo in the Texan war (1836). In a great *melée* near Natchez (1827), in which six men were killed and fifteen wounded, the colonel despatched an opponent with a knife made out of a blacksmith's rasp or big file; and this knife he afterwards had fashioned at Philadelphia into the weapon with which his name is associated. Its curved, double-edged blade is 10 to 15 inches long, and above an inch wide.

Bowles, CAROLINE. See SOUTHEY.

Bowles, WILLIAM LISLE, D.D., poet, was born 24th September 1762, at King's Sutton, in Northamptonshire, where his father was vicar. Educated at Winchester School and at Trinity College, Oxford, in 1804 he became a prebendary of Salisbury Cathedral and rector of Bremhill, in Wiltshire. Here he spent in easy circumstances the rest of his long life, dying at Salisbury, 7th April 1850. His earliest publication, *Fourteen Sonnets, written chiefly on Picturesque Spots during a Journey* (1789), was received with extraordinary favour; the contents of the little volume were fresh and natural, all the more charming because of the contrast they offered to the style of poetry which had long been in vogue. Coleridge, Wordsworth, and Southey were among their enthusiastic admirers; and through his influence over them, Bowles may be looked on as the founder of a school of English poetry in which his own name was soon eclipsed by theirs. Of his subsequent poetical works (14 vols. 1789–1837) the longest is *The Spirit of Discovery*, and the best, perhaps, *The Missionary*. As a poet Bowles shows a fine appreciation of the beauties of nature, and pleases by the expression of pure and generous sentiment, as well as by the playfulness of fancy and perfect scholarly correctness; but he is deficient in vigour and depth. In 1807 he published an edition of Pope, and an opinion which he expressed on Pope's poetical merits led to a rather memorable controversy (1809–25) in which Campbell and Byron were his antagonists, and which turned chiefly upon the comparative

value in poetry of images derived from nature and those derived from art. Of his prose writings may be mentioned a rather dry *Life of Bishop Ken* (2 vols. 1830). See the Memoir by Gilfillan prefixed to his collected poems (Edin. 1855).

Bowling, a Dumbartonshire village, on the Clyde, $\frac{3}{4}$ miles ESE. of Dumbarton.

Bowling Green, a city of Kentucky, capital of Warren county, on the Barren River, 114 miles S. by W. of Louisville by rail; pop. 10,000.—There is another city of the same name, capital of Wood county, Ohio; pop. 6000.

Bowls, or BOWLING, is an English pastime of undoubted antiquity. Strutt in his *Sports and Pastimes* reproduces a picture of two men playing a game with bowls from a MS. of the 13th century (Royal Library), and another from a MS. of the 14th century, representing three men bowling at a 'jack,' very much as the game is now practised, except that the players have only one bowl apiece.

It seems to be a doubtful point whether the ancient game was played in the open air or in closed alleys, or both; or whether, perhaps, there may not have always been two varieties of the game, one the outdoor game as we now know it, and an undercover game of bowling at pins. There is no doubt that, in the 15th and 16th centuries, *bowling-alleys* were not only very numerous, especially in the city and suburbs of London, but also became public nuisances on account of the gambling and dissipation carried on in connection with them. In the reign of Edward IV. a stringent act was passed forbidding any one to play at, among other games, *half-bowl*, either in 'house, tenement, garden, or other place,' on account of players being induced to play 'till they be utterly undone and impoverished of their goods.' This game of half-bowl is described by Strutt as still being played in Hertfordshire in his day (1801); fifteen small pins were bowled at with half of a sphere of wood, hence the name.

The name *bowls* first occurs in several acts passed by Henry VIII., who prohibited any person or persons, 'for his or their gain, lucre, or living, to keep, have, hold, occupy, exercise, or maintain any common house, alley, or place of bowling.' In spite of these acts, however, the game continued to exist, as it was not till the reign of George II. that the gambling *alley* game, against which the denunciations of the law seem to have been directed, became, more or less, actually suppressed. From about the same time, however, the outdoor game spread with such rapidity, that before the close of the century it was almost universal all over England and Scotland. As now played, bowling affords recreation to thousands who are past the age for more strenuous exercise. And this not only in private greens. By the institution in many towns of public greens, where the somewhat heavy initial outlay is borne by the civic authorities, and where for a small charge a game may be enjoyed, the popularity of bowling has been widely extended.

The game itself is a very simple one. The requirements are a piece of fine *level* turf 40 to 60 yards square, surrounded by a shallow ditch, a pair of bowls for each player, and a small white ball or 'jack.' The green is usually sunk below the level of the surrounding ground. The bowls are made of *lignum-vitæ*, 6 to 7 inches in diameter, turned more or less oval, with one side a little rounder than the other. This gives a *bias* to the bowl, which rolls in a curved direction instead of straight.

The players are usually arranged into opposing sides of four each, although any number can play. The jack having been thrown by one of

the players to a distance of not less than 20 yards from one end of the green, the object of the combatants is to roll their bowls so as to lie as near the jack as possible. The bias gives scope for considerable skill in playing the bowl, as it may be made to curve in, either from the right or from the left, as may seem best in order to dodge round other bowls which may be in the way. When all the sixteen bowls have been played, a point is counted for every bowl belonging to one side which is nearer the jack than the nearest bowl of the other side. The jack is then thrown by the winning side to the other end of the green, another 'end' played as before, and so on till one side or the other becomes game; which may be any number mutually agreed on—usually 21 or 31. The game may also consist of so many ends to be played, the side counting most at the conclusion to be the winner. Each side appoints one of their number 'skip,' who has full authority to direct the play of the others of his side. The game is identical in principle with Curling (q.v.), except that in bowling the distance is always uncertain, never fixed. There are regularly appointed rules for playing the game, providing for such points as the jack being moved by a bowl, or being thrown into the ditch, and many other details.

Another form of bowls, widely played in the midland and northern counties of England and confined almost solely to those parts, is known as the 'crown-green' game. In main object it corresponds to the 'level' or 'flat-green' game as above described, but conditions of performance vary. The green, according to its size, falls roundly from the centre to the sides by sometimes as much as eighteen inches; bowls of little or no bias are used; the jack may be thrown in any direction.

Bowling is also the name applied to a game of ten pins introduced from the United States. It is evidently either an improved variety of the English Skittles (q.v.), or a revival of a game called *long-bowling* or Dutch rubbers, which was played in England about the middle of the 18th century, and was exactly like the American game, except that nine pins were used. This game of long-bowls again was obviously either a development of the ancient half-bowl or similar game of bowls and pins, or a bodily introduction of the Dutch game of ninepins as played by 'Rip Van Winkle.' The game is becoming common in this country, where, in the suburbs of almost every large town, the 'American Bowling Alley' is a popular resort of the youth of the district. It is played in a covered alley on a prepared board 60 feet long by 4 feet wide. In America the board is slightly convex in the centre, and bevelled to the sides. The ten pins, usually of ash, and about 1 foot high,

are arranged as in the figure. Each player in turn rolls three bowls from the other end of the board, trying to knock over as many pins as possible. If he knocks all the ten down before he exhausts his three throws, he is entitled to get them set up again to complete his turn. He may even knock all the pins down with each of his three bowls, in which case he scores the maximum for his turn, 30, being one for each pin down. The other players then have their turn. A game consists of three or more such turns of three bowls for each player; he who knocks over most pins being the winner. The bowls are usually made of lignum-vitæ, are round, and of unlimited size, generally varying from $\frac{1}{2}$ a lb. to 5 or 6 lb. in weight. Such is the principle of the game, but in practice a complicated method of scoring exists. When a player knocks all the pins down with one or two bowls, he has what

is called a 'spare' or a 'double spare'—i.e. he has one shot or two shots, as the case may be, to spare. To save time he does not get the pins put up again immediately, but waits for his next turn, when, in the case of a 'spare,' his first shot, and of a 'double,' his first two shots are counted double—viz. once for the spares of the turn before, and once for the current turn. He may even have another double or single spare, when the scoring is carried over into the third turn, and so on. In the last turn of the game, however, the spares must be played off at once. This game is undoubtedly good exercise, but it has the drawback of not being played in the open air. It is run most often in connection with public-houses. See Manson, *The Complete Bowler* (1912). For bowling in cricket, see CRICKET.

Bowman, SIR WILLIAM, oculist, was born in Nantwich, 20th July 1816, studied chiefly in London, where he commenced practice as a surgeon, and became curator of the Anatomical Museum. In conjunction with Todd he published the *Anatomy and Physiology of Man* (5 vols. 1845-56), and gained reputation as an oculist by his *Lectures on Operations on the Eye* (1849). He was professor of Physiology at King's College, London (1845-55), F.R.S., LL.D., and a baronet (1884). He died 29th March 1892, and his *Collected Papers* (2 vols.) were published the same year.

Bowness, a town of Westmorland, on the east side of Windermere, 8 miles NW. of Kendal, since 1905 part of Windermere urban district.

Bowring, SIR JOHN, born in Exeter in 1792, on leaving school entered a merchant's office, and there pursued that course of polyglot study whereby, as he afterwards boasted, he knew two hundred, and could speak a hundred, languages. The national poetry of different peoples had special attractions for him, and he rendered great service to literature by translating both the more ancient and the more modern popular poems of almost all the countries of Europe. In 1821 he formed a close friendship with Jeremy Bentham, and in 1824 became the first editor of his radical *Westminster Review*, to which, as beseeemed the descendant of an old Puritan stock, he contributed many articles on freedom in religion and politics, as well as on literary subjects. In 1828 he visited Holland; and his *Sketch of the Language and Literature of Holland* (1829) procured for him the degree of Doctor of Laws from the university of Groningen. Subsequent travels were undertaken by him, on a commission from the British government, to inquire into the commercial relations of certain states. He visited Switzerland, Italy, Egypt, Syria, and finally the countries of the German Zollverein, and everywhere found materials for valuable reports. He sat in parliament for Kilmarnock from 1835 to 1837, for Bolton from 1841 to 1849, and actively promoted the adoption of free trade. In 1849 he was appointed British consul at Hong-Kong, and superintendent of trade in China. He returned in 1853, and in the following year was knighted and made governor of Hong-Kong. In 1856, an insult having been offered to a Chinese pirate bearing the British flag (the 'affair of the lorcha *Arrow*'), Bowring, without consulting the home government, ordered the bombardment of Canton, a proceeding which excited grave dissatisfaction at home, and nearly upset the Palmerston ministry. In 1855 he concluded a commercial treaty with Siam, in 1858 made a tour through the Philippine Islands; and his accounts of those two visits are about the most readable of his thirty-six works. He retired with a pension in 1859, and died at Claremont, Exeter, 23d November 1872. See his *Autobiographical Reminiscences* (1877).

Bowsprit is a strong boom or spar projecting over the stemhead or bows of a sailing-ship, and also of a steamship when the stem of the latter is of the curved or cut-water description. Its use is to support the jib-boom, a longer and lighter spar, forming a continuation of the bowsprit, which receives the lower ends of the foremast stay-ropes, on which sails are carried.

Bowstring, the string of a bow, is a name specifically used for an old Turkish mode of execution, the offender being strangled by means of a bowstring.

Bowstring Hemp, or *MOORVA*, is the fibre of a species of *Sansevieria* (especially *S. Zeylanica*), a plant of the natural order Liliaceæ (q.v.), tribe Hemerocallæ, used for making bowstrings in the East Indies. The fibre is hair-like and silky, elastic, and in strength apparently about equal to hemp. It does not rot in water so soon as hemp.—A very similar species (*S. guineensis*) is found in abundance on the west coast of Africa, and its fibre has been imported as African Bowstring Hemp.

Bow-window. See BAY-WINDOW.

Bowyer, SIR GEORGE, born in 1811 at Radley, near Oxford, in 1839 was called to the bar. Converted to Catholicism in 1850, he represented Dundalk 1852-68, and the county of Wexford 1874-80, when his Home Rule principles estranged him from the Liberal party, and in 1876 led to his expulsion from the Reform Club. He succeeded his father as seventh baronet in 1860, and died suddenly in London, 7th June 1883. He was author of several able works on constitutional law and Catholic subjects.

Bowyer, WILLIAM, an eminent English printer and classical scholar, born in London, 19th December 1699, was educated at Cambridge, and in 1722 joined his father, William Bowyer (1663-1737), in trade. Appointed in 1729 printer of the votes of the House of Commons, he subsequently became printer to the Society of Antiquaries and to the Royal Society. In 1767 he was nominated printer of the Rolls of the House of Lords and the Journals of the House of Commons. He died 18th November 1777. Bowyer published several philological tracts, edited several volumes of Swift's works, translated Rousseau's famous but paradoxical *Discourse* (1751), and wrote two essays on the *Origin of Printing* (1774); but his chief production was an edition of the New Testament in Greek with critical and emendatory notes.

Box (*Buxus*), a genus of Buxacæ or (Bentham and Hooker) Euphorbiacæ, evergreen shrubs or small trees, with greenish inconspicuous monocious flowers in little axillary spikes or fascicles. The Common Box (*B. sempervirens*) grows wild through South Europe, North Africa, North Asia to Japan, West Asia to West Himalaya. It is generally regarded as a true native of Surrey and the south of England, where it grows on dry chalky hills. In Britain, it seldom attains a height of more than 12 or 14 feet, though in warmer countries it is often twice that height, and though the three classic box-trees in Queen Mary's 'child-garden' at Inchmahome, in the Lake of Menteith, are 20½ feet high. The box is remarkable for its compact habit of growth and densely crowded branches and leaves, presenting a very solid mass of foliage, hence it bears clipping remarkably well; and in the old 'topiary' style of ornamental gardening it occupied an important place, being cut into architectural and fantastic figures. A dwarf variety is used for edging garden-plots, and different kinds are grown in our shrubberies. The bitter and purgative leaves are no longer official. The wood of the box is heavier than that of any other European

tree, and is the only European wood that sinks in water. It is of a beautiful pale-yellow colour, remarkably hard and strong, of a fine regular and compact texture, capable of a beautiful polish,

Branch of the Common Box (*Buxus sempervirens*).

and not liable to be worm-eaten. It is much valued for the purposes of the turner and the wood-carver; is preferred to every other kind of wood for the manufacture of flutes, flageolets, and other wind-instruments, as well as of mathematical instruments; and is unrivalled for wood-engraving, admitting of a finish as sharp and fine as metal, whilst it takes the ink much better (see ENGRAVING). The box of commerce comes mainly from Caucasia, Asia Minor, and Persia; but reckless destruction has made it scarce and dear. In 1815 as many box-trees were cut down at Box Hill, in Surrey, as brought upwards of £10,000; but the tree is of so very slow growth that it is seldom planted in Britain except for ornament.—The Minorca Box, or Balearic Box (*B. balearica*), a native of the Mediterranean countries, &c., is a larger tree than the common box. The wood is of a bright yellow, and inferior to the true boxwood, but is brought in large quantities from Constantinople under that name. The South African Box (*B. Macowanii*) is very suitable for engraving.

Box-days. These are days appointed by the Court of Session in Scotland, in the vacations and Christmas recess, on which pleadings or other law-papers may be lodged or filed, the object being to expedite the procedure, notwithstanding the vacation or recess. The name is derived from the fact that all printed papers in the Court of Session must be placed in boxes, one for each judge, for each legal society, and for the reporters. These boxes were introduced in 1690 to avoid the evil of private solicitation of judges.

Boxers, a Chinese secret society ('The Fist of Righteous Harmony'), whose movement against foreigners and foreign influences culminated in the siege of the legations in Peking, and their relief by an international force in 1900. See CHINA.

Box-hauling is a mode of turning a ship when the swell of the sea renders tacking impossible, or when the ship is too near the shore to allow room for veering. The operation is effected by hauling the head-sheets to windward, bracing the head-yards aback, and squaring the after-yards, the helm at the same time being put alee. *Boxing-off* is a very similar operation.

Boxing. See PUGILISM.

Boxing-day, the day after Christmas (q.v.), so called in England from being the day on which *Christmas-boxes*, or presents, are given.

Boxtel, a town in the Dutch province of North Brabant, 38 miles S. by E. of Utrecht. An Anglo-Dutch army, under the Duke of York, was here

defeated with great loss by the French in 1794. Pop. 8000.

Box-thorn (*Lycium*), a genus of Solanaceæ, having funnel shaped or tubular flowers, and two-celled berries. Several species are natives of the south of Europe, thorny shrubs, with long slender shoots and simple lanceolate leaves. *L. europæum* may be trained to a height of 30 or 40 feet, and is often planted—as are also other species—to cover walls, &c. *L. vulgare* has been sparingly naturalised in the United States. *L. fuchsoides*, although destitute of spines, is used as a hedge-plant in the Andes of Quito.

Boyacá, a town of Colombia, in the Cordillera Oriental; pop. 7000. At Boyacá, Bolívar by a decisive victory over the Spanish army, 7th August 1819, secured the independence of New Granada.

Boyar, an order in old Russia, next to the knjazes or knjeses (ruling princes). They had their own partisans, and gave their services to a prince of their own choice, whom they left again at their pleasure. They held the highest military and civil offices, and were so universally looked up to by the mass of the people, that the most powerful rulers considered it prudent to use this form in their ukases: 'The emperor has ordered it; the Boyars have approved it.' Their rank was always proportioned to length of state-service. In their housekeeping the Boyars were excessively fond of splendour, and their contempt for the serfs or 'lower orders' was immeasurable. Their power acted as a wholesome check upon the authority of the princes, in consequence of which the latter became their bitter enemies. Peter the Great finally abolished the order by giving them a place among the Russian nobility, but at the same time stripping them of their peculiar privileges.—The higher nobility of Rumania are also called Boyars.

Boyaux (Fr., 'bowels') are the zigzag approaches used in siege operations to connect the parallels. See SIEGE.

Boy-bishop. The custom of electing a boy-bishop on St Nicholas's Day dates from a very early period. It spread over most Catholic countries, and in England seems to have prevailed in almost every parish. Although the election took place on St Nicholas's Day (6th December), the authority lasted to Holy Innocents' Day (28th December). The boy-bishop was chosen from the children of the church or cathedral choir, or from the pupils at the grammar-school. He was arrayed in episcopal vestments, and, attended by a crowd of subordinates in priestly dress, went about with songs and dances from house to house, blessing the people, who, as Bishop Hall says, 'stood grinning in the way to expect that ridiculous benediction.' The mock prelate exacted implicit obedience from his fellows, who, along with their superior, took possession of the church, and performed all the ceremonies and offices except mass. The custom found countenance not among the populace only. In 1299 Edward I., on his way to Scotland, permitted a boy-bishop to say vespers before him at Heaton, near Newcastle-on-Tyne. At Salisbury the boy-bishop, it is said, had the power of disposing of such prebends as happened to fall vacant during the days of his episcopacy; and if he died during his office, the funeral honours of a bishop, with a monument, were granted him. The genuineness of 'the boy-bishop's monument' in Salisbury Cathedral has, however, been seriously questioned. In England the custom was abolished by a proclamation of Henry VIII., dated July 22, 1542; restored by Queen Mary in 1554; and again abolished in Elizabeth's time, though it seems to have lingered here and there in villages till about

the close of her reign, and was revived in the 20th century. It was interdicted at the Council of Basel (1431); and at Zug a similar usage was suppressed in 1797. See Leach, *Schools of Medieval England* (1915); Chambers, *Medieval Stage* (i. 1915).

Boyce, WILLIAM, composer, born in London, 1710, was a chorister at St Paul's, and was appointed composer to the Chapel-royal in 1736, and organist in 1758. He received the degree of Doctor of Music from Cambridge in 1749, and was master of the king's band from 1755. He died at Kensington, 7th February 1779. Boyce holds a high rank as a composer of church music, his two services and several of his anthems being still frequently performed. His songs include 'Heart of Oak,' written for one of Garrick's pantomimes; and a miscellaneous collection of his songs and cantatas extended to 6 volumes. His best work is the serenata of *Solomon* (1743); his most valuable publication is a collection of the *Cathedral Music* of the two preceding centuries (3 vols. 1760).

Boycotting, the system of combining to hold no relations, social or commercial, with a neighbour, in order to punish him for differences in political opinion—a kind of social excommunication. It was first formulated by Mr Parnell, the Irish leader, at Ennis on 19th September 1880, and derived its name from one of the first victims, Captain Boycott, a Mayo factor and farmer, who has had for his sufferings the consolation of giving a new word to most European languages. The term 'exclusive dealing' has been applied by its apologists to boycotting, which was brought within the law by the Crimes Act of 1887.

Boyd, REV. ANDREW KENNEDY HUTCHISON, D.D., son of the parish minister of Auchinleck, Ayrshire, where he was born November 1825, was educated at King's College, London, and Glasgow University, where he took the highest honours in philosophy and theology. He was in succession minister in three Scottish parishes before his settlement at St Andrews. He first became known in literature by his familiar essays contributed to *Fraser's Magazine* under the now well-known initials A. K. H. B., most of which have been reprinted—some of these, in three series of them as *The Recreations of a Country Parson* (1859–61). Three volumes of reminiscences—*Twenty-five Years of St Andrews* (2 vols. 1892) and *St Andrews and Elsewhere* (1895)—were his last considerable work. He died 1st March 1899.

Boyd, ZACHARY, born in Ayrshire about 1585, and educated at Glasgow and St Andrews, became a professor in the college of Saumur (q.v.). The persecution of the Huguenots having caused him to return to Scotland in 1621, he was two years later appointed minister of the Barony parish, Glasgow, and was thrice elected rector of the university. His *Last Battell of the Soule in Death* (in prose, 1629) was reprinted in 1831; of the quaint *Zion's Flowers* (1644)—mostly metrical versions of Scripture history—a selection was reprinted in 1855. He died in 1653 or 1654.

Boydell, JOHN, was born at Dorrington, Shropshire, in 1719, and having learned engraving, about 1750 started a print-shop in London, and liberally patronised native engravers. For a splendid edition of Shakespeare (9 vols. folio, 1792–1801) he secured the assistance of painters like Opie, Reynolds, Northcote, and West, and from this 'Shakespeare Gallery' produced a superb volume of plates (1803). But his outlays involved him in serious financial embarrassment. He died 12th December 1804. In 1790 he had been Lord Mayor.

Boyer, ALEXIS, BARON DE (1757–1833), a great French surgeon, was born a tailor's son at Uzeiches in Limousin, and in 1805 was appointed first surgeon

to Napoleon, whom he accompanied on his campaigns. After the Restoration he was professor of Surgery at Paris, and surgeon at the Chaiité.

Boyer, JEAN PIERRE (1776-1850), a mulatto, born at Port-au-Prince, did much to secure the independence of Hayti (q.v.), and became president of the black republic in 1818. He governed the state admirably for fifteen years; but power corrupted him, and he became partial and arbitrary. His partiality to the mulattoes made the pure negroes rise in insurrection in 1843; and Boyer fled to Paris, where he died.

Boyle, a town in County Roscommon, Ireland, on the river Boyle, above its expansion into Lough Key, 108 miles NW. of Dublin; pop. 2700.

Boyle, CHARLES (1677-1731), fourth Earl of Orrery, in 1721 was imprisoned in the Tower as a Jacobite. In the great controversy on the *Letters of Phalaris*, he was Atterbury's stalking-horse against Bentley (q.v.); and the Orrery (q.v.) was named in his honour by its inventor, Graham.

Boyle, JOHN (1707-62), fifth Earl of Orrery (1731), and fifth Earl of Cork (1753), is remembered more by his rancorous *Remarks on Swift* (1751), his intimate friend, as was also Pope, than by an excellent translation of the *Letters of Pliny* (1751).

Boyle, RICHARD (1566-1643), the Great Earl of Cork, was born at Canterbury, of good family. After studying at Cambridge and the Middle Temple, he went over to Ireland with a few pounds in his pocket to hew his way to fortune (1588). He married an heiress, purchased large estates in Munster and improved them, promoted the immigration of English Protestants, and won the favour of Queen Elizabeth. He built bridges, founded harbours and towns, erected thirteen strong castles, and from his ironworks reaped £100,000. About 4000 persons found employment on his vast plantations. He was knighted in 1603; in 1620 became Viscount Dungarven and Earl of Cork; and in 1631 was made lord high-treasurer, an office which remained hereditary in his family. In his old age the Munster rebels compelled him to turn his castle into a fortress, but he soon raised a little army, and quenched rebellion in his borders. See his *Life and Letters* by Dorothea Townshend (1904).

Boyle, ROBERT (1627-91), physicist, fourteenth child of the first Earl of Cork, was born at Lismore Castle in Munster, and after studying at Eton, and under the rector of Stalbridge, Dorset, went to the Continent for six years. On his return in 1644, he found himself in possession, by his father's death, of the manor of Stalbridge, where he devoted himself to chemistry and natural philosophy. He was one of the first members of the association (1645) which became the Royal Society. Settling at Oxford in 1654, he experimented in pneumatics, and improved the air-pump. As a director of the East India Company (for which he had procured the charter) he worked for the propagation of Christianity in the East, circulated at his own expense translations of the Scriptures, and by bequest founded the 'Boyle Lectures' in defence of Christianity against atheists, deists, pagans, Jews, and Mohammedans, but not taking account of the controversies of Christians amongst themselves. In 1668 he took up residence in London with his sister, Lady Ranelagh, and gave much of his time to the Royal Society. In 1688 he almost wholly withdrew from society in order to repair the loss caused by the accidental destruction of his MSS. He believed in the possibility of some of the alchemistic transmutations; but in virtue of his many pregnant observations and the multitude of hoary errors he exploded has justly been termed the true precursor of the modern chemist. He discovered 'Mariotte's

law' seven years before Mariotte (q.v.). He invented a compressed-air pump, and the first English hermetically sealed thermometer was made under his directions. His complete works (with his correspondence and a Life by Dr Birch) were published in 5 vols. fol. (1744). See Life by Flora Masson (1914). Among the Boyle lecturers have been Bentley, Samuel Clarke, F. D. Maurice, Plumptre, Stanley Leathes, and Wace.

Boyle, ROGER (1621-79), soldier and statesman, was third son of the Earl of Cork, and in childhood was made Baron Broghill. Educated at Trinity College, Dublin, he in the Civil War first took the royalist side, but after the death of the king came under the personal influence of Cromwell, and distinguished himself in the Irish campaign. He became one of Cromwell's special council and a member of his House of Lords. On Cromwell's death he tried to support Richard, but, foreseeing that his cause was hopeless, crossed to Ireland and secured it for the king. Four months after the Restoration he was made Earl of Orrery. He wrote poems, six tragedies, two comedies, a romance entitled *Parthenissa* (1654), and a *Treatise of the Art of War* (1677); and enjoyed the friendship of Davenant, Dryden, and Cowley.

Boyle's Fuming Liquor is a mixture of ammonium poly-sulphides obtained by distilling a mixture of slaked lime, sal-ammoniac, and sulphur; a straw-coloured liquid with the odour of rotten eggs, and liberating sulphuretted hydrogen on addition of an acid or exposure to the air.

Boyle's Law. See MARIOTTE.

Boylesse, RENÉ (1867-1926), an able French novelist and Academician (1918), born at La Haye-Descartes (Indre-et-Loire), wrote *Le Parfum des Iles Borromées* (1898), *L'Enfant à la Balustrade* (1903), *Élise* (1921), and other books.

Boyne, a river in the east of Ireland, rises in the Bog of Allen, and flows 80 miles to the Irish Sea 4 miles below Drogheda. At the battle of the Boyne, fought on its banks, 3 miles W. of Drogheda, on 11th July 1690 (1st July, o.s.), but celebrated on the 12th, William III. with 40,000 men defeated James II. with an ill-equipped army of 26,000. William's Duke of Schomberg was shot dead. James fled from the field straight to France. The significance of the battle in deciding the fate of the Stewarts was celebrated in a doggerel 'Boyne Water,' the tune of which has continued, especially on the anniversary of the event, to inspire Orangemen and irritate militant Catholics. The version now sung begins, 'July the first, in Old-bridge town, There was a grievous battle,' but is not the oldest (see *Irish Minstrelsy* in 'The Canterbury Poets,' 1887).

Boyne City, a town of Michigan, at the SE. end of Pine Lake, 15 miles SSE. of Charlevoix, has lumbering and manufacturing industries; pop. 4000.

Boys' Brigades have all taken their rise from 'The Boys' Brigade, the pioneer organisation, which was founded in Glasgow in 1883 by Sir William A. Smith (1854-1914). The original company, now known as the 1st Glasgow Company, was formed in connection with the Mission Sunday School of the College Free Church, Glasgow, and consisted of 3 officers and 30 boys. Its membership was confined to boys between the ages of 12 and 17, and its object was defined as 'the advancement of Christ's kingdom among boys, and the promotion of habits of obedience, reverence, discipline, self-respect, and all that tends towards a true Christian manliness.' In its second year three other companies in Glasgow and one in Edinburgh were added to the brigade. In its third year it crossed

the border to London and Manchester, and took its first big stride, closing the year with 44 companies and 2000 boys. In its fourth year it crossed the Atlantic and took root in Canada and the United States. Since then there has been a continuous advance, so that the Boys' Brigade is established in almost every English-speaking country, and is composed of 2300 companies, each connected with a church or other Christian organisation, with a membership of 11,000 officers and staff-sergeants, and over 120,000 boys. The church connection secures the results of the brigade work within the church, and provides a responsible body upon whom the executive can depend to see that the company is carried on in accordance with the constitution.

Military organisation and drill are used as a means of securing the interest of the boys, banding them together in the work of the brigade, and promoting among them such habits as the brigade is designed to form. Other methods used are Bible-classes and Sunday services, physical training and gymnastics, ambulance classes for 'first aid to the injured,' reading and recreation rooms, swimming and life-saving instruction, and summer camps where the boys spend a week at seaside or country under the control and influence of their officers. Many thousands of boys receive a musical training in the instrumental bands of the brigade. The brigade aims at taking up everything that enters into healthy boy-life, and directing it all into channels that make for good citizenship. The governing body is the Brigade Council, composed of the captains of all the companies. The council elects annually an executive, consisting of president, vice-presidents, secretary, treasurer, and sixteen other members. In most large cities there are battalion councils, composed of local officers, for the administration of their own affairs, while the London council controls all the battalions and companies within London and the home counties.

What is here said of the Boys' Brigade is true, more or less, of all the other boys' organisations which have sprung from it, all of which are contributing their share to the moulding of the lives and characters of the rising generation. While the Boys' Brigade is inter-denominational, embracing companies connected with the Church of England, the Church of Scotland, the Church of Ireland, and all the leading branches of the Nonconformist Church, the other organisations are for the most part confined to individual churches or religious communities, such as the Church Lads' Brigade in the Church of England, the London Diocesan Church Lads' Brigade for the diocese of London, the Catholic Boys' Brigade for the Roman Catholic Church, and the Jewish Lads' Brigade for the Jewish community. Of these, the Church Lads' Brigade is the largest, with a membership of about 60,000. It is probably within the mark to say that all these boys' organisations taken together embrace not fewer than 200,000 boys, who are thus brought under healthy physical, moral, and religious training, as a direct result of the Boys' Brigade movement.

Boy Scouts were founded and organised in 1908 by General Sir Robert Baden-Powell 'to help the boys of whatever class to become "all-round" men, to give them "character," and to make them capable of looking after themselves in whatever circumstances they are placed.' Decentralisation is an important principle in their organisation. Patrols and troops are under the control of scout-masters (21 years of age) and assistant scout-masters (18 years), to whom, notwithstanding the existence of local committees, county associations, and other central machinery, a large degree of freedom is allowed as to the form that the activities

of the patrols shall take. They may specialise in ambulance, woodcraft, seamanship, or many other branches, though it is expected that they should not allow any one to exclude the rest. Scoutcraft is taken to include discipline, observation, woodcraft, health, chivalry, life-saving, and patriotism. Under woodcraft come camping, cooking, natural history, map-reading, finding one's way, boating, swimming, carpentry, cycling, and the like. In these, and in tracking animals, noticing details, interpreting small signs, judging heights and distances, and a vast variety of kindred matters, instruction is given by means of games, lectures, and competitions. On joining, a boy has to pass a test involving a knowledge of knot-tying, of the composition and use of the Union-jack, and of the scouts' laws. These laws inculcate honour, obedience to authority, courtesy, cheerfulness, avoidance of snobbery, helpfulness to others, kindness to animals, and devotion to duty. 'A scout,' says the law, 'smiles and whistles under all circumstances. When he gets an order he should obey it cheerily and readily, not in a slow, hang-dog sort of way. Scouts never groan at hardships, nor whine at each other, nor swear when put out.' A 'tenderfoot' becomes a 'second-class scout' on passing tests in first aid and bandaging, signalling, tracking half a mile in twenty-five minutes, or (if in town) describing the contents of one shop window out of four observed for one minute each, or remembering sixteen small articles out of twenty-four exposed for one minute, going a mile in twelve minutes at 'scout's pace,' laying and lighting a wood fire with not more than two matches, cooking meat and potatoes with no utensils but a billy, having at least sixpence in a savings bank, and knowing the points of the compass. Further tests of a more searching kind entitle to a first-class scout's badge. In addition there are many proficiency badges—as those of 'bee-farmer,' 'interpreter,' 'plumber,' 'musician.'

So immediate and complete was the success of the movement that after two years there were 150,000 scouts in the United Kingdom alone, and many in the colonies and on the Continent. As for its results, it was claimed that in the last six months of 1909 the average number of lives saved by Boy Scouts was five a week. In order that girls might participate in the movement, the 'Girl Guides' were founded. It has been objected that scouting tends towards militarism; but this, notwithstanding certain passages in Sir R. Baden-Powell's *Scouting for Boys*, perhaps to be explained by the author's profession and experiences, is repudiated by its leaders. Other movements, more or less similar, have been much less successful, probably because their sources were less sensitive to some of the tendencies of the time, and in particular because they were less complete expressions of the increasing boyishness of adults. Some were bound in by ecclesiastical limitations that had never counted for much in boys' eyes. Others aimed at transplanting grown-up and sometimes effete ideals to boys' minds. The Boy Scout movement is the product of a generation whose delight in physical fitness was only whetted by a disposition to see physical degeneracy in the nation; for whom active participation in sport and a delight in watching wild life were not merely matters of educational theory to be applied to the young, but a strong rejuvenating influence upon men and women; who valued bodily and mental health, activity, and freedom; who cared more for inner realities than traditional forms; and in consequence were able to meet boys on their own ground with an ideal they could understand.

Bozrah (modern *el-Busaireh*), a strong town of Edom, in the mountain district to the south-east

of the Dead Sea, about 300 B.C. capital of the Nabateans, but now an unimportant village.

Bozzaris, MARCOS, Greek patriot, was born about 1788 at Suli, in the mountains of Epirus. His youth was spent amid the din of arms. In 1803 he was forced to retreat to the Ionian Isles by Ali Pasha (q.v.), who had nearly exterminated the Suliotes. In 1820 Ypsilanti summoned the Greeks to insurrection, and war broke out between Ali Pasha and the sultan. On learning the news, Bozzaris put himself at the head of some 800 expatriated Suliotes, and passed over into Epirus. Ali found means to secure their services against the common enemy, and Bozzaris gained several victories, and on Ali's death continued the war successfully. Shortly after, Prince Mavrocordato landed at Missolonghi with a body of disciplined troops, and being joined by Bozzaris, he engaged the Turks at Petta, 16th July 1822, but was compelled to retire to Missolonghi, which place Bozzaris skilfully defended. In 1823 a Turco-Albanian army of 13,000 men descended from the north of Epirus. Bozzaris advanced swiftly at the head of 1200 men, and on 20th August reached Karpenisi, where the van of the Turkish army, 4000 strong, was encamped. At night, 350 Suliotes burst in upon their startled foes, who were routed with great slaughter; but Bozzaris fell while leading on his men to the final attack.

Bozzolo, a town of north Italy, 14 miles WSW. of Mantua; pop. 5000.

Bra, a town of north Italy, 31 miles SSE. of Turin by rail; pop. 15,000.

Brabançonne, the patriotic song of the Belgians, originally sung by the insurgents during the revolution of September 1830. The words were written by Jenneval, a young French actor, then at Brussels, the music by Campenhout.

Brabant was the name formerly given to an important province of the Low Countries, extending from the left bank of the Waal to the sources of the Dyle, and from the Maas and the plain of Limburg to the Lower Scheldt. In the time of Caesar, Brabant was inhabited by a mixed race of Germans and Celts; it afterwards came into possession of the Franks; and in the middle ages it formed a duchy by itself, dependent upon Lower Lorraine, with which in 1107 the county of Antwerp was incorporated, and in 1347, for a time, the lordship of Mechlin or Malines, formerly connected with Liège. After many changes, Brabant was made a part of the kingdom of Holland, at the Congress of Vienna; but since the revolution of 1830, the three provinces of Brabant have been divided as follows: (1) North or Dutch Brabant, containing 1980 sq. m. and (1920) 732,000 inhabitants; (2) the Belgian province of Antwerp, which contains 1094 sq. m. and 1,000,000 inhabitants; and (3) the Belgian province of Brabant (South Brabant), containing 1268 sq. m. and an extremely dense population of 1,600,000. The country consists of a plain gently sloping to the north-west, and rising in the south into low hills, which are offsets of those of the Ardennes. In the level northern part are many heathy and fenny tracts; one of them, a morass called the Peel, is over 20 miles in length, and from 2 to 6 broad. In the hilly district of the south is the Forest of Soignes. The Maas and the Scheldt are the principal rivers; but some of their tributaries are also very useful for internal commerce, which is further promoted by canals and railways. The soil is fertile, and grain, vegetables, and hay are extensively grown; also hops, tobacco, and chicory. Farm stock is large. The making of salt, beet-sugar, cigars, thread, woollen cloths, leather, earthenware, and soap, with printing, distilling, and turkey-red dyeing, are the chief industries.

Brabant lace has a certain celebrity. Most of the inhabitants are Catholics; those in the north are Dutch, in the middle Flemish; in the south Walloons. See a book by Omond (1907).

Brabazon, HERCULES BRABAZON (1821-92), an English county gentleman, was a water-colourist of singular power and delicacy, some of his work ranking with Turner's. See Life by Hind (1912).

Brač. See BRAZZA.

Braccio di Montone (1368-1424), called 'Fortebracci', a celebrated Italian free-lance, born in Perugia, of an old patrician family. From his early youth he was engaged in warfare, and had already given his sword to very various causes, when in 1416 he obtained the sovereignty of his native city. The year after he held Rome for a time. Next he accepted from Queen Joanna of Naples the command of her land-forces, and soon for his services was created Count of Foggia and Prince of Capua. In 1423, by the queen's command, he was crowned at Perugia, as Prince of Aquila and Capua. His ambition now soared to the throne of Naples itself. He overran Campania and Apulia, and advanced into Calabria, but in a battle before Aquila was wounded and taken. Three days later he died.

Bracciolini. See POGGIO BRACCIOLINI.

Brace, in Carpentry, an oblique piece of wood used to bind together the principal timbers of a roof or other wooden structure. The name is also used of the curved iron tool (holding a *bit*) used by carpenters for boring. See ROOF, BORING.

Brace, CHARLES LORING (1826-1900), born at Litchfield, Connecticut, studied theology in New York, and in 1853 founded the Children's Aid Society, which ere the end of the century had provided homes for 100,000 children. He published notes of visits to Hungary, Germany, Norway, and California (1869), besides *The Races of the Old World* (1863), *Gesta Christi* (1882), and other works.

Bracegirdle, ANNE (1663-1748), an accomplished and much-esteemed actress, who played with unparalleled success both in tragedy and in comedy on the London stage till eclipsed by Mrs Oldfield in 1707. Her character stood unusually high for virtue and benevolence.

Bracelet, a personal ornament worn, like the armlet (Lat. *armilla*), by almost every nation. Among the English and other Germanic tribes of the heroic age gold bracelets served as money (see RING-MONEY), and a generous chief was commended as a ring-giver. In the authorised version of the Old Testament three different words were rendered by 'bracelet.' One of these probably means an armlet worn by men (Num. xxxi. 50, 2 Sam. i. 10); the second was a bracelet worn by women, and sometimes by men (Gen. xxiv. 22, Ezek. xvi. 11); the third a peculiar bracelet of chain-work worn only by women (Isa. iiii. 19). That referred to in 2 Sam. i. 10 was an ornament that belonged to the king, like those famous armlets with their splendid diamonds which now form part of the regalia of the kings of Persia, and which are said once to have belonged to the Mogul emperors of India. The ancient Medes and Persians were remarkable, even amongst Asiatics, for their love of ornaments of this kind; and they were worn in Europe by the Gauls and Sabines. They do not seem to have been worn by men among the ancient Greeks, but Greek ladies wore both armlets and bracelets of the most various materials and forms. Some of these went round the arm twice or thrice, and a favourite form was that of a serpent. Many examples of this kind occur on painted vases. Amongst the Romans, armlets were not usually worn by men, but were frequently conferred upon soldiers for deeds of

valour (Livy, x. 44). Roman ladies wore bracelets, not only for ornament, but also for the purpose of containing amulets, as it is said that Nero wore on his right arm the skin of a serpent, inclosed in a golden armilla. Some early armlets were evidently worn more for defence than ornament.

Brachet, AUGUSTE (1844-98), born at Lille, studied philology under Diez and Littré, and taught languages at Paris. He wrote on things Italian, but is best known for his *Grammaire Historique* and *Dictionnaire Étymologique* of the French language.

Brachial Artery is the great arterial trunk supplying the upper extremity between the armpit and the elbow; in other words, it is the direct continuation of the axillary artery. It runs down the front and inner side of the upper arm, giving off several named branches as it proceeds, and at a point about an inch below the bend of the elbow it terminates by dividing into radial and ulnar arteries. In cases of arterial bleeding from wounds of the hand or forearm, the brachial artery may be compressed against the middle of the shaft of the humerus, just behind the inner margin of the biceps muscle. See ARM, ARTERY, CIRCULATION.

Brachiopoda, a class of shelled animals having certain affinities with worms and with Polyzoa, but less with molluscs, though often included within the limits of the last-named group. The presence of two shells gives them a superficial resemblance to true bivalves (Lamellibranchs), but the shells lie dorsally and ventrally instead of right and left, and the anatomy of the inclosed organism is quite different.

History.—Naturalists were for long content with placing Brachiopods beside *Anomia* or among Lamellibranchs. Forbes and others have shown that this is impossible, and the growing tendency, due to better acquaintance with their structure and to the researches of Morse, Kovalevsky, and others on their embryology, has been to regard them as specialised and passive Annelid types. Other suggestions have not been wanting, but there is now a general consensus of opinion in defining them as one of the many offshoots from the 'worm' branch of the genealogical tree. The Tunicata have been removed from any close alliance with Brachiopods, while the Polyzoa have come to be regarded as very closely allied.

Structure.—The external form of the animal certainly suggests that of an ordinary bivalve, but, as above noted, the position of the two valves is quite different. The size varies from considerably

Fig. 1.—*Rhynchonella psittacea* seen from the dorsal aspect (a) and from the side (b).

under half an inch to an inch, or rarely two inches in length. The shell consists of two distinct valves, the ventral usually larger than the dorsal, and each divisible into symmetrical halves. Where the valves unite, a perforated beak is often present. Through the hole of the beak a muscular bundle passes, serving in some cases for mooring the animal. The shell may be horny (among Discinidæ and Lin-

gulidæ), glassy, or massively limy. Its structure is very much simpler than that of ordinary bivalves, and often consists of a single layer, which, in the majority, is penetrated by skin processes, which possibly have a respiratory significance. These are absent in Rhynchonellidæ and a few others, where the shell is therefore described as non-porous. The outer surface may be sculptured and coloured. The dorsal valve bears internally a limy ribbon of very varied shape, which forms the supporting organ of the respiratory apparatus. The ventral valve is in many cases provided with hinge teeth, which fit into depressions in the upper valve and lock the two halves firmly together.

The shell is secreted and lined by a delicate double membrane or *mantle*. Between the two layers there is a rich distribution of blood-vessels (the arterial system according to Huxley) which are connected with the body proper by two or four contractile heart-like organs. They communicate with the mantle-cavity, and with a chamber which occupies most of the body-cavity proper. The outer layer of the mantle next the shell often sends blind processes into canals which traverse the valves. The mantle is often strengthened by microscopic limy plates, and the margin very generally bears stiff bristles. The internal surface of the inner layer is ciliated. The body proper lies towards

Fig. 2.—Interior of the smaller (dorsal) valve of a Brachiopod shell (*Waldheimia*), showing the limy framework which supports the arms.

the hinge, and the large space between the two mantles is occupied by two large and exceedingly characteristic organs, which are probably respiratory, and certainly serve to waft little food-particles to the mouth. They consist of long tubes, bearing on one side movable cirri, and varying greatly in their degree of freedom and manner of twisting. In some cases these can be protruded through the open valves, in other cases they return upon themselves and are supported throughout by the limy ribbon above mentioned. They are tentacular, or labial organs, and arise from the outpulled margins of the mouth; in a few cases they are absent. The three or more pairs of muscles working the valves of Brachiopods are more complex than those of Lamellibranchs, and vary considerably in the two main divisions. The nervous system consists of a ring round the gullet, with superior and larger inferior pairs of ganglia, and of nerves regularly distributed to the various organs. Sense organs seem to degenerate in the very passive adults, but the young may possess eyespots, and sometimes also ear-sacs. The alimentary system consists of the inconspicuous mouth at the base of the long tentacles, of an ascending gullet widening into the stomach, of an associated digestive gland, and of an intestine which bends downwards, and either ends blindly or in an anus on the right side anteriorly. The respiratory system, as already noticed, probably consists of the processes from the mantle and of the tentacular arms, but further researches are necessary to make this certain. The vascular system between the mantle-layers has been already noted. The heart is usually described as a pear-shaped organ above the stomach, supplied by a main vein, and giving off

two arteries. The excretory system consists of a pair of tubes (compare segmental organs of other Invertebrates) to the right and left of the gut, opening internally into the body-cavity, and externally into the space between the two mantle-flaps. In *Rhynchonella psittacea* a second pair is present. These tubes serve also for genital ducts. The reproductive system is usually represented in one division by two pairs of glands, situated in sacs from the body-cavity into the mantle-cavity, and in the other division by glands near the coils of the gut. In the former the sexes are separate, in the latter the glands are hermaphrodite.

Mode of Life.—The adult Brachiopods are excessively passive organisms. Some are fixed by whole or part of their ventral valves, others seem to have been anchored in the mud by long spines, while a few are stalked either for life or in their earlier stages. The lamp-shell *Lingula*, with the longest stalk, is at the same time, as one would expect, one of the least limy, and has in fact a horny shell. *L. pyramidata* has been shown by Morse to have the power of moving along the sand, and *Terebratulina caput serpentis* has also considerable power of moving on its stalk. The nadir of passivity as expressed in enormously thick limy shells is well illustrated by the very large and massive fossil Productidae. The food seems largely to consist of diatoms, but the Lingulidae are also known to sweep in small crustaceans and abundance of mud. They are all marine, and attach themselves to rocks, corals, molluscs, &c.

Development.—The eggs may be laid externally, or develop within the ducts, or in *Thecidium* in a special brood-chamber. The segmented larvæ, which in some cases show marked affinities with Chaetopod worms, are free-swimming and very unlike the adults. They fix themselves by their posterior portion, lose their anterior sensory region, and form the body out of the rest.

Distribution in Space.—The Brachiopods are widely distributed, but are at the same time much localised. In favourite haunts they occur in great numbers. *Lingula* abounds at above half-tide mark, while the more abundant limy forms go down to very great depths—as far as 2600 fathoms. The horny forms are fonder of warm and tropical, the limy of cold and temperate waters.

Distribution in Time.—The Brachiopods furnish a striking illustration of a moribund class. In former periods they were vastly more numerous. The hingeless forms appear first, soon accompanied by hinged types, in the Cambrian strata; in Silurian times they were exceedingly numerous; in the Devonian was their golden age. In the Carboniferous strata they are much rarer, and still more so in the Dyas. They increase again in the Jurassic, and reach another climax, sinking again in the Chalk, and gradually dwindling to the presently existing residue. Of the 125 genera and 2600 species, 17 genera and 110 species are still extant—a striking instance of decadence, which may in part be due to their extreme passivity, and also to the number of relatively trivial characters so often connected with this state. *Lingula* and some others have persisted from the earliest times.

Classification.—The Brachiopods are often divided into two orders of Testicardines and Ecardines, respectively with and without hinges. In the former it may be further noted that the shell is always limy, the mantle-flaps are united posteriorly, the gut ends blindly. In the latter the shell may be horny, there is no arm skeleton, the mantle-flaps are always separate, the gut has an anal aperture. *Terebratula*, *Thecidium*, *Stringocephalus*, *Rhynchonella*, *Spirifer*, *Strophomena*, and *Productus* are examples of the various families of the

former; *Crania*, *Discina*, *Obolus*, and *Lingula* of the latter. The absence or presence of an anus, in regard to which there is a good deal of reasoning from analogy in default of observation, is expressed in another couple of names—Clistenterata for the former sub-class, Tretenterata for the second. The terms Articulata and Inarticulata refer to the same twofold division, and emphasise the presence or absence of the locking hinge. The two terms Testicardines and Ecardines are, however, generally adopted. It has been proposed to erect a third division—Abrachia—for a few armless forms, in which these characteristic organs are replaced by a tentacular sheath formed from the mantle. In other respects they resemble Testicardines.

See Davidson, *Fossil Brachiopoda* (1859), *Challenger Reports*, Huxley's *Invertebrates*, and Schuchert in Von Zittel's *Palaeontology* (trans. 1900-2).

Brachistochrone (Gr. *brachistos*, shortest; *chronos*, time), the curve along which a body travels from one fixed point to another in shortest time.

Brachvogel, EMIL (1824-78), German playwright and novelist, born in Breslau.

Brachycephaly. See SKULL.

Brachyura, a technical name applied to the short-tailed decapod crustaceans or crabs, in contrast to the long-tailed forms like the lobsters, where the abdomen is not tucked in on the under surface in the characteristic crab fashion. The term is also applied to a family of bats, including *Mystacina* and *Noctilio*, in which the tail is very short.

Bracken, or **BRAKE**, a large genus of Ferns of the division Polypodæ, distinguished by spore-cases in marginal lines covered by the reflexed margin of the frond. It is very widely distributed from arctic and temperate to tropical countries. The Common Brake or Bracken (*Pteris aquilina*) is the largest, commonest, and handsomest of European ferns, often covering considerable tracts in woods and parks, or on heaths and hills. It has a long, creeping, black rhizome, or root-stock, behind the apex of which a new frond arises annually. The fronds are bipinnate, but the first two pinnae are as large as the remainder of the frond, which is moreover bent into the same horizontal plane, so producing a three-branched appearance, which is very characteristic. The fibro-vascular bundles of the stalk of the frond, when cut across, exhibit an appearance slightly resembling a spread eagle, whence the specific name *aquilina* (Lat. *aquila*, 'an eagle'); while the two dark strands of sclerenchyma in the root-stock suggest the letters J C, whence the medieval name of Christ-root, and a character of sanctity confirmed by the crozier-like unrolling of the fronds in spring. The root-stock is bitter, and has been used as a substitute for hops; it has also been ground, mixed with barley,

Common Brake :

a, end of a branch, much reduced; b, end of a pinnule, lower side, showing fructification.

and made into a wretched bread in times of distress. It was of importance as a food-supply in Teneriffe, furnishing the so-called Helecho-bread. The plant is astringent and anthelmintic; and as such, it had at one time a high reputation in medicine, and was also employed in dressing kid and chamois leather. The ashes were formerly used in the manufacture of soap and glass. Bracken is also employed for thatching, for littering cattle, for manure, &c., and has been chopped up with straw or hay for feeding cattle. It is a favourite covert of deer and of other game. The abundance of this plant is sometimes regarded as a sign of poor land, although, probably, its absence from the richer soils is very much a result of cultivation. To extirpate it, nothing more is necessary than a few successive mowings of the young shoots as they appear. The annual growth of brake is killed by the first frosts of autumn, but remains rigid and brown, still affording shelter to game, and almost as characteristic a feature in the landscape of winter as in that of summer.—*Pteris caudata*, a large species of brake very similar to that of Europe, is one of the worst pests which the farmer has to contend with in the south of Brazil.—*Pteris esculenta*, a native of New Zealand, Tasmania, &c., has a more nutritious rhizome than the common brake (see TARA FERN).—*Pteris serrulata* of India, China, and Japan is largely used as a table decoration on account of its grace and hardness.

Bracket, an ornamental projection from a wall, used for the purpose of supporting a statue, bust, or the like (see CORBEL). Brackets are either of stone, wood, or metal, and they are sometimes

Ornamental Brackets.

elaborately designed and carved. The term bracket is also employed in joinery, &c., to designate supports, in the form of a bent knee, of shelves, galleries, &c. Bracket is also generally applied to such gaslights as project from the wall.

Bracklesham Beds, a group of highly fossiliferous strata in the Eocene system of England.

Bract is a term applied to any leaf from the axil of which a flower or a floral axis is produced, instead of an ordinary leaf-bud or branch. In some cases the bracts present no marked differences from other leaves (e.g. *Belladonna*), and such flowers are then often termed axillary, meaning in the axils of unmodified leaves. In the great majority of cases, however, the familiar antithesis between vegetation and reproduction is strongly marked, the size and vegetative development of the leaf being greatly checked; thus the bract is usually small and entire, even though the vegetative leaves may be large and divided. They often exhibit an interesting gradation between leaves and petals, for the coloration of the flowers, which is so often evident for some distance down the flowering axis, may extend more or less completely to the bract; and this may

go so far as to completely replace floral magnificence altogether, as in the *Poinsettia* and *Bougainvillea* (q.v.) of our greenhouses. The subordination of vegetative life may go so far as to suppress the parenchyma altogether at a very early age, leaving only a dead membranaceous structure, brown and wizened in the bract or spathe of the daffodil, or glossy and bright coloured in the immortelle and other so-called everlasting flowers. Finally, in *Cruciferae* the bracts have disappeared in the great majority of species; yet in exceptional cases (particularly in double or otherwise highly vegetative specimens), their entire or partial reappearance shows that the apparent anomaly of their absence in this family is only the extreme case of a physiological contrast which is perfectly normal. It will be noticed that the term is applied (1) to bracts proper, each subtending a single flower; (2) as in *Compositae*, to the crowded leaves of the axis below the similarly crowded inflorescence (in which, however, true bracts subtending the florets also often occur—e.g. *Zinnia*, &c., also in *Dipsacaceae*); (3) to the leaf subtending an entire inflorescence, which may be either free-growing, with minor bractlets (palm), or compressed, as in the spadix of *Araceae*. Such a bract is termed a *spathe*.

Bracton, HENRY DE, English ecclesiastic and jurist, of whom but little certain is known save that he was a 'justice itinerant,' in 1264 became archdeacon of Barnstaple and chancellor of Exeter Cathedral, and died in 1268. He is memorable as one of the earliest writers on English law, his *De Legibus et Consuetudinibus Angliæ* being indeed the first attempt at a systematic treatment of the body of English law. Coke and Selden valued the work highly, and Milton quotes from it in his *Defence of the People of England*. The first printed edition of the entire work appeared in folio in 1569. A new edition in 6 volumes (introduction, text, translations, commentary, &c.) was begun by G. E. Woodbine in 1915. In 1887 F. W. Maitland published a *Collection of Cases* (3 vols.), accompanied by a series of strong and almost conclusive arguments that this was the actual collection of cases on which Bracton's great treatise was founded.

Braddock, EDWARD, a British general, born in Perthshire, Scotland, about 1695, entered the Coldstream Guards in 1710, and was appointed major-general in 1754. Nine months later he sailed as commander against the French in America, and with a force of nearly 2000 British and provincial troops, reached the Monongahela, a branch of the Ohio, on July 8, 1755. Leaving the baggage behind, on the 9th he pushed forward with a chosen force to invest Fort Duquesne, on the present site of Pittsburg, Pennsylvania. In spite of his obstinacy, he appears to have so far regarded the warnings of his American officers that he threw out flank and advance parties to guard against a surprise. He twice forded the Monongahela in order to avoid a dangerous defile; and it was on the right bank of the river that his advance guard was attacked by a party of about 900 French and Indians from the fort. Properly speaking, Braddock fell into no ambushade; but the dense cover of the forest, of which the Indians immediately took advantage to surround his force, and his dogged insistence on his men fighting in line, instead of imitating the tactics of the foe, exposed the British as a helpless living target to a withering fire, to which they could make none but a desultory and uncertain return. After two hours' fighting, in which Braddock, whose bravery was never called in question, had four horses shot under him, and was mortally wounded while vainly trying to rally his men, the survivors made a hasty retreat under Washington, Braddock's aide-*de-*

carnage, the only one of his staff who escaped unhurt. No less than 63 out of 86 officers, and 914 out of 1373 men engaged, were either killed or wounded. The French loss was trifling. Braddock died July 13, 1755. See Sargent's monograph (Philadelphia, 1855), and Parkman's *Montcalm and Wolfe* (1884).—The manufacturing town of Braddock, 10 miles E. of Pittsburg (pop. 20,000), covers part of the battlefield.

Braddon, MARY ELIZABETH (Mrs John Maxwell; 1837–1915), novelist, was born in Soho Square, London, the daughter of a solicitor. She very early showed a turn for literature, which she indulged in the usual manner, by sending verses and other trifles to the magazines and newspapers. Neither a comedietta brought out at the Strand in 1860, a volume of verse, nor one or two novels had had much success, when, in 1862, *Lady Audley's Secret*, the story of a golden-haired murderess, attained an enormous popularity, in three months reaching its eighth three-volume edition. *Aurora Floyd* (1863) was little less popular. Of all her seventy-five novels, one of the best is *Ishmael* (1884), a tale of the Second Empire, which depends not so much on sensation as character. Several of them appeared in *Temple Bar*, *St James's Magazine*, and *Belgravia*, a magazine of which she was for some years editor. Mainly her works depend for their interest on incident, and the art of their appeal to 'that low vice, curiosity,' in the conduct of a story carefully leading up to some suspended and unforeseen dénouement. In their particular way, they display undoubted talent: in style, they are fresh and vigorous, and their narrative power strongly excites the reader's interest.

Bradfield, in Berkshire, $7\frac{1}{2}$ miles W. of Reading, is the seat of a public school, St Andrew's College (1850).

Bradford, a great manufacturing city in the West Riding of Yorkshire, on a tributary of the Aire, 9 miles W. of Leeds, 34 SW. of York, and 191 NNW. of London by rail, derives its name from a ford over the river. The area of the ancient parish is 34,146 acres, and includes 13 townships. In 1899 the township of Idle was included in it. Bradford in 1832 was created a parliamentary borough, returning two members. It became a municipal borough in 1847, was constituted a county borough in 1888, and was created a city in 1897. The city has a lord mayor. The municipal borough was extended in 1873, in 1882, and in 1899, and the parliamentary borough made conterminous with it in 1885. For parliamentary purposes it is now divided into 4 districts, each returning one member. The corporation has been noted for its activity and spirit of improvement shown in beneficial local acts; in the execution of main drainage-works, the remodelling of portions of the town, its splendid water-works, its gas-works, and its very complete electric system. Bradford is the chief seat in England of the spinning and weaving of worsted yarn, and the great mart for the long wools used in worsted fabrics. It has developed worsted coating, velvet, and plush industries. The first mill was built in 1798; there are now hundreds of mills, employing a large population. There are great merchants' warehouses for worsted goods; also a 'conditioning-house' (1887 and 1900) for the weight, measure, &c. of such goods. Manningham Mills, for silk and velvet, erected at a cost of £500,000, are among the most extensive in the kingdom. For the alpaca and mohair industry in the neighbourhood, see also **SALT** (**SIR TITUS**), **SALTAIRE**. Coal and iron mines occur near Bradford, and the ironworks at Bowling and Lowmoor are very large and important; the making of machinery is a considerable industry; and stone is exported from quarries in the neighbourhood. There are over 50 churches belong-

ing to the establishment in the borough, and more than 160 Dissenting churches. The parish church of St Peter became a cathedral when the diocese of Bradford was carved out of Ripon and Wakefield in 1918. It is a fine building in the Perpendicular style, with a tower of later date, and contains a number of interesting monuments. Bradford has a town-hall (1873; since doubled in size) of mediæval design, with campanile and chimneys; mechanics' institute (1870); St George's Hall (1853); exchange (1867); extensive wholesale and retail markets; good grammar-schools; technical colleges; art-gallery; free library (1872); post-office, a fine building in the Italian style (1887); and two court-houses. It has many public parks: Peel Park (with an area of 56 acres), Lister or Manningham Park (56 acres), Horton Park (39 acres), Bowling Park (53 acres), Bradford Moor Park (15 acres), Wibsey Park, Harold Park, Heaton Woods, and Oakenshaw, besides 770 acres of moorland. There are many excellent charities. The early history of Bradford is connected with the De Lacies, in whose hands the manor remained until the beginning of the 14th century, when it passed by marriage to the Lancaster family. After the death of John of Gaunt, in 1399, it was held by the crown till the reign of Charles I., who sold it to the corporation of London. After being held by the Marsdens and the Rawsons, the manorial rights were leased by the corporation. In the civil wars the people of Bradford took the parliament side, and twice defeated the royalists, but were afterwards themselves defeated by the Earl of Newcastle. The worsted trade, introduced into Bradford at the end of the 17th century, has made rapid progress since the era of the steam-engine. In a riot at Bradford against the introduction of worsted power-loom in 1826, two of the rioters were shot dead by the defenders of the mill which contained the obnoxious machinery, and many more were wounded. In 1825 a strike for increased wages, in which 20,000 persons were concerned, lasted six months. The Baptists had a college here, which has been removed to Rawdon, 6 miles distant, and the Congregationalists have the United Independent College. The town is the seat of the first English temperance society. The merchants of Bradford are distinguished by their liberality and enterprise, the names of the Listers and the Salts being conspicuous. Statues of Sir Robert Peel, Richard Oastler, Sir Titus Salt, S. C. Lister (Lord Masham), W. E. Forster (1890) have been erected. The population of the municipal borough in 1881 was 183,032; of the extended county borough (1901) 279,809; (1921) 285,979. See James's *History of Bradford* (2 vols. 1841–66); Margaret C. D. Law, *The Story of Bradford* (1913); and the *Victoria History of Yorkshire*.

Bradford, a city of M'Kean county, Pennsylvania, 65 miles S. of Buffalo, in an oil district, producing refined oils, engines, boilers, machinery, motor-cycles, &c.; pop. 15,500.

Bradford Clay, a subdivision of the Great Oolite (Lower Oolite), is a blue unctuous clay, occurring at Bradford, near Bath, and extending for a few miles around; it is about 10 feet thick at Bradford, but may be thicker at Farleigh. It is remarkable for the occurrence in it of large numbers of a Crinoid (q.v.), *Apiocrinoides Parkinsoni*. The upper surface of the calcareous rock on which the clay rests is completely encrusted over with a continuous pavement formed of the stony bases of this crinoid. It had once formed the bottom of a sea, in which these animals lived, their stems bending with every motion of the water, and their star-like crown of arms outstretched in search of food. At

length, however, the clear water was invaded by a current largely charged with mud, which threw them down, and broke most of their stems off near the base. The stem, body, and arms have been dismembered, and are confusedly scattered through the clay. Although Bradford Clay is considered a local deposit, yet deposits containing the same fossils occur in Dorsetshire.

Bradford-on-Avon ('broad ford'), a town of Wiltshire, on the steep bank of the Avon, 9 miles SE. of Bath. It is an ancient town, and still shows some gable-fronted houses, built and roofed with stone. Formerly it was the seat of important woollen manufactures, and keiseymeres were first made here. The church of St Lawrence, probably 10th century, but perhaps built by St Aldhelm (q.v.) between 675 and 709, is the only perfect building of pre-Norman times now remaining in England. Only 38 feet long, it consists of a nave, chancel, and north porch, the most striking feature of the interior being the narrowness of the chancel-arch, which is not more than 3 feet across. It had been used for two centuries as a school and dwelling-house, when in 1856 it was discovered to be a church; and it has since been put in a state of thorough repair. Hard by, on the site of Aldhelm's monastery, is the parish church of the Holy Trinity (12th to 16th century; restored 1865-66). On the summit of Torr Hill are the ruins of a 14th-century chapel of the Virgin; and the town bridge retains its chapel. There is a large tithe-barn near by. In the neighbourhood is the pleasant valley of Avon, with many picturesque spots. At Bradford ('æt Bradan forða be Afne,' says the *Chronicle*), Cenwalh, king of the West Saxons, gained a great victory over the Welsh in 652. Pop. 4600. See books by W. H. Jones, Baldwin Brown, *Arts in Early England* (1903), A. G. Bradley's *Round about Wiltshire* (1907), and the *Victoria History of Wiltshire*.

Brading, a small but ancient town, once a parliamentary borough, in the Isle of Wight, 4 miles S. of Ryde by rail. The place can still show its stocks and bull-ring; and in 1880 the remains of a Roman villa, with a tessellated floor, were unearthed near the town. In the ruins, assumed to be those of the villa of the Roman governor, were found numerous coins and tiles; there are also traces of a whole row of buildings.

Bradlaugh, CHARLES, a prominent social reformer, but vigorous anti-socialist, was born in London in 1833. He had early to shift for himself, and was in turn errand-boy, small coal-merchant, and trooper at Dublin. Procuring his discharge, he returned to London in 1853, became clerk to a solicitor, and ere long a busy secularist lecturer, and pamphleteer under the name of 'Iconoclast.' His voice was heard in all popular causes, alike on platforms throughout the country and in the pages of his organ, *The National Reformer*; but in 1880 his name assumed a new importance on his being elected M.P. for Northampton. He claimed to make affirmation of allegiance in lieu of taking the parliamentary oath; but after the report of two select committees, the House refused to allow him either to make oath or to affirm. He continued his struggle with the House, was thrice re-elected by Northampton, and at length, in 1886, having taken the oath, he was allowed to take his seat. In parliament he gained respect by his strong sense and debating power, and he earned wide popularity by his agitation against perpetual pensions. Of his writings the best known is the *Impeachment of the House of Brunswick*. His republication, in conjunction with Mrs Annie Besant, of an old pamphlet, *The Fruits*

of Philosophy—a proposed solution for the over-population question—led in 1876 to a sentence of six months' imprisonment and a £200 fine, but the conviction was quashed on appeal. He died 30th January 1891.

See OATH, and his Life by his daughter, Mrs Bonner, and J. M. Robertson (1894).

Bradley, ANDREW CECIL, born in 1851, was in 1901-6 professor of poetry at Oxford. He published *Poetry for Poetry's Sake* (1901), *Shakespearean Tragedy* (1904), and *Oxford Lectures on Poetry* (1909).

Bradley, EDWARD ('Cuthbert Bede'; 1827-89), born at Kiddersminster, and educated at Durham University, was successively rector of Denton, of Stretton, and of Lenton, near Grantham. His facetious description of Oxford life in *Adventures of Verdant Green* (1853-57) had several successors.

Bradley, FRANCIS HERBERT, O.M. (1846-1924), philosopher, half-brother of Dean Bradley, was educated at Marlborough and Meiton College, Oxford. He wrote *The Presuppositions of Critical History* (1874), *Ethical Studies* (1876), *Principles of Logic* (1883; revised 1922), *Appearance and Reality* (1893), *Essays on Truth and Reality* (1914).

Bradley, GEORGE GRANVILLE (1821-1903), teacher and dean, was educated at Rugby and University College, Oxford, of which he became a fellow in 1844. He was assistant-master at Rugby (1846-58), headmaster of Marlborough until 1870, when he became head of University College. From 1881 to 1902 he was Dean of Westminster, successor to his friend Stanley, to whose *Life* he contributed. He wrote also *Aids to Latin Prose Composition*, and *Lectures on Job and Ecclesiastes*.—His daughter, MARGARET LOUISA WOODS, born in 1856, has shown dramatic power and tragic force in verse (*Collected Poems*, 1914) and novels.

Bradley, HENRY, philologist (1845-1923), was born in Manchester, and educated at Chesterfield Grammar School. After engaging in teaching and in commercial work at Sheffield, he removed to London in 1844, and wrote for literary journals. He was several times president of the Philological Society, edited English texts and philological works, and from 1889 was joint-editor of *The Oxford English Dictionary*.

Bradley, JAMES (1693-1762), was born at Sherborne, Gloucestershire, and studied at Balliol College, Oxford. His genius for mathematics and astronomy won him the friendship of Halley and Sir Isaac Newton, and secured his election to the Royal Society (1718). In 1721 he was elected Savilian professor of Astronomy at Oxford. In 1729 he published his theory of the aberration of the fixed stars, containing the important discovery of the aberration of light. His next discovery (1748) was that the inclination of the earth's axis to the ecliptic is not constant, a fact including the explanation of the precession of the equinoxes and the nutation of the earth's axis. In 1742 he succeeded Halley at Greenwich. He has been called the founder of observational astronomy, his observations numbering about 60,000.

See the memoir in Rigaud's edition of the works and letters, and Turner's *Astronomical Discovery* (1905).

Bradley, KATHERINE HARRIS. See FIELD (MICHAEL).

Bradshaw, GEORGE (1801-53), originally a map-engraver in Manchester, on 19th October 1839 commenced the issue of an occasional work, called *Bradshaw's Railway Time-tables* (from 1840 *Railway Companion*), which was corrected by a monthly time-sheet. By great efforts the railway companies were induced to consent to adjust their tables, once for all, for the beginning of each month; and the first

number of the monthly *Railway Guide* was brought out in December 1841, though the *Companion* survived till 1845. The second number of the *Guide*, published '1st month (January) 1842,' runs to 32 pages, and contains 42 or 43 lines of railway, in England only, without any advertisements. In 1847 the first number of *Bradshaw's Continental Railway Guide* was issued, which, in addition to the tables, gives topographical information. Bradshaw, who was an active philanthropist and a member of the Society of Friends, died of cholera near Christiania.

Bradshaw, HENRY (1831-86), bibliographer, antiquary, and scholar, was born in London, and educated at Eton and King's College, Cambridge. He assisted in Cambridge University Library, 1856-58, 1859-67, and in 1867 became librarian. His bibliographical faculty amounted to genius, and led to many brilliant discoveries, including *The Book of Deer*, and two unrecorded works ascribed by him to John Barbour. He was an authority on Chaucer, on ancient Celtic, and on many departments of bibliography. His *Collected Papers* appeared in 1889. The Henry Bradshaw Society edits liturgical texts. See *Life* by Prothero (1889).

Bradshaw, JOHN, regicide, was born near Stockport in 1602, called to the bar at Gray's Inn, and in 1649 appointed president of the high court of justice for the trial of Charles I. On that solemn occasion his manners were as short as his speeches were lengthy. For reward he was made permanent president of the Council of State, and Chancellor of the Duchy of Lancaster, with a grant of estates worth £2000 per annum. His 'stiff republicanism' embroiled him with Cromwell, who twice attempted to deprive him of his office of chief justice of Chester; but there is no direct proof that he ever engaged in the Fifth Monarchy and other plots. After Oliver's death he was appointed a commissioner of the Great Seal; and his last public act was to protest against the violent seizure of Speaker Lenthall by the army. He died 22d November 1659; and his body was buried with pomp in Westminster Abbey, but after his posthumous attainder, it was disinterred and hung on a gibbet, with those of Cromwell and Ireton.

Bradstreet, ANNE. See UNITED STATES (*Literature*).

Bradwardine, THOMAS, was born in England not later than 1290. His birthplace is uncertain; in his chief work he mentions that his father lived at Chichester. He studied theology, philosophy, and mathematics with distinguished success at Merton College, Oxford, and in 1325 was one of the proctors of the university. His fame as a theologian was founded on lectures he delivered at Oxford, and now rests on his *De Causa Dei contra Pelagium, et de virtute causarum, libri tres* (edited by Henry Savile, Lond. 1618), an able defence of the Augustinian doctrines of grace, fully proving his right to the scholastic title of 'Doctor profundus.' Called to the court of Edward III. by Stratford, Archbishop of Canterbury, he became confessor to the king, canon of Lincoln, and chancellor of St Paul's Cathedral. From 1338 he accompanied Edward III. on his campaigns in France. On the death of Stratford in 1348, Bradwardine was elected his successor by the chapter of Canterbury. The king and the pope preferred John Ufford; but Ufford dying in May 1349, before he had been consecrated, Bradwardine was appointed archbishop, and was consecrated in July by Cardinal Bertrand at Avignon. Returning to England, he died on the 26th August in that year. Bradwardine wrote also *Arithmetica Speculativa* (Paris, 1502), *Geometria Speculativa* (ib. 1512), and a *Tractatus Proportionum* (Venice, 1505).

Brady, NICHOLAS, with Nahum Tate, versifier of the Psalms, was born at Bandon, County Cork, in 1659. He was educated at Westminster, Christ Church (Oxford), and Dublin, and held from 1696 to his death in 1726 the living of Richmond, Surrey, along with the rectories of Stratford-on-Avon and Clapham in succession. He also kept a school at Richmond, honoured by the approval of Richard Steele. Tate and Brady's metrical version of the Psalms was authorised in 1696, but with the strong opposition of many among the Tory clergy. His tragedy, *The Rape, or the Innocent Imposters*, his blank verse *Æneid*, and his sermons have long since sunk into the oblivion they deserved.

Bradyus. See SLOTH.

Braemar, a Highland district, occupying the south-west corner of Aberdeenshire (q.v.), in the heart of the Grampian Mountains, and traversed by the upper waters of the Dee. In the east part is Balmoral (q.v.); and near its centre, 61 miles W. by S. from Aberdeen, is the small village of Castleton of Braemar, a favourite resort for travellers, sportsmen, and lovers of grand scenery. Here in 1715 Mar raised the Pretender's standard.

Brag, a game at cards, so called because each player endeavours to impose upon the others, and to make them believe that his hand is better than it really is. A sum of money is usually staked, and the cards being compared, the best hand wins.

Braga, THEOPHILO, born in the Azores in 1843, was already prominent as a poet, historian, and writer on philosophy, ethnology, and other subjects when, on the revolution of 1910, he became first (provisional) president of the Portuguese republic. On the resignation of Arriaga he was again elected for the remainder of the term of office (1915). He died 27-28th January 1924.

Braga, a city of Portugal, capital of a district in Minho, is situated on an eminence 34 miles NE. of Oporto. It is the residence of the primate of Portugal, who claims to be 'primate of all the Spains.' It has also a fine Gothic cathedral (12th century), partly modernised, the church of Santa Cruz (1642), and manufactures of linen, hats, cutlery, firearms, jewellery, &c. The *Bracara Augusta* of the Romans, it retains ruins of a temple, an amphitheatre, and an aqueduct. Near it is the celebrated *Sanctuario do bom Jesus do Monte*, which is still a place of pilgrimage. In the 6th century Braga was the chief city of the Suevi, and it fell successively into the hands of the Goths and Moors, from the latter of whom it was taken by Alphonso of Castile. Pop. 25,000.

Bragança, the name of two considerable towns in Brazil. (1) Bragança, a seaport, 100 miles NE. of Pará, at the mouth of the Caete, which is navigable to the town. Pop. of town and district, 20,000.—(2) Bragança, an inland city of about 10,000 inhabitants, 50 miles to the NE. of São Paulo.

Braganza, or BRAGANÇA, a city of Portugal, capital of a district in Traz-os-Montes, on the Ferreira, 26 miles NW. of Miranda. It has an upper and a lower town, the former being surrounded with walls; has a citadel, a college, a hospital; is the see of a bishop; and has manufactures of silk and velvet. This city gives its name to the House of Braganza, the former ruling dynasty in Portugal and Brazil, John, 8th Duke of Braganza, having ascended the throne as John IV. in 1640, when the Portuguese liberated themselves from the Spanish yoke. His daughter, Catherine of Braganza, was the queen of our Charles II. See PORTUGAL. Pop. 5000.

Bragg, BRAXTON (1817-76), Confederate general, born in North Carolina, graduated at the United States military academy in 1837, served in

the artillery through the Seminole and Mexican wars, rising by successive brevets for gallantry in action to the rank of lieutenant-colonel, and retired in 1856. He commanded in several great battles of the Civil War, and was for a time military adviser to the Confederate president.—His brother, THOMAS (1810–72), was governor of North Carolina, 1854–58, United States senator, 1859–61, and Attorney-general in Jefferson Davis's cabinet, 1861–63. See *Life* by Seitz (1924).

Bragg, SIR WILLIAM HENRY, born at Wigton, Cumberland, 2d July 1862, was third wrangler at Cambridge, professor of Physics at Adelaide (1886), Leeds (1909), and London (1915). With his son WILLIAM LAWRENCE BRAGG (born at Adelaide 1890; professor of Physics at Manchester 1919) he studied crystal structure by means of X-rays. He contributed to this Encyclopædia.

Bragi, in Northern Mythology, son of Odin and Frigg, god of poetry and eloquence. Upon his tongue were engraved the runes of speech, so that he could not utter a sentence that did not contain wisdom. According to the elder or poetic Edda, he is the most perfect of all scalds or poets, and the inventor of poetry, which is designated by a kindred word, *bragr*. Unlike Apollo, who in Greek mythology enjoys eternal youth, Bragi is represented as an old man with a long flowing beard; but his brow is always mild and unwinkled. His wife's name is Idunna. Together with Hermóðr or Hermod, he receives and welcomes all those heroes who have fallen in battle, on their arrival at Valhalla. On festive occasions, as well as on the burial of a king, a goblet, called Bragafull (Bragi's goblet), was presented, before which each man rose up, made a solemn vow, and emptied it.

Braham (i.e. ABRAHAM), JOHN (c. 1774–1856), born in London of German-Jewish parents, was early left an orphan, and is said to have sold pencils in the streets, but for half a century was one of the highest reputed of tenor singers. He made a large fortune, but lost it in theatrical enterprises. His compositions are unimportant, but 'The Death of Nelson' is not yet forgotten.

Brahé, TYCHO, a great astronomer, was born at Knudstrup, near Lund, 14th December 1546. He was descended from a noble family, and was sent at the age of thirteen to the university of Copenhagen, where he had not been more than a year, when an eclipse of the sun turned his attention to astronomy. His uncle, who destined him for the law, furnished him with a tutor, and sent him to Leipzig in 1562; but Brahé, who cared nothing for that study, devoted just so much time to it as would save appearances, and while his tutor slept busied himself nightly with the stars. By these surreptitious observations of the heavens, and with no other mechanical contrivances than a globe about the size of an orange, and a pair of rude compasses, he succeeded, as early as 1563, in detecting grave errors in the Alphonsine tables and the so-called Prutenic (i.e. Pussian) tables, and set about their correction. The death of an uncle, who left him an estate, recalled him to his native place in 1565; but he very soon became disgusted with the ignorance and arrogance of those moving in the same sphere with himself, and went back to Germany. He resided for a short time at Wittenberg and Rostock, and lost part of his nose in a duel, but contrived an artificial one. After two years spent in Augsburg, he returned home, where in 1572 he discovered a new and brilliant star in the constellation Cassiopeia. In 1573 he married, or took as concubine, a peasant girl. This his fellow-noblemen thought even more undignified than being addicted to astronomy; and the king was obliged to inter-

pose in order to reconcile them. After some time spent in travel, Brahé received from Frederick II. the island of Hven or Hoene, in the Sound, as the site for an observatory, the king defraying the cost of erection, and of the necessary astronomical instruments, and providing a salary. In 1576 the foundation-stone of the castle of Uraniborg ('fortress of the heavens') was laid. Here James VI. of Scotland paid him a visit, and wrote some verses in his honour, and here for a period of twenty years Brahé prosecuted his observations with the most unwearying industry—with a zeal, in fact, sufficient to create a new epoch—one of the three great epochs indeed—in astronomy as a science of observation. See *ASTRONOMY*, *COMET*. The scientific greatness of Brahé was no protection against the petty prejudices of the nobles. So long as his munificent patron, Frederick II., lived, Brahé's position was all that he could have desired, but on his death in 1588 it was greatly changed. For some years under Christian IV., Brahé was just tolerated; but in 1597 his persecution (partly ascribed to his own arrogant ways) had grown so unbearable that he left the country altogether. After residing a short time at Rostock and at Wandsbeck near Hamburg, he accepted an invitation of the Emperor Rudolf II.—who conferred on him a pension of 3000 ducats—to Benatek, near Prague; but he died at Prague on the 24th October 1601. At Benatek his assistant was Kepler, who owed much to his advice. He did not accept the Copernican system. The scientific publications of Brahé are numerous. His complete works appeared at Prague in 1611, and another edition was begun in 1914 by J. L. E. Dreyer (Copenhagen); his *Letters* have been edited by Fijls (Copenhagen, 1876); and there are *Lives* of him by Gassendi (Latin, 1655), Fijls (Danish, 1871), and Dreyer (English; Edin. 1890).

Brahilov. See *BRAILA*.

Brahma. In the religion and philosophy of the Hindus, this word has two meanings. The crude form is *brahman*, the etymological signification of which seems to be *expansion*, with the secondary meaning of *religious devotion*. *Brahmā* (neuter) designates the universal Spirit, the ground and cause of all existence; which is not, however, conceived as an individual personal deity to be worshipped, but only as an object of contemplation. It is spoken of as 'that which is invisible, unseizable, without origin, without either colour, eye, or ear, eternal, manifold (in creation), all-pervading, undecaying—the wise behold it as the cause of created beings.' The human soul is a portion of this universal Spirit, and a man can only be freed from transmigration, and be reunited to *Brahmā*, by getting a correct notion of it and of the soul.—*Brahmā* (masculine) signifies an *offerer of prayer*, a *priest*, as well as the Supreme Being regarded as a person. In the later mythology he became the chief god of the Hindu pantheon, and is specially associated with the function of creation (see *TRIMURTI*). Yet he himself is a creation of or emanation from *Brahmā*, the First Cause. The origin of *Brahmā*, and the way in which he created heaven and earth, is thus narrated by Manu:

'This universe was enveloped in darkness, unperceived, undistinguishable, undiscoverable, unknowable, as it were entirely sunk in sleep. Then the irresistible self-existent Lord, undiscerned, causing this universe with the five elements, and all other things, to become discernible, was manifested, dispelling the gloom. He who is beyond the cognisance of the senses, subtle, undiscernible, himself shone forth. He, desiring, seeking to produce various creatures from his own body, first created the waters, and deposited in them a seed. This [seed] became a golden egg, resplendent as

the sun, in which he himself was born as Brahmā, the progenitor of all the worlds. Being formed by that First Cause, undiscernible, eternal, which is both existent and non-existent, that Male (purusha) is known in the world as Brahmā. That lord having continued a year in the egg, divided it into two parts by his mere thought. With these two shells he formed the heavens and the earth; and in the middle he placed the sky, the eight regions, and the eternal abode of the waters.'

In later times at least, Brahma has had few special worshippers, the only spot where he is periodically adored being at Pushkara in Rajputana. He sometimes receives a kind of secondary homage along with other deities. Brahma is represented with four heads. See INDIA (section on *Religion*), TRIMURTI, VISHNU, SIVA.

Brahman, or **BRAHMIN**, the name of the highest Caste (q.v.) in the system of Hinduism. For Brahminism, see INDIA.

Brahmanbaria, a town of India, Tipperah district, in the presidency of Bengal, on the Titus River, 230 miles NE. of Calcutta, with which it has communication by rail and river. There is a large trade in rice. Pop. 22,300.

Brahmaputra ('son of Brahma'), one of the great rivers of India, rises, as the Kubi-Tsangpo, at the foot of a glacier on the slopes of the Kubi-Gangri, in Tibet, 15,958 feet above sea-level, close to the source of the Sutlej, and not very far from those of the Indus and the Ghāgra. For 800-900 miles the Tsangpo flows eastwards through Tibet, in the trough between the Himalaya and Trans-Himalaya, leaving Shigatze a little to the south and Lhasa to the north on tributaries. In a late geological period it is believed to have continued in this direction towards China, but the formation of north-and-south folds of mountains stretching from eastern Tibet into Burma diverted its course. It accordingly bends somewhat tortuously, but in a general south-easterly direction, round the eastern flank of the Himalayas (Namcha Barwa, 25,445 feet), through a gorge unexplored till 1913, and enters the valley of Assam as the Dihang. Receiving the Dibang and the Luliit at the head of the valley, it flows south-west and west for 450 miles between the forest-clad lower slopes of the Himalayas and the Khasia and Garo plateau. Some distance down the valley it receives the Subansiri from Tibet, and the united stream is believed to have a flood discharge of over 500,000 cubic feet per second. Enormous quantities of fertilising silt brought down from the Himalaya are deposited in banks and islands that are subject to constant change, though the valley is not wide enough to allow changes of such magnitude as occur in the delta. The channel divides up into a network of branches, running upon an elevated platform of alluvium, and bordered by great stretches of swamp which become a continuous sheet of water in the rainy season. Emerging upon the plains of eastern Bengal, the river turns southwards round the western end of the Khasia Hills, and, under the name of Jamuna, flows 180 miles to Goalanda, where it unites its delta with that of the Ganges. The Surma, from Cachar in southern Assam, joins the main stream of the united rivers to form the Meghna, which, 75 miles below Goalanda, opens out into the Bay of Bengal. The Brahmaputra is navigable for steamers as high as Dibrugarh in Upper Assam, 800 miles from the sea. By far the most important export traffic in Assam is that in tea; but large quantities of timber, rubber, and cotton are also sent down the river. The overflow of the Brahmaputra upon the plains renders artificial irrigation unnecessary, and enables

abundant crops of rice to be grown. This is largely sent up-stream to the tea-estates. The gold found in the Tertiary deposits and alluvial beds of the Dihang and its affluents has long been famous. That of the main stream is probably brought down from crystalline rocks in its upper reaches in Tibet. For the upper valley and the discovery of the source, see HEDIN, *Trans-Himalaya* (1909).

Brahma Samāj (i.e. 'Church of the one God,' 'Theistic Church') is a religious and social association in India, originated by the celebrated Hindu raja, Rammohun Roy (q.v.), in 1830, under the title *Society of God*. The accession of Debendranath Tagore, a wealthy Calcutta Brahman, in 1842, gave the movement a great impetus, which was also much aided by the spread of English education. Its main development took place under Babu Keshub Chunder Sen, born in 1838, who died in 1884. He joined the new church in 1858, and visited Europe in 1870. It was his aim to apply the principles of the church to practical life, and under his leadership the progressive party seceded from the original church, and assumed the title of 'Brahma Samāj of India.' Their fundamental principles are that there is but one Supreme God, the object of worship; that nature and intuition are the sources whence our knowledge of God is derived; they reject all special revelation, and hold that religion admits of progressive development. They ignore all distinctions of caste, and consider all men as God's children; they abjure all idolatrous rites, and acknowledge no sacred books or places, but value what is good and true in all religions, and recognise the necessity of public worship. They have reformed marriage customs and promoted female education. Keshub believed himself to be a prophet and proclaimed the 'New Dispensation,' which in some respects approximated to Christianity, but in his later years he inclined more to mysticism, pantheism, and Yogaism. Many of his followers resented the inevitable inconsistencies of his eclectic theology and his too autocratic rule; and when, in defiance of the accepted principles of the society, he married his fourteen-year-old daughter to a Hindu raja, a large section seceded and founded the Sadharana (Universal) Brahma Samāj, the most progressive school or division. The original and most conservative section, dating from before Chunder Sen's adhesion, still lived on; and though after his death (1884) the three—or with the small Prarthana Samāj in Bombay, four—Samājes resumed more friendly relations, the results have fallen far short of the founder's hopes and friends' expectations. In Rabindranath Tagore, the greatest living poet of India, the Brahma Samāj has contributed also to English poetry.

The Brahma Samāj must be distinguished from the newer but vastly larger Arya Samāj (q.v.), but they have a Vedantic Unitarianism in common. And the effect of both has been, in the opinion of the best observers, to bar the way to the evangelisation of educated India.

See books by and about Rammohun Roy (q.v.) and Chunder Sen; F. Lallington, *The Brahma Samāj and the Arya Samāj* (1901); Pandit Sivanath Sastri, *History of the Brahma Samāj* (2 vols., Calcutta, 1912); J. C. Oman, *The Brahmans, Theists, and Muslims of India* (1907); Hastings's *Encyclopedia of Religion and Ethics* (1912). For the Vedantic and Indian philosophy on which they base, see SANSEKRI, INDIA (*Religion*).

Brahmin Ox. See ZEBU.

Brahms, JOHANNES, was born on 7th May 1833, in Hamburg. His father, Johann Jacob Brahms, a Holsteiner and an enthusiastic professional musician, settled in Hamburg (1826), where he married (1830) Johanne Henrika Cristiane Nissen, a woman of little education and nearly

seventeen years his senior, but a devoted wife and mother. Johannes, the second of three children, received his musical education from his father, Otto Cossel, and Eduard Marxsen, a noted teacher and composer of the day. In 1847-49 Brahms made several public appearances, and gained a considerable reputation as a pianist. From childhood he tried his hand at compositions and arrangements, but his first works of importance date from the early 'fifties, to which years belong the E flat minor Scherzo, Sonatas C major and F sharp minor for pianoforte, and such well-known songs as 'Liebestreu' and 'Heimkehr.' Many of his earlier MSS. were signed E. W. Marks, Karl Wuth, or Johs. Kreisler, jun. In 1853 the Hungarian violinist, Eduard Reményi, undertook a concert tour with Brahms as accompanist. Thanks to Joachim, Reményi and his accompanist received a cordial welcome from Liszt at Weimar. Brahms then spent some weeks with Joachim in Göttingen, where were laid the foundations of a lifelong and ideal friendship.

Aimed with an introduction from Joachim (ever eager to promote his friend's musical fame and material welfare), Brahms visited Robert and Clara Schumann in September at Düsseldorf. Schumann, all enthusiasm, contributed a historic article, 'Neue Bahnen,' to the *Neue Zeitschrift für Musik* (23d October 1853), in which he hailed Brahms as the coming Messiah in music. This panegyric inevitably alienated the New-German party, of which Liszt was a leader, and for some time at least Schumann's kindness did Brahms more harm than good. Ere the year was out the young composer for the first time found a publisher (at Leipzig). In 1854 he settled at Hanover, where he finished his beautiful B major trio (the first of a series of great chamber works) and attempted a symphony; the failure of the latter, which eventually became part of the D minor pianoforte Concerto, caused him to apply himself for several years to a strict course of study before giving the world any new compositions. From 1857-60 he held the posts of director of the court concerts, and conductor of the choral society at Detmold. His performance of the now well-known D minor pianoforte Concerto at Leipzig in 1859 was 'a complete and brilliant failure,' as he himself reported to Joachim. Not till many years later did this interesting work, which boldly disregarded the traditional concerto form, receive the appreciation it deserved. This rebuff stimulated and in no wise daunted Brahms, who declared: 'Nevertheless the concerto will some day be a success.'

In 1862 Brahms paid his first visit to Vienna. The Austrian capital greatly attracted him, and soon became his permanent home, his hopes of being appointed conductor of the Hamburg Philharmonic Society never being fulfilled. He accepted the leadership of the Vienna Singakademie in 1863, but resigned after one season's work. In 1872-75 he conducted the concerts of the Vienna Gesellschaft der Musikfreunde. In striking contrast with Wagner, Brahms led a retired and placid life. An occasional concert tour or holiday trip (to Baden-Baden, the Austrian Alps, Italy, &c.) alone interrupted the even tenor of his life and work at No. 4 Karlsplatz, Vienna, where he resided for over a quarter of a century. Fame and honours, however, came unsought. In 1879 the degree of Ph.D. was conferred upon him by Breslau University; in 1887 he was created Knight of the Order Pour le Mérite; in 1889 he received the freedom of his native city; Cambridge offered him an honorary degree, but Brahms could never be persuaded to visit England. He died of cancer of the liver on 3d April 1897, and was buried in the Central Cemetery, where Beethoven and Schubert also lie.

A man of high ideals and admirable character,

Brahms was modest, contemplative, and reserved, and disliked publicity of any kind. Behind an abrupt and somewhat irritable manner lay a kind and generous nature, a genuine capacity for friendship (witness his relations with Joachim, the Herzogenbergs, and the Schumanns), and a well-balanced and healthy mind. Brahms never married; he was, however, exceedingly fond of children. A great lover of nature (as his music amply proves), he was an early riser and an enthusiastic walker. His constitution was remarkably robust. Of medium height and square build, Brahms had a great impressive head with lofty brow and keen blue eyes.

His arrival in Vienna inaugurated the most fertile and brilliant period of his career. Before that date his only works for orchestra alone were the two serenades (published 1860). The next ten years were marked by a series of masterly chamber compositions and vocal works—e.g. string sextet, op. 18; quartets, op. 25, 26; the fifteen Magelone Romances, op. 33; pianoforte quintet, op. 34; horn trio, op. 40; and three songs for six-part chorus, op. 42. The first performance of the imposing German Requiem, a work in seven movements for soli, chorus, and orchestra, took place in Leipzig in 1869, and won for Brahms an undisputed place in the front rank of composers. The 'Rhapsodie' (1870), the 'Triumphlied' (1871), written in honour of German victories, and the sublime 'Schicksalslied' (1871) completed the period of Brahms's greatest choral works. His first symphony (C minor) was produced in Carlsruhe, 1876 (pub. 1877), and was followed immediately by the second symphony (D major), performed in Vienna, 1877. The former aroused considerable controversy at the time, but is now regarded by many as his finest symphony; perhaps nowhere else does Brahms reveal such mighty power of construction, such a careful choice and logical development of his themes. Amongst the most notable of the compositions which now appeared are his solitary violin concerto, first performed by Joachim in Leipzig, 1879, the delightful sonata in G major for pianoforte and violin, the 'Academic' and 'Tragic' overtures, and the exacting pianoforte concerto in B flat, op. 83.

Many of the master's most ambitious works were produced in pairs. His last two symphonies, like his first two, followed closely one upon the other—the F major performed in Vienna, 1883, the E minor in Meiningen, 1885. The intervening period was prolific in vocal works. The E minor symphony, with its unsurpassed fourth movement in passacaglia form, is the last of Brahms's compositions for orchestra alone. Besides this monumental movement, the famous Handel Variations and Fugue, op. 24, variations on an original theme, op. 21, for pianoforte, and the orchestra variations, op. 56, among others, make him pre-eminent as a writer of variation form. Brahms's last ten years, like the decade 1861-70, were particularly rich in exquisite chamber compositions and songs, and yielded, *inter alia*, the double concerto for violin and violoncello with orchestra accompaniment, op. 102, the well-known pianoforte pieces, op. 116-119, the four serious songs for bass, published a year before his death, and the eleven Choralvorspiele for organ (his only posthumous work).

During his lifetime Brahms met with more recognition than has been the lot of many master musicians, and then, as now, the best judges agreed that he must be assigned a place among the great classical composers. His name is often, and not unwarrantably, bracketed with those of Bach and Beethoven, who with Mozart were his constant exemplars. By dint of ceaseless self-criticism he became unimpeachable in form and manner of construction. To the technical skill of his compositions

were added a poetic unity, a depth and purity of conception, and a rich store of thematic material. It is especially in his symphonies and in his beautiful chamber-music that he combines so wonderfully the classic form with the modern spirit. As a song-writer he ranks with Schubert and Schumann. Such masterpieces as 'Feldeinsamkeit,' 'Mainacht,' 'Von ewiger Liebe,' 'Botschaft,' 'Auf dem Kirchhofe,' illustrate his genius for expressing a mood in music. Altogether he wrote nearly 200 lieder, besides 49 volk-lieder and 14 volks-kinderlieder. For German folk-songs (as for Strauss waltzes) Brahms always had an intense liking. He never attempted an opera, as he could not find a libretto to his satisfaction.

Among the most striking peculiarities of Brahms's music are his frequent use of syncopation and of conflicting rhythms, and his partiality for themes built on the notes of the tonic chord. These characteristics, together with his power of condensation, his exhaustive treatment of his material, his eschewing of the purely sensuous side of music, and perfect control of the emotions by the intellect, his invariable refusal to forsake classical ideals and pander to popular tastes, may render some of his works cold, obscure, or monotonous to the average listener; but to the initiated Brahms will ever appeal as the 19th century's greatest exponent of absolute music after Beethoven.

The standard German biography is Max Kalbeck's, in 4 vols (1904-14). See also Florence May, *Life*, 2 vols. (1905); E. Evans, sen., *Historical, Descriptive, and Analytical Account of J. Brahms's Works* (1912 et seq.); studies by J. A. Fuller-Maitland (1911) and E. Markham Lee (1916); and Brahms's Correspondence with Joachim, the Herzogenbergs, and others (*Briefwechsel*, 7 vols. 1907-12). The *Herzogenberg Correspondence* appeared in English in 1909.

Brahui, a people of Beluchistan, whose affinities are obscure. See BELUCHISTAN.

Braid, JAMES, born in 1795 in Fife, studied medicine at Edinburgh, and settled as a surgeon in Manchester, where he died, 25th March 1850. He is noted for his researches on Animal Magnetism (q.v.), which he called Hypnotism (q.v.).

Braidwood, THOMAS, born in 1715, studied at Edinburgh University. He settled as a school-master in Edinburgh, and after 1760 became famous as a teacher of the Deaf and Dumb (q.v.). His school, which was visited by Dr Johnson, was afterwards transferred to Hackney, London, where Braidwood died, 24th September 1798.

Braila, or BRAILOV, a river-port of Rumania, on the left bank of the Danube, 10 miles above Galatz, and 142 NE. of Bucharest by rail. A free port till 1883, it exports large quantities of coin, timber, petroleum, and other products. Of its churches the chief is the Orthodox cathedral. The fortifications were dismantled in 1828. There are mineral springs in the neighbourhood. Braila was burned by the Russians in 1711, and Gortschakoff crossed here in 1854. Pop. 66,000.

Braille, LOUIS. See BLIND.

Brailsford, HENRY NOEL, author and journalist, born at Mirfield in 1873, studied at Glasgow, where he became lecturer in logic; wrote for the *Manchester Guardian*, *Tribune*, *Daily News*, and *Nation*; was Labour candidate for Montrose burghs (1918); and in 1922 became editor of the *New Leader*. His books include *Macedonia* (1906); *Shelley, Godwin, and their Circle*; *The War of Steel and Gold* (1914); and other works on international questions and war.

Brain is the term applied to that part of the central nervous system which in vertebrates is contained within the cranium or skull. In the invertebrata it is represented by the nervous ganglia near

the head end of the body. The human brain is enveloped by three membranes—the *Dura-mater*, the

the brain, and also contain a clear fluid—the cerebro-spinal fluid—which removes the products of

brain waste, and at the same time serves, like a water cushion, to diminish the effect of external shocks. Brain substance is composed of *gray* and *white matter* (with some connective tissue and blood vessels). The gray matter consists of *nerve cells*, which are minute structures, variously shaped communicating by numerous fine processes with *nerve fibres*. These cells discharge nerve impulses to, and receive impressions from nerve fibres. The white matter is composed nearly entirely of white medullated nerve fibres, whose function is to transmit nerve impulses from one point to another. The relations of the gray and white matter vary greatly in the different parts of the brain. The main divisions of the brain are the *cerebrum* (great brain or cerebral hemispheres), the *cerebellum* (with the *pons Varoli*), the *optic lobes* (*corpora quadrigemina*, with the *crura cerebri*), and the *medulla oblongata*. An examination of figs 1, 2, 3, 5, from different aspects of the human brain will convey an idea of the relative size and position of these parts. The cerebrum underlies the whole vault of the cranium, and covers all the rest of the brain when seen from above (fig 1). Below its posterior extremity, and separated from it by a fold of dura mater, is the cerebellum. Below the cerebellum, again, lies the medulla oblongata, which is continuous, through an opening in the base of the skull called the foramen magnum, with the

fissure, at the bottom of which lies a great transverse commissure, the *corpus callosum*. The hemispheres are covered with a thin layer of gray matter (or nerve cells), and thrown into ridges and furrows (technically called convolutions or gyri and fissures). These seem (fig 1) to be arranged without any definite order, but Gratiolet, by comparing the simpler brains of monkeys and of the human embryo, discovered that certain fissures ('primary' fissures) were

Fig 4—Lateral (A) and median (B) surface of the Brain of the Human Embryo, to show the simple Convolutions and the primary Fissures (Mihalkovics)

The lines AB and CD show the position of the sections in figs 6 and 7 respectively

Spinal Cord (qv) The medulla passes directly upwards into the protuberance called the pons Varoli, which is connected by the crura cerebri or cerebral peduncles with the cerebrum. Behind the crura cerebri, in the angle between the cerebrum and cerebellum, lie the optic lobes (*corpora quadrigemina*). The cerebrum consists of two nearly equal *hemispheres*, divided by a deep median

always present. There are, on the outer surface, the *fissure of Sylvius* (*fs*), the *fissure of Rolando* (*fr*), and on the inner surface the *parieto-occipital* (*po*). These fissures form the boundaries of the various lobes of the cerebrum. (1) The *frontal lobe* (FL) is that part of the outer surface, and the corresponding part of the median surface, which lies anterior to the fissure of Rolando. (2) The *temporo-sphenoidal lobe* (TL) lies below the fissure of Sylvius. (3) The *occipital lobe* lies behind the parieto-occipital fissure, and includes the corresponding parts on the outer surface. (4) The *parietal lobe* is bounded by the fissures of Rolando and of Sylvius, and by the occipital lobe. (5) The *island of Reil* lies at the bottom of the fissure of Sylvius (*v*, fig 4), and is obscured in the adult by the adjacent lobes. Secondary fissures on these lobes divide them into *convolutions*. Thus (fig 5) on the frontal lobe, we have the first (*F*₁), second (*F*₂), third (*F*₃), and ascending (*af*) frontal convolutions, on the temporo-sphenoidal, the first (*T*₁), second (*T*₂), and third (*T*₃) temporal convolutions, on the parietal, the ascending (*ap*), postero-parietal (*pp*), angular (*13*), and supra-marginal (*13*) convolutions. On the median surface (fig 3) we have the *marginal convolution*, the *gyrus fornicatus* (*gf*) immediately above the corpus callosum, and the gyrus hippocampi, &c. On the under surface of the cerebrum we see the two olfactory lobes (nose brain) (1) and the two optic nerves (2). The latter, crossing like the letter X, wind round the two cerebral peduncles (*cp*), to terminate in the optic thalami and optic lobes. These peduncles are seen passing from the under surface of the hemispheres, and approaching each other as they enter the pons Varoli. If we press apart the two cerebral hemispheres, we come upon the corpus callosum (*cc*, fig 3). This is a band of white fibres that probably connects corresponding convolutions of both hemispheres. On dividing this and removing some white fibres (the fornix, fig 3, *f*), and a layer of connective tissue (velum interpositum), with its vascular margin (the chooid plexus), we expose the *ventricles* of the cerebrum—viz the two lateral and the third ventricles. The former occupy the hemispheres, the latter lies between them, and is continued backwards through a narrow channel (the *aqueduct of Sylvius*) into the fourth ventricle,

which lies behind the pons Varoli and medulla (figs 6, 7, 8). Projecting into the third and lateral ventricles are rounded masses of gray matter, the *corpus striatum* and *optic thalamus*, often called the *basal ganglia* (figs 6, 7). A better idea of the

relation of all these parts will be gained by studying the two transverse sections (figs 6 and 7) made in the direction of the dotted lines AB and CD in fig 3. Surrounding the whole cerebrum is the thin convoluted envelope of gray matter, about a quarter inch thick. Within this lies the *centrum ovale* composed of white fibres. Connecting the two hemispheres is the corpus callosum (*cc*) with, underneath it, the *septa lucida* and *fornix* (fig 7). Projecting into the ventricles are the ovoid optic thalamus and the caudate nucleus (*cn*) of the *corpus striatum*. A wedge shaped mass of gray matter (*ln*), the *lenticular nucleus* of the corpus striatum, is separated from the first two nuclei by a band of white fibres, the *internal capsule* (*ic*), which in fig 6 we see to be composed of two parts, an anterior limb and a posterior limb, which meet each other at an obtuse angle (the knee). Immediately outside the lenticular nucleus is the white *external capsule* (*ec*), separated by a thin band of gray matter, the *claustrum*, from the island of Reil (*ir*). The *centrum ovale* consists of nerve fibres passing in various directions, very difficult to unravel from each other. Certain of

them pass between adjacent convolutions, others again connect parts at a distance, such as the frontal and occipital lobes many cross by the corpus callosum to end probably in corresponding convolutions of the opposite hemisphere. Others connect the basal ganglia with the cortical gray matter. From the internal capsule an important group, known as the *corona radiata* (see fig 7), passes to the whole of the cortex. That part of the corona radiata entering the occipital lobes is called the optic radiation of Gratiolet, who considered it to be the central expansion of the optic nerve (*or*, fig 6).

The *optic lobes* consist of two (anterior and posterior) pairs of rounded eminences of gray matter (figs 3 and 8) situated close to the optic thalamus, and underlying the pineal gland. They are very intimately connected with the optic nerves part of these ending in the anterior pair, and also to the third and fourth nerves, whose nuclei of origin lie just underneath them in front of the aqueduct of Sylvius (3 fig 8). The *crura cerebri* are formed of fibres passing down from the cerebrum to the pons, medulla and cord (see fig 3) and of others passing up from the medulla and cord, and from the cerebellum (superior peduncles) to the cerebrum.

The *cerebellum* possesses a median and two lateral hemispheres which have been subdivided into lobes (figs 2 and 3). Its parts are arranged in thin laminae or folia with deep intervening fissures

Fig 6—Transverse Section of Cerebrum in plane of line CD (fig 3) (Original drawing)

FL frontal, TL temporal, OL occipital lobes, *fs* fissure of Sylvius, *ir* island of Reil, *cn*, caudate nucleus, *ln1*, *ln2*, *ln3* the three divisions of the lenticular nucleus, *ic*, anterior limb of internal capsule, *ec* posterior limb of internal capsule (the anterior part conveys motor, the posterior sensory fibres) the part generally injured in cerebral hemorrhage, *ot*, optic thalamus, *or* optic radiation, probably conveys sensory fibres to occipital and temporal lobes, *ac* anterior commissure connects both temporal lobes, *f* fornix, *pc* posterior commissure, *pg* pineal gland, *lv* lateral ventricle (posterior horn)

These laminae have a central core of white matter with a thin covering of gray matter. Sections through them recall the appearance of a tree and its branches (hence the term *arbor vitae*). The cerebellum has three pairs of *peduncles* (fig 8)—(*a*) superior, which pass upwards and across the middle line towards the opposite cerebral hemisphere, but ending under the optic lobes, (*b*) middle, which form the main part of the pons Varoli, and which enter indirectly into connection with fibres from

the opposite cerebral hemisphere; (c) inferior (the *restiform body*), which is connected with the medulla and Spinal Cord (q.v.). There is also an intimate connection by the auditory nerve with the semicircular canals of the ear.

Fig. 7.—Vertical transverse Section of Brain in direction of line AB (fig. 3) (Original drawing):

The shaded outline of the cerebrum indicates the superficial gray matter.

se, fissure of Sylvius; *v*, island of Reil, a convolution at the bottom of the fissure of Sylvius concealed in the adult; *cc*, corpus callosum, the transverse interhemispherical commissure; *lv*, lateral ventricle; *f*, fornix, divided transversely between the fornix and the corpus callosum are seen the thin septa lucida; *cn*, caudate nucleus; *ln*, lenticular nucleus (with its three divisions); *ot*, optic thalamus; *ec*, external capsule, and outside it a layer of gray matter, the claustrum; *pv*, pons Varoli; *mo*, medulla oblongata; *oi*, inferior olivary body; *cb*, cerebellum; *l*, *a*, *f*, *s*, mark the origin of the dotted lines representing motor fibres passing from the leg, arm, face, and speech 'centres,' through the internal capsule, cerebral peduncles, pons Varoli, medulla oblongata, and crossing at *dp*, the decussation of the pyramids to the opposite side of the spinal cord (to explain crossed paralysis). Another dotted line passes from *s* (speech centre) to hearing centre in first temporal convolution.

The *Medulla Oblongata* is the lowest division of the brain. It has a somewhat conical form, with the base towards the pons Varoli, the narrow end towards the spinal cord. On the under surface, on each side of the middle line, are the *anterior pyramids* decussating with (crossing) each other where the medulla passes into the spinal cord. External to them is an ovoid projection, the *olivary body* (fig. 2). On the dorsal aspect is the lozenge-shaped fourth ventricle, which is bounded below by the two inferior and above by the superior peduncles of the cerebellum. All the cranial nerves below the fourth originate from the floor of the medulla in the positions marked by the numbers on the right side of fig. 8. Their points of emergence on the under surface are indicated in fig. 2.

SIZE OF BRAIN—The brain of the male has an average weight of 49½ ounces, that of the female is about 5 ounces lighter. Cuvier's brain weighed 1861 grammes (1 gramme is 15½ grains), Turgenieff's 2012 grammes. On the other hand, Virchow has found a brain weighing 1911 grammes in a man without any specially high mental development, and the brains of some very able men have been found below the average weight. Too much stress has been laid upon the connection of mental capacity with brain weight in individual instances. Still the general fact is that the most highly developed races have the heaviest brains.

FUNCTIONS OF THE CEREBRUM.—If we remove the cerebral lobes from an animal, we deprive it of

its volition and its intelligence. We may leave it capable of performing very complex movements, almost, if not quite, as perfectly as before; but we have destroyed its power to initiate these movements, we reduce it to the condition of a responsive machine. Thus a frog without its cerebrum will, if undisturbed, remain motionless for an indefinite time. If it be placed on a board, and the board tilted, it will change its position till its equilibrium is stable, and then it becomes motionless. If put into water, it will swim, and if a piece of wood be put before it, it will climb up on it, and there remain; if it be pinched, it will spring and will avoid any obstacle placed in its way, just as an entire frog would. A pigeon similarly treated becomes drowsy and stupid. If food be placed before it, it will not take it; it exhibits no sign of terror at what would otherwise cause it alarm, further than to start slightly at a loud sound, or a bright light. But if thrown into the air, it will fly to a convenient resting-place; if placed on its back, it will regain its feet, and thereafter become drowsy again.

Fig. 8.—Medulla Oblongata with Corpora Quadrigemina seen from behind (Cerebellum cut away) (Landois):

ot, optic thalamus; *pg*, pineal gland; *cqa*, anterior corpora quadrigemina; *cqp*, posterior corpora quadrigemina; *sp*, superior cerebellar peduncle; *mp*, middle cerebellar peduncle, goes to pons Varoli; *ip*, inferior peduncle, or restiform body, goes to medulla oblongata and spinal cord; *fg*, funiculus gracilis, or column of Goll; *nfg*, nucleus of the funiculus gracilis; *fo*, funiculus cuneatus, or column of Burdach; *nfo*, nucleus of the funiculus cuneatus. The lozenge-shaped area in the centre of the figure is the fourth ventricle. The numbers 4-12 indicate the superficial roots of the corresponding cranial nerves. The numbers 3'-12', their nuclei of origin.

Similar experiments on other animals show similar results. In man we find that imperfect development of the cerebrum is accompanied by imbecility and idiocy, and that the races that have the heaviest cerebra and the most fully developed convolutions are the most intelligent. Among animals, again, the degree of intelligence increases with the increase in size of the cerebrum relatively to the other parts of the brain.

Flourens, the great French physiologist, held that the *whole* of the cerebrum was employed in *every* mental process. He removed parts of the hemispheres of pigeons, and came to the conclusion that *all* the mental functions became enfeebled, and that to an equal degree, in proportion to the amount of brain matter removed, no matter from what part of the cerebrum it were; and that as long as any part of the gray matter remained, so

long could mental functions be carried on. This doctrine long held the field. It seemed to explain why large masses of brain substance could be removed by injury without apparent effect on the mind, and why there was no constant relation between symptoms and locality of brain lesions. But it did not explain all the facts. The condition of *Aphasia* (q.v.), or loss of articulate speech, was found to be almost constantly associated with a certain convulsion, and certain paralysis and limited convulsive phenomena were found by Hughlings Jackson to be apparently due to definitely localised lesions. In 1870 Fritsch and Hitzig, two German observers, discovered that when certain areas of the cerebral cortex were stimulated by the galvanic current, movements of the opposite side of the body were produced. This discovery put the question of cerebral localisation on a new footing. Ferrier repeated and extended their results, and soon succeeded in mapping on the brains of animals (rabbits, dogs, and monkeys), areas, stimulation of which by the faradic current produced movements which corresponded to the areas as accurately as the notes correspond to the keys of a pianoforte. A great controversy immediately arose as to the meaning and value of these discoveries, the result of which has been to substantiate their accuracy, and to lead to their extension. Ferrier's 'motor areas' (see fig. 5) lie on either side of the fissure of Rolando, and extend into the postero-parietal and part of the first, second, and third frontal convolutions. The lower part of the area corresponds to the movements of the face and tongue; the intermediate parts to those of the arm; the upper to those of the leg. A centre for the muscles of the trunk, arm, and leg has been found on the marginal convolution (on the median aspect of the parietal lobe); and Ferrier's areas have been further subdivided, so that centres for such fine movements as, e.g., the apposition of the forefinger to the thumb have been mapped out on the brain of the monkey by Horsley, Schäfer, and others. A knowledge of the correspondence between the convolutions of the simian and the human brain, and of the relation of the convolutions of the latter to the bones of the skull (see fig. 5), has already led to the successful removal of tumours whose seat was indicated by definite motor disturbances. When these areas are destroyed by disease, the power of the corresponding voluntary movement or movements is lost. When they are irritated, corresponding spasms of movement are set up (Jacksonian epilepsy). The motor area is now known to be situated in front of the fissure of Rolando only.

Aphasia.—The left hemisphere controls the right side of the body, and as we are mostly *right-handed*, so we are *left-brained*. When the posterior end of the third frontal convolution on the left side is destroyed, *aphasia* results. An aphasic person understands what is said to him, but has lost the power of articulate speech—the words wanted are either forgotten or cannot be uttered, and this although the muscles of articulation are unimpaired. They cannot be co-ordinated. In *left handed* individuals aphasia has been found associated with the corresponding lesion on the right side of the cerebrum. The third left frontal convolution is said to be well developed in the brains of remarkable men, and to be very simple in deaf-mutes, and quite rudimentary in idiots. The corresponding condition of *agraphia*, or inability to express one's self intelligently by writing, has been recently found associated with lesions of the posterior end of the second frontal convolution.

Aphasia may be divided into two components, the motor and the sensory. Speech is the response to things heard or things seen. In the auditory

and visual areas on one side there is an area for words heard and for words seen. Injury of either of these areas produces *word deafness* or *word blindness*. In the former case the injured person is unable to speak in response to conversation because he has lost the power of understanding spoken words; in the latter case he cannot reply to anything written. Disease of Broca's area produces *anarthria*, or paralysis of articulation, as it is in this area that the motor centres for these muscles are situated; but in front of this area is a small psychomotor area which arranges the thoughts which the motor area then gives expression to, and if this be destroyed the patient loses the power even to form anything to say.

Cortical Sensory Areas.—The determination of the existence of definite areas for the conscious perception of the different forms of sensory impressions is much more difficult than that of the motor areas, and physiologists are yet far from being agreed on many points.

Centre for Sight.—Munk places this centre in the occipital lobe; destruction of one lobe produces permanent blindness in one side of both eyes (what is called homonymous hemianopsia). Histological examination of the visual area in the occipital lobe shows that it may be divided into two portions, termed the *visuo sensory* and the *visuo-psychic*. The visuo-sensory portion receives the stimuli from the eye, and passes them on to the visuo-psychic part where they are stored up. A fresh stimulus reaching the visuo sensory area can then be compared with the previous stimuli stored up in the visuo-psychic portion. In man, disease of the left angular gyrus produces what is called *word blindness*. In this condition one loses the power of reading words, although one sees the characters distinctly, and may even be able to spell the word. One may even retain the power of writing spontaneously or from dictation, and yet be unable to read what has been written. It may be compared to the condition where one has completely forgotten a foreign language; one can write or read the words, but has absolutely lost their meaning. Recent investigation seems to show that the occipital lobes alone are the centre for sight, each lobe being connected with the corresponding lateral halves of the two eyes.

Centre for Hearing.—This seems to lie in the first temporo-sphenoidal convolution in both sides. In man, partial destruction of this convolution on the left side causes the condition of *word-deafness* (where one hears the sounds, but has absolutely lost their meaning).

Centres for Taste and Smell.—Ferrier locates the former of these in the uncinate gyrus (on the inner surface of the temporo-sphenoidal lobe).

Centres for Touch (common sensibility).—These lie in the post-central gyrus immediately behind the fissure of Rolando, the sensory area for each limb lying behind the corresponding motor area. Injury produces a symptom termed *astereognosis*, an inability to recognise by touch objects placed in the opposite hand. Its function is the (a) recognition of spacial relations, (b) graduated response to stimuli of different intensity, and (c) appreciation of similarity and difference in external objects brought in contact with the surface of the body. A prick is felt, as far as the painful element is concerned, by the optic thalamus, while the pointedness, clearness, and sharpness are the results of cortical activity.

Frontal Lobes.—No definite result follows from the experiments made on the anterior part of the frontal lobes; but it is probable that they are associated with the exercise of the higher mental faculties. They are well developed in highly intelligent individuals, and *vice versa*. The frontal lobes contain the motor and psychomotor areas.

The cerebrum may be regarded as divided into two portions by the fissure of Rolando. The anterior part is motor, the posterior part sensory. The sensory portion receives sensory stimuli in the appropriate sensory area, and interprets them by means of the corresponding psychic area. These stimuli are then brought into association with each other by the process of cerebral association which is carried out by the great silent areas of the brain lying between these areas, and known as the areas of cerebral association. When all these receptive impulses have undergone association, they pass to the frontal area, where they are utilised for expression. The motor area does not appear to be able to originate any motor stimulus; this is done by the psychomotor area, which, after it has arranged what the motor response is to be, touches off, as it were, the proper motor centre. It is thought that the prefrontal area has the highest function of all, as it appears to be able to exercise selective or voluntary associative functions.

Basal Ganglia—Corpus striatum.—The corpus striatum appears to act as the motor centre in lower vertebrates. In man, however, it is not excitable, is independent of the cerebral cortex, is not able to take over the function of the cortex if this be destroyed, and is not directly connected with the spinal cord. It is found, however, that when it is diseased involuntary movements take place. These are of two kinds, (1) fine tremors as in paralysis agitans, and (2) coarse movements as in chorea and athetosis. From this it is thought that the corpus striatum has a connection both with the cerebral cortex and with the spinal cord, and that its function is to steady the impulses passing from the cortical motor area by means of the pyramidal or cortico-spinal tracts to the spinal cord and on to the muscles. These voluntary impulses appear to require steadying, and if the steadying influence of the corpus striatum be removed involuntary movements occur, coarse in character if the cortical connection be damaged, and fine tremors if the connection with the spinal cord be injured.

Optic Thalamus.—This is the sensory end-station of lower vertebrates. In man, injury to the optic thalamus is followed by loss of sensation on the opposite side of the body. There is, however, a further end-station in man, namely, the post-central gyrus of the cerebral cortex. We now know that the optic thalamus is the centre for the affective aspect of sensation, and is associated with the crude recognition of touch, pain, heat, and cold.

Cerebellum.—Flourens considered that the function of the cerebellum was to co-ordinate voluntary movements. He found that removal of superficial layers in a pigeon caused slight weakness and disharmony of movement; that further removal caused general agitation, and finally loss of ability to stand or fly or walk. It could not rise when placed on its back. But it was not paralysed, it made continual ineffectual struggles to recover its position, and only ceased when completely exhausted. There was no loss of volition or intelligence. It could see and hear and feel quite well. Disease of the human cerebellum, however, when it causes symptoms, does not cause general inco-ordination, but merely a staggering gait like that of intoxication, and a feeling of giddiness. Ferrier holds that it is the centre for co-ordinating movements necessary for the equilibrium of the body, and that its different parts control different sets of these movements. For instance, destruction of the anterior part of the median lobe causes tendency to fall forwards, loss of its posterior part causes tendency to fall backwards, and of one lateral lobe a tendency to rotate towards the side injured. Stimulation of any one of these parts causes movements of the head, eyes, and limbs, such as would

counteract the disturbance of equilibrium produced by the destruction of the part. The anatomical connections of the cerebellum, with the semicircular canals of the ear, seem to point to the same conclusion. In birds, where muscular co-ordination is so essential for flight, the cerebellum is large. The cerebellum is related to the opposite side of the cerebrum, but to the same side of the body.

The *Medulla Oblongata* is the great seat of the centres for the functions of organic life, as may be understood from the fact that it gives origin to all the cranial nerves, except the first four pairs (see fig. 8). The various centres are: (1) The centre for respiratory movements, near the lower extremity of the fourth ventricle; (2) for the inhibition (or restraint), and for the acceleration of the movements of the heart; (3) for the control of the blood pressure (vaso-motor centre), including the 'diabetic' centre, which is simply the vaso-motor centre for the liver; (4) centre for swallowing; (5) centre for movements of the gullet and stomach, and the vomiting centre; (6) for movements of articulate speech; (7) for the secretion of the saliva. The term 'centre' involves the following mechanism: (1) A sensitive end-organ or surface; (2) an afferent nerve going to (3) a nerve cell, or group of nerve cells, from which passes (4) an efferent nerve fibre to (5) a muscle. That the action of the 'centre' be possible all the links in the chain must be intact.

DISEASES OF THE BRAIN.—Abscess.—Abscess of the brain is a collection of pus in its substance. The most common causes are compound fractures of the skull, diseases of the middle ear and temporal bone, and pyæmia. Many cases develop quietly, others are preceded by headache, pain, vomiting, delirium. When pus has formed, the symptoms will depend on the site; usually there is more or less paralysis of motion. Finally the signs of compression precede the fatal termination. When an abscess in the brain has formed, if its situation can be made out, the pus should be evacuated by Trephining (q.v.). Many cases have recently been treated successfully in this way.

Anæmia of the brain is a deficiency in the quality or in the quantity of blood in the brain. It may result from direct loss of blood, exhausting diseases, weakness of the heart, or from the pressure of growths or fluids within the skull. Headache, drowsiness, hyperæsthesia, giddiness, muscular weakness are generally present, and most marked in the erect position. Syncope, or fainting, may result from the too rapid assumption of the erect position. In anæmia from acute loss of blood, and in syncope, the head must be kept low, and stimulants applied to the skin, and, if possible, administered internally. In chronic anæmia, the cause must be removed, stimulating nourishment given at frequent intervals, and iron administered.

Atrophy of the brain is a wasting of its substance, and is either congenital, or a condition accompanying old age, or resulting from exhausting disease, and very frequently from alcoholic excesses. The congenital form produces imbecility or idiocy. The acquired form leads to loss of memory and of mental power, and generally to diminution of muscular power.

Compression, concussion, and contusion of the brain are three terms often popularly confounded with each other. Compression means the squeezing of the brain by any fluid such as blood, serum, or inflammatory exudation or tumour. Concussion is the result of shock to the brain from an injury, but without visible effect on its substance. In contusion the brain substance is more or less lacerated. In compression there is paralysis, insensibility, coma gradually deepening, dilated pupils, and

generally a slow pulse. In concussion there is first a period of collapse, with pallor of face, feebleness of pulse, and cold extremities. If this is recovered from, consciousness gradually returns with vomiting, fever, and a more or less sleepy condition. Perfect quiet, and the avoidance of all stimulation, must be observed till convalescence is complete.

Congestion of the brain causes headache, giddiness, mental excitement, and sleeplessness. If long continued, a period of depression follows with drowsiness, mental and physical weakness. Some attacks are so acute as to produce delirium, or convulsions, or even symptoms of apoplexy, which may be fatal. Among the causes of acute congestion may be noted excessive mental strain, the use of alcohol in excess, and some of the acute fevers. It is of frequent occurrence in certain diseases of the nervous system.

Inflammation of the brain substance is usually the result of injury or disease of the bones of the skull, and is accompanied with more or less meningitis.

Hemorrhage into the brain leads to Apoplexy (q.v.). It is probably always preceded by disease of the blood-vessels, more especially with chronic Bright's disease and alcoholism. The vessels which rupture are most commonly the small arteries which pass through the basal ganglia. The onset may be quite sudden, or there may be premonitory symptoms such as headache, giddiness, or numbness in the limbs, &c.

Meningitis, Hydrocephalus (or water in the head), *Epilepsy, Aphasia*, are all forms of brain disease, but are treated as separate articles.

Brain Fever is a popular term which includes congestion of the brain and its membranes, delirium tremens, and inflammation of the brain substance itself. It ought to be discontinued altogether.

Softening is a term popularly and very erroneously used to indicate failure of mental power and general feebleness, often accompanied with drowsiness, dullness, loss of memory, and with emotional excitability. There may be no actual softening in such a condition—merely atrophy of the brain.

True softening is the result either of clotting of blood in the vessels, disease of the walls of the arteries (atheroma), or Embolism (q.v.), or the presence of tumours. The brain substance becomes red, or yellow, or white, and the fibres break up as oil drops, and are gradually absorbed, a cyst containing fluid being left. The symptoms will depend on the part affected; if in the motor area, there will be paralysis of motion; or in the sensory area, loss of the corresponding power of conscious perception.

Tumours may grow from the membranes, the blood-vessels, or the connective tissue of the brain. They vary greatly in structure, many being allied to the sarcomata. The symptoms vary greatly according to their position, or may be absent entirely. The most common symptoms are intolerable headache, vomiting (without sickness), giddiness, convulsions, paralysis, and a condition of the optic nerve and retina recognisable by the ophthalmoscope, called optic neuritis. Some tumours can be removed by medical treatment, a few by surgical means. Generally all that can be done is to relieve pain and support the strength.

Brain-coral. See MÆANDRINA.

Brainerd, a city of Minnesota, on the Mississippi, has foundries, railway works, and miscellaneous manufactures; pop. 10,000.

Brainerd, DAVID (1718-47), missionary from 1742 to the American Indians, was born at Hadam, Conn., studied three years in Yale College, and died at Northampton, Mass., in the house of Jonathan Edwards. See Life by latter (1749).

Braintree, a town of Massachusetts, 10 miles S. of Boston, manufactures shoes, &c.; pop. 10,000.

Brakelonde. See JOCELIN.

Braikes. Any contrivance for controlling by friction the speed of carriages, wagons, trains, or revolving drums is called a brake. In its simplest form, as applied to horse-drawn road vehicles, wooden blocks are pressed by the driver through the medium of connecting rods or levers against the tires of the wheels; the friction thus set up checks the speed, enabling the vehicle to go down inclines at a steady speed or to be rapidly pulled up; in the case of cranes and similar machines a flexible strap or band is tightened on a rotating pulley or drum.

Braikes find their most important application on railway trains. Stephenson devised a steam-operated brake for his locomotives, but it was not a success. Since his day much work has been done by engineers in designing various types of power brakes for railway work, mainly with the object of making them continuous and automatic. Briefly the conditions which a train brake should fulfil are these: It must be continuous—that is, connected throughout the train; automatic—that is, in case of accident, such as the breaking apart of the train, it must instantaneously put itself on; be equally readily put on or off any vehicle, and be simple in construction and durable. Moreover, it should allow of vehicles being slipped or detached without putting it on, should be tell-tale to indicate if it is in working order, be constantly in use, and, lastly, very powerful, capable of stopping a heavy train at a high speed in a few hundred yards.

The two chief types of continuous automatic train brakes now in use are the Westinghouse and the Vacuum. The first pressure brake, patented in 1869 by Mr Westinghouse of Pittsburg, U.S.A., was of the non-automatic type, but it did not prove a success, chiefly owing to the fact that it was not operative on detached coaches when a train broke apart, and also owing to the time before the brake-blocks came into operation on the rear coaches of long trains; it was therefore superseded later by the ordinary automatic pressure air brake. In this brake compressed air at from 70 to 80 lb. per square inch is stored in a reservoir under each vehicle and in a pipe connecting them; also under each vehicle is a brake-cylinder the piston of which through rods operates the brake-levers; and, lastly, a complex connecting valve known as the 'triple valve.' As long as pressure is maintained in the train-pipe the brake is off, but if the air escapes intentionally or otherwise from the train-pipe the brakes are put on. The triple valve is an ingenious piece of mechanism. A piston with a sliding valve attached to its top works in a small case with connections to the train-pipe, brake-cylinder, and air-reservoir. If there is air pressure in the train-pipe it acts on the under side of the small piston, keeping it and its valve in such a position that the brake-cylinder is in communication with the air (the brakes are therefore off), while compressed air can feed freely into the reservoir; but if the pressure in the pipe falls, the excess pressure in the reservoir acts on the top of the piston, forces it and its valve down, thus shutting the passage to the air and allowing compressed air to rush from the reservoir into the brake-cylinder, which causes its piston to

move and put the brakes on. An auxiliary valve in the slide valve gives perfect control over the pressure, and provision is made against accidental leaks of compressed air into the brake-cylinder by means of grooves opening to the air, which are shut when the brakes are put into action.

The brake-cylinder may have two pistons (see diagram), kept close together by powerful springs; the compressed air enters between them and forces them apart, thus operating the brake levers. The hose couplings for the pipes between the carriages are automatic; a valve opens in them when the couplings are made and closes if they are disconnected, except when forcibly torn apart by an accident. To reduce the time for the reduction of air pressure in the train-pipe to reach the rear of the train, in the quick-acting type of brake the triple valve is fitted with a supplementary device which permits, when the air pressure is suddenly lowered, air from the train-pipe to pass directly into the brake-cylinder. This increases both the effective pressure in the brake-cylinders and also the rapidity with which the whole system of brakes comes into action. In 1906 a further change in the mechanism was made in order to produce the quick-action not only for emergency stops, but for ordinary service conditions. The supplementary device explained in the last paragraph was superseded by a small chamber normally full of atmospheric air, which is put into communication with the train-pipe instantly the triple valve begins to operate. Hence, as soon as the driver lowers the pressure in the train-pipe and the triple valve of the first carriage begins to move, the rush of air into its small chamber produces a local further reduction of pressure in the train-pipe which at once reacts on the triple valve of the next vehicle, and so on all along the train, with the result that the brakes on the last vehicle of a train of 1800 feet length are put into action within $2\frac{1}{2}$ seconds after the driver operates his valve.

Automatic vacuum brakes work on the principle of keeping up a vacuum of about 10 lb. below atmospheric pressure in the train-pipe and brake-cylinder under each vehicle, the air being sucked out by ejectors or pumps on the locomotive. The communication between train-pipe and brake-cylinder is controlled by a ball-valve. When the brakes are off there is a vacuum on each side of the piston of the brake-cylinder; when the vacuum is destroyed by the driver or guard letting air into the train-pipe the vacuum on one side of the piston is destroyed, and the piston moves, putting on the brakes through a system of levers; a similar state of affairs is brought about if the train-pipe is forcibly ruptured by any accident. There are various special devices, similar to those in the Westinghouse brake, for bringing all the brakes on the train into action as nearly simultaneously as possible.

A valuable set of experiments was made by Sir Douglas Galton on the Brighton and South Coast Railway in 1878 (see *Proc. Inst. Mech. Eng.* 1878, 1879), which proved, amongst other things, that the pressure between wheel-tires and brake-blocks should not be so great as to cause the wheels to skid, and that the coefficient of friction between shoe and tire increased as the speed of the train was decreased. Another valuable series of experiments was that made by the American Motor-car Builders Association in Iowa in 1886-87.

The word brake is also used to indicate any form of engine dynamometer which measures the power

given out by any engine or electric motor by absorbing it in overcoming friction; the simplest method is to hang weights from a strap or rope encircling a pulley or the flywheel of the engine, the other end being attached to a spring balance fastened

Diagram of Westinghouse Automatic Brake, showing arrangement for one carriage :

to the engine base. When the weights so hung are kept in a 'floating' position, the difference between the weights and the pull in the spring-balance measures the horse-power of the engine.

Brama, or RAY'S BREAM (*Brama raia*), a bony fish closely related to the Coryphænas or 'dolphins,' and therefore belonging or nearly allied to the mackerel family. In this genus the body is laterally compressed and more or less deep, the spinous portion of the long dorsal fin is not well developed, and the tail is deeply forked. Ray's bream is found from the Cape seas northward to the Mediterranean, and even to British coasts. Its total length may be as much as 2 feet. The flesh is said to be very good.

Bramah, JOSEPH, inventor, was born at Stainbrough, near Barnsley, Yorkshire, April 13, 1748. A farmer's son, he was incapacitated in his sixteenth year for agricultural labours by an accidental lameness, so was apprenticed to the village carpenter, and afterwards obtained employment with a London cabinetmaker. Subsequently, he established himself in business in the metropolis, and became distinguished for the number, value, and ingenuity of his mechanical inventions, such as safety-locks, and improvements in water-closets (his first patent, 1778), which have continued in use till the present time; in pumps and fire-engines, in the construction of boilers for steam-engines, in the processes of making paper, in the construction of main-pipes, wheel-carriages, the beer-machine used at the bar of public-houses, and many others. In the year 1796 he patented the hydrostatic press known by his name, which ranks as his most important contribution to mechanical science (see HYDRAULIC PRESS). He patented a very ingenious machine for printing bank-notes in 1806, and was one of the first to propose the application of the screw-propeller. In all, he took out eighteen patents. It has been remarked that the germs of all his inventions may be found in the work of others, but that he possessed the genius of improving upon and practically applying the work of previous inventors. He died 9th December 1814.

Bramante, DONATO, architect, was born near Urbino in 1444. From 1472 to 1499 he resided in Milan, where he studied geometry and perspective, neither of which sciences was well understood by artists in his day. He was noted as one of the best painters in Lombardy; but his success in architecture eclipsed his fame as a painter. After the fall of Ludovico Sforza, Bramante went to Rome,

where he was first employed by Pope Alexander VI., and afterwards by Julius II. The first great work which he undertook for the latter was to connect the Vatican palace with the two pavilions of the Belvedere by a series of immense galleries; the second was the rebuilding of St Peter's Church, of which he laid the new foundation in 1506. When only a small portion of his plans had been realised, Bramante died at Rome, 11th March 1514, and succeeding architects departed widely from the original design of a grand cupola over a Greek cross. Among other works of Bramante in Rome may be mentioned the Cancellaria and Torlonia palaces, in which he adhered more strictly than in other works to antique forms, but not without a characteristic grace in his application of these.

Brambanan, a district of the province of Surakarta, Java, rich in remains of Hindu temples, of which there are six groups, with two apparently monastic buildings. The edifices are composed entirely of hewn stone, and no mortar has been used in their construction. The largest is a cruciform temple, surrounded by five concentric squares, formed by rows of detached cells or shrines, embracing an area of 500 feet square. In several of these *dagobas* the cross-legged figures of Buddha remain; but the larger figures which must have occupied the central temples have disappeared from all but one. The outer one consists of 84 temples; the second, of 76; the third, of 64; the fourth, of 44; and the inner one, of 28. In the centre stands the largest and most imposing structure of all. It is 90 feet high, and profusely decorated with mythological figures, which are executed in a very fair style of art. On the south face of the outside parallelogram there are two monstrous figures, with uplifted clubs, kneeling in a threatening attitude. One of the single Buddhist edifices is pretty entire, as are also about a third of the cells, but the rest lie strewn upon the ground.

Bramble, or **BLACKBERRY** (*Rubus fruticosus*), a plant common in Britain and most parts of Europe, having prickly suems, which somewhat resemble those of the Raspberry (q.v.). The flowers do not appear till the summer is considerably advanced, and the fruit ripens towards the

Branch of Common Bramble:
a, a flower; b, fruit.

end of it, continuing to be produced till the frosts of winter set in. The fruit is too well known to need description. Preserves are prepared from it of very delicate flavour, besides a pleasant and fairly potent wine. The bramble is little cultivated in Britain; but it seems to deserve attention at least as much as the raspberry, and shows great capacity for improvement by cultivation. A slight rail on each side of a row of brambles, to restrain

the straggling stems, affords the necessary security for neatness and order, and the care bestowed is repaid by abundance of fruit, very acceptable where wild brambles are not plentiful, and at a season when there is no other small fruit in the garden. This being one of the most variable of British plants, its systematic arrangement is a matter of great difficulty. New forms seem to spring up by mutation and crossing. Some are very pretty, and reward cultivation on the rock-garden. In America they are extensively cultivated for their fruit; and of late American kinds have been with advantage introduced into Britain. In Scotland the name 'biamble' is applied to the fruit as well as the shrub, and 'blackberry' is by some used for 'black-currant.'—Species of *Rubus* very similar to the common bramble, or varieties of it, abound in the northern parts of Asia, the Himalaya Mountains, and North America. See *RUBUS*.

Brambling, **BRAMBLE FINCH**, or **MOUNTAIN FINCH** (*Fringilla montifringilla*), one of the Finches (q.v.), very like the chaffinch, but slightly larger, and with a more forked tail. In the males, the crown of the head, the cheeks, the back and sides of the neck, and the upper part of the back, are mottled in winter with brown and black; but in spring all these parts have a rich velvety black. The throat and breast are of a rich fawn colour, which is also the prevailing colour of the wings. These are crossed, however, when closed, by an oblique band of jet-black, and by another oblique band of white. The quill-feathers are also black, edged with yellow on their outer webs; the tail-feathers black, edged with reddish white; the rump and the belly are white; a small tuft of feathers under each wing and some of the lower wing-coverts are bright yellow. The female has a reddish-gray head. So far as is known, this finch has no song, but only a monotonous chirp. It is a mere winter visitant in Britain, and even in the south of Sweden it is only a winter bird. It breeds in the more northerly parts of Europe and Asia, and is very widely distributed.

Bramhall, **JOHN**, a great anti-Puritan Irish prelate, was born in 1594, and educated at Sidney-Sussex College, Cambridge. He was already sub-dean of Ripon, and on the road to high preferment when he went to Ireland as Wentworth's chaplain in 1633. He soon became Archdeacon of Meath, and was consecrated Bishop of Derry in 1634. Bramhall's intolerance roused the wrath of the stubborn Scottish settlers in his diocese, and ruined the king's cause in Ulster. When the Civil War broke out, for safety's sake he crossed to England, but the royalist disasters soon drove him to the Continent. At Paris, he argued with Hobbes on necessity and the freedom of the will, but the dogmatic bishop was no match save in his own opinion for that subtlet of sceptics. The Restoration gave him the metropolitan see of Armagh, which he filled till his death in 1663. Bramhall closely imitated Laud in policy, and even resembled him in person, but was far his inferior in intellect. Not strong but merely obstinate in purpose, the so-called Athanasius of Ireland by his impolitic intolerance sealed the doom of Episcopalian supremacy in Ulster. His collected writings have slumbered since their publication in 1677.

Brampton, a very ancient town of Cumberland, 9 miles E.N.E. of Carlisle by rail. It has a moot-hall, boarding schools, and breweries; there are coal-mines near. Two miles east stands the abbey of Lanercost (q.v.). There is another Brampton close to Chesterfield (q.v.), and several hamlets bear the same name.

Bran is the material obtained from the outer covering or husk of grain during the process of

grinding, and which is separated from the finer flour before the latter is made into Bread (q.v.). It is generally met with in commerce in thin scaly yellowish-brown particles, with sharp edges, and its composition in 100 parts is as follows: Water, 14; fibrin, &c., 15; starch, 44; fat, 4; lignose and cellulose, 17; ash, 6. Bran contains a nitrogenous body called *cerealin*, which is capable of producing, by a process of fermentation, a chemical change in the starch, dextrin, &c. of flour. Bread made of flour containing bran is known as *Blown Bread* (see *BREAD*). The main uses to which bran is put are in the feeding of horses and cattle, and poultry, and in clearing and brightening goods during the processes of Dyeing and Calico-printing (q.v.). In the practice of medicine, bran is employed as a warm poultice in abdominal inflammation, spasms, &c., and an infusion is used as an emollient foot bath. It is also used internally in catarrhal affections.

Branch, Branching. In the widest sense we may speak of branching whenever one part gives rise to another similar one, be it the thallus of the lowest plants, or the root or stem of higher ones; more strictly, however, the term is restrained to the ramification of stems. Branches then 'are secondary stems developed from a primary one, or tertiary from these, and so on.' The growing point in many cryptogams folks constantly, while in the higher plants we have a potential branch in every vegetative bud except the terminal one which continues the main axis (see *BUD*). The number and position of the branches is thus in the first place determined by those of the leaves, but in the vast majority of cases such exuberant ramification is impossible, and many or most of such buds perish early or never even develop. This arrest depends largely on individual circumstances, and the branches may thus come to have a quite irregular or at anyrate undefinable position; yet this is by no means always the case, even in our trees. The general aspect of trees depends more upon their mode of branching than the form or exuberance of their foliage; notably that broadest of all arboreal contrasts, between the spire-like growth of the coniferous trees and the more spreading deciduous ones. In the conifers the lateral branches often perish and are thrown off from below upwards, and the adult stem thus appears branchless to a great height; yet even here sooner or later a branchy head is formed, as in the familiar Scots pine or the Italian pine. The predominance of the main axis over the branches may long persist in many deciduous trees, and especially in their fastigate varieties, like the Lombardy poplar; frequently, however, as in the elm, the main axis soon becomes altogether lost, or apparently continued by several main branches. The angle at which branches come off also largely varies; usually ascending and acute, they may be at a right angle—e.g. cedar—or even droop, as in 'weeping' trees. With regard to the conifers, it may be noticed that the shortened branchlet of the larch, with its tuft of needle-like leaves, is represented in the pines by a still more reduced form, which has only two leaves, surrounded at the base by a number of bud scales. When the vegetative life of these ceases, the branchlet is disarticulated as a whole—a fact the more curious in relation to the separation of the large lower branches of the stem, which also snap off, leaving a clean cicatrix. That more or less distinct tendency to the development of the lateral buds, and the consequent subordination of the apical one, which all branching implies, may be traced from the general aspect of the tree into the details of its growth, and yet more fully into its inflorescence. Thus, while in the simplest case, the secondary axes are all subordinate to the primary one, as in

a pine-tree or a raceme, the growth of the branches tends continuously to predominate. The shorter, more rounded, and long-branched conifers and other trees, or the 'corymb' variety of the raceme, are the simplest cases of this; but more definite forms also arise. Thus, when the leaves are opposite, the large development of the lateral branches to an equality with the main stem may give a three-branched appearance, which is well exhibited by valerian (fig. 2). More frequently,

Fig. 1.—Mode of Branching in alternate-leaved plants; with series of modifications brought about by increasing subordination of the main axes and development of the secondary ones.

a, unmodified form, or racemose type; b, secondary axes lengthened (corymbose type); c, the secondary axes (arising in axils of leaves) nearly as well developed as main axis (Umbellifers); d, primary axis quite arrested after giving off its first axillary bud; this develops as a secondary axis, its bud as a tertiary, and so on, the stem being thus a composite or 'false' axis, or sympodium.

however, the development of the lateral branches exceeds that of the apical one altogether, which may be reduced to flower-bearing or totally arrested, and *false dichotomy* is the result; the autumnal arrest of the apical bud of the lilac, with development of its two lateral ones in spring, the apparent forking of the mistletoe, and the 'dichotomous cyme' of the pinks or chickweeds, are all familiar instances of this. Where the leaves are alternate we may also have an apparent forking, due to the equal development of the axillary branch, as often happens in Umbelliferae; or the main axis may be reduced to terminate in a flower, as in the scorpioid and helicoid cyme, or may be checked altogether, as in the shoot of the lime.

Fig. 2.—Similar modification of Branching in opposite-leaved plants:

e, primitive form; f, equal development of lateral branches (Valerian); g, arrest of main axis with development of secondary axes alone, and consequent resemblance to dichotomy (Mistletoe).

Where, as in most of these cases, the primary axis is not only checked by its secondary axis, but this bears a bud or tertiary axis, which again overpowers it, and so on, a *false axis* or *sympode* is formed. Physiologically indistinguishable from an ordinary main axis, examination shows that the leaves are not borne in the ordinary way, but have

developed the successive segments of stem in their respective axils.

The underground branches of a rhizome are often thickened as *tubers*; or they may send up tertiary branches to become new ascending axes—the *suckers* of the raspberry or rose. A *stolon* is a prostrate branch which roots at the tips and then develops an ascending branch; it may often be long and thread-like, and is then called a *runner* (strawberry). Branches may also undergo modifications from vegetative forms to new purposes—they may become sensitive and supporting as tendrils, their vegetative life may be diminished and their growing points hardened off as spines or thorns; the flower too is of course a reproductively shortened axis with modified appendages. See INFLORESCENCE.

Branchiæ. See GILLS.

Branchiopoda, a sub-order of Crustaceans in the order with leaf-like feet (Phyllopoda). The name (gill-footed) refers to the fact that many of the numerous (10–40 pairs) appendages bear respiratory appendages. The body is distinctly jointed; the shell may be absent, shield-shaped, or bivalved; there are well-developed steering antennæ; the eggs are borne on several of the legs, or, in Branchipus and Artemia, in a special brood-sac. The heart is unusually elongated. They are mostly comparatively small, though not microscopic. The males often appear to be absent through a series of generations. The young mostly begin at the Nauplius stage, and pass through striking metamorphoses. None of the Branchiopoda are marine; a few live in salt lakes and brine-pools, the rest in fresh water. Only a few (*Apus*, *Estheria*) are known as fossils. See CRUSTACEA, BRINE-SHRIMP.

Branchios'tomum. See AMPHIOXUS.

Branceo, RIO, a river of northern Brazil, rises in the Parima Mountains, on the very borders of Venezuela; and after a southerly course of about 400 miles, it joins the Rio Negro, of which it is the principal tributary, on its way to the Amazon.

Brancursine, a French popular name introduced by old writers for *Acanthus mollis* (see ACANTHUS); also applied to the Cow-parsnip (*Heraclium Sphondylium*).

Brand is the mark left upon the skins of cattle, often for the purpose of recognition by the owner, as in cattle-ranches in America, produced by searing with a hot iron; or a mark made in the same way on a cask or box for trade or excise purposes—hence the expression 'a good brand' of cigars, or the like (see FISHERIES and TRADE MARKS). The Branding of criminals is a separate article. The name Brand is given to the fungoid diseases or blights of grain crops—Bunt (q.v.), Mildew, Rust, and Smut (q.v.)—and refers to the burnt appearance which characterises the diseases to which it is applied. See PLANTS (DISEASES OF).

Brand, SIR JAN HENDRIK (1823–88), born at Cape Town, the son of Speaker Sir Christoffel Brand, was educated there and at Leyden, and became professor of Law in the South African College. As President of the Orange Free State (1864–88) he was regenerator of the country. He defeated the Basutos (1865–69). Though unsuccessful in the diamond-fields dispute, he did much to preserve friendly relations with Britain, and was instrumental in making peace between Britain and the Transvaal.

Brand, JOHN, antiquary, born in Durham county, 19th August 1744, was apprenticed to a cordwainer in Newcastle, and educated at the grammar-school there. His industry raised up for him patrons, who sent him to Oxford, where he gradu-

ated B.A. in 1775. He had been ordained some years previously, and in 1784 he was presented to a rectory in the city of London; in the same year he was elected resident secretary of the Society of Antiquaries, to which office he was re-elected annually until his death, 11th September 1806. His *Observations on Popular Antiquities*, first published in 1777, and edited with additions by Sir Henry Ellis (3 vols. 1813), was corrected, extended, and rearranged alphabetically as *Faiths and Folklore of the World* by W. C. Hazlitt in 1905.

Brandane. See BRENDAN.

Brande, WILLIAM THOMAS (1788–1866), chemist, born in London, studied chemistry at St George's Hospital, commenced lecturing on chemistry and physics in 1808, and was elected F.R.S. in 1809. He was professor of Chemistry to the Apothecaries' Company and at the Royal Institution, and head of the coinage department of the Mint. He published a *Manual of Chemistry* (1819), a *Dictionary of Materia Medica* (1839), and a *Dictionary of Science and Art* (1842).

Brandenburg, a province of Prussia, formed its nucleus, though it does not quite correspond with the old *Mark* of Brandenburg, which included parts of the province of Saxony and of Pomerania. Almost the whole province is a plain, so low that at Potsdam the surface of the river Havel is only about 15 English feet above the level of the sea. The ground becomes slightly hilly towards Silesia. In general, the soil is sandy and naturally unfruitful. Without its numerous rivers and canals, Brandenburg would be one of the most barren tracts on the Continent. The inhabitants are mostly Germans, mixed with French and Dutch colonists, who, however, are almost completely Germanised; and in the south of the province, with people of Wend extraction. Shipping, agriculture, and the rearing of cattle afford occupation for a considerable number. The chief manufactures are cotton, wool, linen, sugar, glass, tiles, and machinery. There are also numerous distilleries. The province is divided into the governments of Potsdam and Frankfurt—Berlin forming a separate jurisdiction. Area, 15,000 square miles; population (exclusive of Berlin) in 1880, 2,266,651; in 1910, 4,092,616, of whom all but about 300,000 Roman Catholics, 61,000 Jews, and 54,000 others were Protestant; (1919) 2,445,627. In the beginning of the Christian era, Brandenburg was inhabited by the Semnones, and afterwards by Slavonic tribes. In 927 Henry I. defeated the latter at the Elbe, and plundered their capital of Brennbir, afterwards raising the district into a *Mark* (see MARCHES). Albert the Bear became the first Markgraf in 1134, and Frederick of Nürnberg the first Elector in 1415. The Mark or Electorate became united with the duchy of Prussia in 1618, which, under the Great Elector, Frederick-William I., shook off the suzerainty of Poland in 1657, to become, under the Great Elector's son Frederick, in 1701, the kingdom of Prussia. See PRUSSIA.

Brandenburg, the ancient *Brennbir* or the Wends, 38 miles WSW. of Berlin. The Old Town and the New are on either side of the Havel; on an island in the river stand the castle and the cathedral (14th century), with a fine crypt. The manufactures include woollens, silks, hats, baskets, leather, and starch. Pop. 53,000.

Brandenburg, NEU. See NEUBRANDENBURG.

Brandes, GEORGE, a Danish literary critic of Jewish family, born 4th February 1842, in Copenhagen, where he graduated at the university in 1864. Several books on æsthetic and philosophic subjects brought on him a charge of scepticism, which was not removed by an epoch-making series

of lectures, delivered before large audiences, and published as *Main Currents in Nineteenth Century Literature* (1872-75; trans. 6 vols. 1901-5); for his description of the later intellectual position of Europe, as broken away from the orthodoxy and romanticism of the beginning of the century, brought on him the bitter attacks of all the reactionary forces in Denmark. His *Danske Digtere*, a masterpiece of psychological analysis, appeared in 1877; but the hostility of his enemies induced him in the same year to leave Denmark and settle in Berlin, where he published, among other works, critical biographies of Lassalle (1877), Esaias Tegnér (1878), and Lord Beaconsfield (1879). A lecture tour through Norway and Denmark brought a powerful party to his side, and in 1883 he returned to Copenhagen. Later works include *Den Romantiske Skole i Frankrig* (1882); a *Life of Holberg* (1885); three books on Ibsen (1867, 1882, and 1898), translated into English and published together; *Shakespeare: a Critical Study*; *Goethe*; and an Autobiography.

Branding has been practised from very early times. The Greeks marked their slaves with the *stigma*; in Rome, runaway slaves (*fugitivi*) and thieves (*fures*) were branded with the letter F; and the slaves who worked in the mines, and convicts condemned to the games or to the mines, were also branded on the forehead for identification. Constantine limited branding to the hand, arm, or calf; the face had been fashioned in the image of God, and was to be protected from such degradation. The Canon Law provided for this punishment, and in France, down to 1832, galley slaves were marked T F (*travaux forcés*); but in Germany it has never been recognised by the common law. Under the ancient law of England, branding was practised for various offences by the application of a hot iron, the end of which had the form which it was desired should be left imprinted on the skin. The famous Statute of Vagabonds under Edward VI. authorised the branding of the letter V on the breast of a runaway servant; and where such a servant had been sold, and afterwards escaped, he might be branded with the letter S on cheek and forehead as a slave. In the same reign, bawling in church was punished by branding with the letter F on the cheek as a fraymaker. During the two centuries of persecution to which the Gypsies were subjected throughout Europe, this was a mild form of punishment; in 1636 some 'Egyptianis' were sentenced at Haddington, 'the men to be hangit, and the women to be drowned; and suche of the weomen as hes children to be scourgit throw the burgh and brunt in the cheekes.' In the time of Henry VII. branding had been substituted for ecclesiastical purgation in the case of all *clerigible* offences by burning on the hand (see *BENEFIT OF CLERGY*); and with a view still further to repress theft and petty larceny, it was provided in 1698 that such offenders as had the benefit of clergy allowed them should be 'burnt in the most visible part of the left cheek, nearest the nose.' This additional severity, however, had not the desired deterrent effect, and was repealed in 1707. Cold branding, or branding with cold irons, was a way of nominally inflicting the penalty. Branding was discontinued in the reign of George III., and finally done away with in 1829. Army 'branding' or 'marking' with the letter D. or B. C. (Deserter or Bad Character), by tattooing with needles and Indian ink, *not* by burning, was abolished in 1879.

Brandis, CHRISTIAN AUGUST, was born in 1790 at Hildesheim, and from 1822 till his death on 24th July 1867, was professor of Philosophy at Bonn,

except that during 1837-39 he was cabinet-counsellor to the young king of Greece. With Bekker, he edited Aristotle, and he published two works on ancient philosophy. His son Johannes (1830-73) wrote on numismatics and Assyrian archæology.

Brandl, ALOIS, born at Innsbruck in 1855, became professor of English philology at Berlin in 1895, and wrote on old English literature, the drama, Coleridge, &c.

Brandling. See SALMON.

Brandon, an important mining-town in the county of Durham, 3 miles SSW. from Durham; pop. with Byshottles (urban district), 19,000.—**BRANDON**, a quaint old market-town, mostly on the Suffolk side of the Little Ouse, 7½ miles NW. of Thetford. The *Grimes Graves* close by are Neolithic flint-workings. Gun-flints are still made, chiefly for the African market; and the continuity of the 'flint-knapping' industry, though now almost extinct, can be traced from early prehistoric periods.

Brandon, a city of growing importance in Manitoba, Canada, below the junction of the Assiniboine and Little Saskatchewan rivers, in a prolific wheat-growing district. Founded in 1881, it had in 1882 over 1500 houses. Pop. 15,000.

Brandt, SEBASTIAN, author of the *Narrenschiff*, or *Ship of Fools*, was born at Strasburg, 1458; studied law and the classics with zeal at Basel, where he received permission to teach; and soon became one of the most influential lecturers in that city. The Emperor Maximilian showed his regard for Brandt by appointing him an imperial councillor. He died at Strasburg in 1521. His *Ship of Fools*, a satire on the follies and vices of his times, which was published at Basel (1494), is not very poetical, but is full of sound sense and good moral teaching, and was so much esteemed that the German popular preacher Geiler occasionally took his texts from it. The best editions are by Zarncke (1854), and Goedeke (1872). It has appeared in almost every European language; it was translated into Latin by Locher (1497), and into English by Henry Watson, *The Grete Shippe of Fooles of the Worlde* (1509); partly translated and partly imitated by Alexander Barclay (q.v.), and imitated by W. H. Ireland in the *Modern Ship of Fools* (1807).

Brandy (Fr. *eau de vie*) is a term properly restricted to the liquid obtained by distilling the fermented juice of the grape. The fermented liquors or wines which are employed for that purpose are various, and contain a proportion of Alcohol (q.v.), which runs from 10 to 25 per cent. of their weight. The red wines generally are preferred. In the 17th century, French brandy was made only from white wine. About 1000 gallons of wine give by distillation from 100 to 150 gallons of brandy, which varies in strength, but is generally diluted with water till it contains from 50 to 54 per cent. by weight of absolute alcohol. When originally distilled, brandy is clear and colourless, and if wished to remain so, is received and kept in glass vessels; but when placed in wooden casks, the spirit dissolves out the colouring matter of the wood, and acquires a light sherry tint, which may be deepened by burnt sugar and other colouring matter, intentionally added by the dealers. The pleasant aroma of brandy is due to the presence of more or less Fusel Oil (q.v.) accompanied by Ceantholic Ether (q.v.), derived from a volatile oil in the husk of the grape. The most famous brandy is that distilled in the country round Cognac, in Charente, in the west of France, from the choicest wines, but comparatively little of that sold under the name of *Cognac* comes from this district. *Armagnac* is the brandy of another district. Since the vines of

France have suffered from oidium, phylloxera, and mildew, only a very small proportion of what is imported and sold as Cognac is made from wine, or even from cider, grape refuse, wine lees, and fruit. In the last quarter of the 19th century there was good reason to believe that too many French houses imported potato-spirit in large quantities from Germany, and reshipped it to England as French brandy; beetroot-spirit is also much used, the coarse spirit being flavoured with ænanthic ether, with Cognac oil (made from palm oil), the essential oil distilled from husks of the grape, and other flavouring matters. Much brandy is distilled in Portugal, almost exclusively from white grapes (which contain more alcohol than red ones), and a small quantity is also made from grape refuse (*marc*). To produce 1 gallon of this brandy, 5 to 7½ gallons of wine are required. This brandy contains 75 per cent. of absolute alcohol (33 over proof of Sykes), and is principally used in checking fermentation in wine-making, and in preserving the sweetness of Portuguese wine. Brandy is also exported by Spain, Australia, Algiers, Greece, and Egypt. Some of the brandy sold in Great Britain and Ireland is prepared at home from ordinary grain-alcohol, by adding thereto Argol (q.v.), bruised French plums, some French wine-vinegar, a little good Cognac, and redistilling. The Germans use the name *Brantwein* for all kinds of grain-spirit, or that distilled from plums, blue-berries, &c. *Kirschwasser* or *kirschbrantwein* is distilled from cherries and their kernels. In England *cherry-brandy* is brandy in which cherries have been steeped and preserved. In the United States brandy was also made from cherries, apples, pears, and peaches; and the States exported much common whisky to France, which was re-imported as brandy. In 1909 a royal commission expressed the opinion that, although in old statutes the term brandy was a perfectly general expression for potable spirit, it was now by association in the minds of consumers, and by the custom of the trade, restricted to spirits derived from the grape. It sanctioned, however, the use of the name British brandy for the compounded spirit so called. Brandy is frequently administered as a stimulant, and in cases of suspended animation, exhaustion, and in mild diarrhoea. It may be used externally for checking hemorrhage, and for hardening tender skin. See ALCOHOL (USES OF), DISTILLATION, WINE.

Brandywine Creek, a stream rising in Chester county, Pennsylvania, flowing with a general south-easterly course into Delaware, and emptying into Christiana Creek at the city of Wilmington. A battle was fought on its banks, 11th September 1777, in which 13,000 Americans, under Washington, were defeated by a force of 18,000 British, under Lord Howe.

Brangwyn, FRANK, R.A., was born at Bruges, of Welsh extraction, in 1867, and worked with William Morris in decoration. Afterwards he travelled in the East, and developed as a colorist. Besides painting, he has practised etching and other methods of art. See two books by Shaw-Sparrow (1910, 1918).

Branks, rarely BRANK, the Scottish name for a bridle or halter, but specifically for what in England is called 'the scold's bridle.' It is said to be of Scottish origin. According to Mr Llewellynn Jewitt it was never a *legalised* instrument of punishment, although corporations and lords of the manor in England, and town-councils, kirk-sessions, and barony courts in Scotland, exercised the right of inflicting such punishment. Men were put in the stocks or pillory, women in the branks, for such petty misdemeanours as are now described as breaches

of the peace, using abusive, insulting, or threatening language, cursing and swearing, and contumacy. The brank in its simplest form is a hoop of iron, opening by hinges at the sides, so as to inclose the head, and fastened by a staple with a padlock at the back; a plate within the front of the hoop projecting inwards, so as to fit into the mouth of the culprit, and by pressing upon the tongue, be an effectual gag. In some instances this mouth-plate was armed with a knife or point which cut the tongue if moved. In its last most complicated shape, the brank, by the multiplication of its hoops and bands, took the form of a conical cage or lantern, the front taking the shape of a rude mask, with holes for mouth, nose, and eyes; in one instance, the mask quite covers the face. With this cage upon her head the unfortunate woman was paraded through the streets by the bellman, beadle, or constable, or was chained to the market cross, a target for ridicule and insult. When the brank first came into use is unknown. It is found at Edinburgh in 1567, at Glasgow in 1574 and 1596, at Stirling in 1600, at Macclesfield in Cheshire in 1623, at Newcastle-on-Tyne in 1655, Worcester in 1658, Congleton in 1662, at Chesterfield, the only instance in Derbyshire, in 1688. Cheshire had thirteen examples extant in 1660. An old description of the Isle of Man mentions the tongue of a scandalous person being tied with a noose of leather called a bridle. One brank in the church of Walton-on-Thames, in Surrey, has the date of 1633. In another, called 'the witches' bridle of Forfar,' dated 1661, the gag for the mouth is not a flat plate, but a long piece of iron with three sharp spikes. A brank at Stockport was somewhat of the same description. Of examples in private custody in England, one had the date of 1688, the other the crowned cipher of King William III., and another had a mask with apertures for the eyes, a prominence to fit the nose, and a long funnel-shaped peak projecting from the mouth. The brank was used at Langholm, in Dumfriesshire, in 1772; at Morpeth in 1741; it was used at a later date at Manchester and at Macclesfield; and at Bolton-le-Moors, in Lancashire, the iron bridle was in use up to 1856 for the correction of immorality. Examples of the brank may be seen in the Ashmolean Museum at Oxford, in the National Museum of the Antiquaries of Scotland at Edinburgh, at Abbotsford, in the county-hall at Forfar, in the Guildhall at Lichfield, at Leicester, Newcastle-on-Tyne, Shrewsbury, in the town-hall at Macclesfield, in the parish church of Walton in Surrey, and in St Mary's Church at St Andrews in Fife; Chester has four examples. Brank was at one time a common name in Scotland for any sort of bridle, and the word is so used by Burns. The word is derived from the Gaelic *brangus*, an instrument for punishing petty offences, *brang*, a halter, words cognate with the Dutch *pranger*, pincers, and the German *pranger*, a pillory. See the paper by Llewellynn Jewitt, F.S.A., 'Scolds; and How they Cured them in the "Good Old Times,"' in *Reliquary*, vol. i. (1860-61); also notes in vol. xiii. (1872-73); and Andrews, *Punishments in the Olden Times*. See JOUGS.—The affection called *Mumps* (q.v.), causing a swelling about the jaws or neck, is in Scotland vulgarly known as the *branks*.

Branks.

Brant, JOSEPH (1742-1807), chief of the Mohawk Indians, fought on the side of the British in the Indian and Revolutionary wars. He translated the Gospel of St Mark and the English Prayer-book into Mohawk, and in 1786 visited England to raise funds for the erection of the first Episcopal church in Upper Canada. He was a brave warrior, a sagacious leader, loyal to his friends, and merciful to his captives. A monument, with a colossal bronze statue, was unveiled at Brantford in 1886.

Brant, SEBASTIAN. See BRANDT.

Brantford, a city and port of entry of Brant county, Ontario, 24 miles SW. of Hamilton, on the Grand River, which is navigable to within 2½ miles of the town, from which point a canal affords a waterway to Lake Erie. There are manufactures of electrical appliances, &c. Pop. 30,000.

Branting, HJALMAR (1860-1925), born at Stockholm, educated there and at Uppsala, abandoned astronomy for politics and journalism, and was the founder and leader of the Social Democrat Party in Sweden. He was thrice prime minister.

Brantôme, PIERRE DE BOURDEILLES, SEIGNEUR DE, one of the most notable of French memoir-writers, was born about 1540 in the province of Périgord. The exact date and place of his birth are unknown. He was the third son of François, Comte de Bourdeilles, and was educated at Paris and at Poitiers. In his sixteenth year the abbacy of Brantôme was bestowed on him by Henry II., but he never took orders, and spent most of his life as a courtier and free-lance. In 1561 he accompanied Mary Stuart on her journey from France to Holyrood, and in 1565 he joined the expedition sent to Malta to assist the Knights of St John against the sultan. He served in Italy under the Maréchal de Brissac, in Africa under the Spaniards, and in Hungary as a volunteer against the Turks. He was made chamberlain to Charles IX. and Henry III., and took part against the Huguenots in the religious wars of his time. About 1594 he began to write his memoirs, and thenceforth lived in retirement until his death on the 15th of July 1614. His works were not published until 1659. They comprise *Vies des Grands Capitaines Etrangers et Français*, *Vies des Dames Galantes*, and *Vies des Dames Illustres*. Their literary merit and historical interest are very considerable. Their matter is often of the most scandalous description, but they give a wonderfully vivid and faithful picture of their author's times. Brantôme depicts the corrupt court society with the most complacent frankness; he writes as if he were immortalised rather than demoralised. He had a keen eye for character; the men and women who appear in his crowded, brightly-coloured pictures have each a lifelike, sharply-marked individuality. His style is easy, lively, and picturesque. There are editions of Brantôme by Lacour and Mérimée (13 vols. 1859-94), and by Lalanne (12 vols. 1865-96).

Brash. See INDIGESTION.

Brasidas, the greatest Spartan general in the earlier years of the Peloponnesian war. Already in 431 B.C. he had distinguished himself by the courage with which he relieved the town of Methone from a hostile attack, for which he was made one of the chief-magistrates of Sparta. In 424 he relieved Megara, and he was no less successful through combined diplomacy and military skill in his expedition to Macedonia, the same year, for the purpose of seducing the cities from their allegiance to Athens. His greatest acquisition was Amphipolis. Here in 422 he had to encounter with a handful of helots and mercenaries, the flower of the Athenian army under Cleon. In

the battle both generals were killed, but the army of the Athenians was completely beaten. He was buried at Amphipolis within the walls, and for long after his death his memory was honoured as that of a hero by the celebration of yearly sacrifices and games. Thucydides speaks of the eloquence of Brasidas, so unusual in a Spartan, as well as his justice, liberality, and wisdom; while Plato compares him to Achilles.

Braşov, Rumanian name of Kronstadt (q.v.)

Brass. See BRASS ESTUARY.

Brass. In ancient history frequent allusions are made to the employment of brass in the construction of musical instruments, vessels, implement, ornaments, and even gates; but as no mention is made of its mode of manufacture, or even of its composition, it is doubtful if the brass of the ancients, with the exception of some made by the Romans, was composed of copper and zinc. Analysis of some of their coins shows that the ancient Romans were well acquainted with the art of preparing brass, in the sense of an alloy of copper and zinc. Zinc does not appear to have been known as a separate metal in Europe till the 16th century; but zinc ore was employed by the Romans along with copper to prepare brass. However, it was bronze, and to some extent iron, not ordinary brass, that was all but universally used by them for metal objects other than those made of gold and silver. See BRONZE AGE.

The term brass is now commonly understood to mean an alloy of copper and zinc, containing more than 50 per cent. of copper. Bronze (q.v.), on the other hand, means a similar alloy of copper and tin. But the word brass formerly meant bronze, and it has been used as a generic term, so as to include bronze as well as alloys of copper and lead. In this way, under one general name, there would be a zinc, a tin, and a lead group of alloys. For the tin group, see BRONZE.

ZINC GROUP—

Pinchbeck brass	4 of copper to 1 of zinc.
Dutch brass (Dutch metal).....	8 " 1 "
Yellow brass	2 " 1 "
Pale brass	1-75 " 1 "
Ship sheathing brass (Muntz's metal)	1-50 " 1 "

LEAD GROUP—

Stopcock metal.....	4 parts of copper, 1 of lead, 1 of zinc, and ½ of tin.
"	2 parts of copper, 1 of lead, and 1 of tin.
Tap and pot metals.....	Various proportions, from ⅓ to 1 part of copper to 1 of lead.

A tough brass for engine-work can be made of copper 6½, tin 1, and zinc 1; and another kind for very heavy bearings of copper 6½, tin 1, and zinc ½. See ALLOY.

As a rule, brass is easily fusible and also very malleable and ductile. Therefore it can be readily cast into moulds, rolled into sheets, hammered or stamped into various shapes, and drawn into wire. It is likewise of a pleasing colour. Brass is harder, and so stands wear better than copper, resists atmospheric influences as well, and is cheaper than that metal. These valuable properties render it next in importance to iron and steel in the metallurgical arts. The malleability of brass, however, varies with its composition, with the temperature, and with the presence, even in minute quantities, of foreign metals. Some kinds are malleable only while cold, others only while hot, and there are varieties wanting in this property at any temperature. All kinds become brittle if heated well up to their fusing-point.

Brass is more tenacious than any of the common metals except iron, steel, and copper. But if subjected to a continuous tension for some length of time, it undergoes, in many cases at least, a molecular change, and loses its tenacity. It is therefore

not quite safe to hang pictures with heavy frames or weights of any kind on brass chains or wire. The surface of this metal, if not protected by lacquer, soon tarnishes and becomes black.

The old process of making brass by mixing small bits of copper with powdered zinc ore, and heating the mixture in pots in a furnace, is now almost obsolete. The modern way of preparing it is by mixing metallic zinc directly with copper in crucibles or in a furnace. The copper is first melted, and the zinc then added in a hot state, care being required to prevent much loss by the latter volatilising. When other metals are added they are also heated first.

The molten brass is either poured into moulds to form ingots for remelting, or more commonly into ordinary sand moulds prepared from patterns. Methods of brass-founding, long primitive, were changed by the introduction of the electric furnace. The heat of the electric arc may be used; or the metal may be melted by electric currents induced in it. Brass takes a sharp impression when cast in a mould. Plates or slabs for rolling into sheets are cast between two marble blocks thinly lined with loam, the sides and ends being made up with sand. These are reduced by 'breaking-down rollers,' and afterwards by other rollers, till they become of the required thickness. As is the case with tube and wire drawing, these sheets are annealed at intervals during the process of rolling. See ANNEALING.

Ordinary drawn brass tubes are soldered longitudinally, but the tubes for locomotive boilers are formed by drawing out a solid cylinder of brass. This was looked upon as a great feat when the process, after many trials, first succeeded in 1838.

Industries which either wholly or partially depend upon brass for raw material are numerous and varied. Birmingham is their headquarters. See METALLURGY, METAL-WORK, WIRE. For nickel brass, unhappily named nickel silver, see GERMAN SILVER.

Brasses, MONUMENTAL, large plates of brass, or of the mixed metal called *latten* or *laton*, inlaid on slabs of stone, and usually forming part of the pavement of a church. The figure of the person intended to be commemorated was generally represented either by the form of the brass itself, or by lines engraven on it. Such, however, was not always the case, an ornamented or foliated cross, with other sacred emblems, being frequently substituted for the figure. Nor was the practice of imbedding them in the pavement uniform, as we sometimes find them elevated on what were called altar-tombs. The incised lines on these brasses were occasionally filled up with *niello*, and in the case of armorial decorations and the like, the field or background was often cut out by the chisel, and filled up with some species of coarse enamel, by which means the appropriate tinctures were produced. In England, the brass was usually of the form of the figure, the polished slab forming the ground, and the ornaments, arms, inscription, &c. were also inserted each as a separate piece. On the Continent, where the metal was more abundant, the brasses were one long unbroken surface, formed of plates soldered together, on which were engraved all the objects represented, the portions of the plate not so occupied being ornamented by elaborate flower-work. Brasses are known to have been used for monumental purposes from an early period, though there are no existing traces of them in England previous to the middle of the 13th century. There is reason to think that, if not imported from France, they were at first executed by French artists, but as no example of a brass exists now in France, it is impossible to establish this. Subsequently the art took root in England,

and English brasses, like English architecture, acquired a distinctive national character. The oldest complete specimen in England is that on the monument of Sir John d'Aubernoun, at Stoke d'Abernon, in Surrey. The knight died in 1277, and it is probable that the brass was executed shortly after that date. Next in antiquity are those of Sir Roger de Trumpington, who died in 1289, and of Sir Richard de Buslingthorpe, 1290; the former at Trumpington in Cambridgeshire, the latter at Buslingthorpe in Lincolnshire. In addition to the interest which they possess from their age, these brasses are remarkable as being still unsurpassed in the beauty of the workmanship and the spirit of the design. In the following century (1325), on the brass of Sir John de Creke, at Westley Waterless, in Cambridgeshire, the artist's

Inlaid brass Monument of Eleanor Bohun, Duchess of Gloucester (about 1400).

mark is affixed by a stamp—a fact which has been regarded as a proof that his craft had attained to some importance, and that his services were pretty frequently called into requisition. But in this case, as in every other, with one exception, the name of the artist has perished. The exceptional case is that of the brass which once covered the tomb of Bishop Philip, in the church of the Jacobins at Evieux, in Normandy, where the inscription ended with the words, 'Guillaume de Plalli me fecit.' Some of the brasses executed in England in the 14th century are probably Flemish; and in the churches at Bruges some exist which appear to be by the same hand as others which are found in England. But England is the only country which now possesses a series of brasses fairly representative of the different periods,

and exhibiting the characteristics of a national style. Very few brasses are to be found in Wales, and there are only two on record in Ireland, and three unimportant examples in Scotland. For this, as for most other arts that subsequently flourished in Britain, we were indebted to the artists of France and Flanders, who in their turn were debtors to Byzantine craftsmen for the art of working in brass also. Of late years there has been a decided revival, not merely of interest in the art, but in the use of it in Britain for its original purpose—for the most part in rather close imitation of ancient patterns and methods.

See Cotman's *Sepulchral Brasses in Norfolk* (1819), Boutell's *Monumental Brasses of England* (1849), Haines' *Monumental Brasses* (1861), Greeny's *Monumental Brasses of the Continent of Europe* (1884), and Macklin's *Monumental Brasses* (1891; 6th ed. 1913), and *Brasses of England* (1907).

Brass Estuary, or **BRASS RIVER**, one of the deltaic mouths of the Niger (q.v.), east of the Nun mouth, entering the sea about 6° 15' E. long. On it is Brass City, and hence the Brassmen, energetic savages, are named. The country is in Nigeria.

Brassey, THOMAS, the great railway-contractor, was born, a farmer's son, at Buerton near Chester, 7th November 1805, was educated at Chester, articled to a land-surveyor, and in 1826 had charge of a business in this line at Birkenhead. In 1834 he obtained, through George Stephenson, contracts for a viaduct on the Grand Junction line. Settling in London in 1836 he turned his great energies and business ability into his profession as a railway-contractor, for which the development of the railway-system presented a good opening. His operations soon extended to all parts of the world. Amongst his chief contracts was the Great Northern Railway (1847-51), when he had in his employment between 5000 and 6000 men; as also French, Italian, Canadian, Australian, and Indian railways. He died at Hastings, 8th December 1870. See *Life by Helps* (1872).—His eldest son, THOMAS, EARL BRASSEY (1836-1918), born at Stafford, was called to the bar in 1866. He was elected for Devonport in 1865, and afterwards represented Hastings (1868-86). As Civil Lord of the Admiralty (1880), and Secretary (1884), his influence was felt in naval questions, and he was author of several works on seamanship, naval affairs, and yachting. He was made K.C.B. in 1880, a baron in 1886, and an earl in 1911. In 1895-1900 he was governor of Victoria. Lady Brassey's pleasant records of the yacht voyage round the world in 1876-77, and of succeeding trips of the *Sunbeam*, including the *Last Voyage* (1889), were widely popular. She died at sea, 14th September 1887.

Brassica, the turnip and cabbage genus of the Cruciferae (q.v.). The Wild Cabbage (*B. oleracea*) occurs on the west and south coasts of England, Ireland, and the Continent, particularly on sea-cliffs. The cultivated forms are of great economic importance, and are enumerated by Hooker as varieties: (a) *acephala* (Scotch kale, cow-cabbage, borecole, see GREENS); (b) *bulleata* (savoy); (c) *gemmifera* (Brussels Sprouts, q.v.); (d) *capitata* (red and white cabbage, see CABBAGE); (e) *caulorapa* (Kohlrabi, q.v.); (f) *botrytis* (Cauliflower and Broccoli, q.v.). The Turnip (*B. campestris* [*polymorpha*]) has also many annual or biennial varieties: of these *B. campestris* proper is cultivated as the Swedish turnip. *B. campestris*, sub-species *Rapa*, is the common Turnip (q.v.); and the sub-species *Napus* is the rape or coleseed. The Isle of Man Cabbage (*B. monensis*) occurs on sandy shores, and its cultivation in such soils has accordingly been suggested as fodder for cattle. For the sub-genus *Sinapis*, see **MUSTARD**.

Brasso, Magyar name of Kronstadt (q.v.).

Brathwaite, RICHARD, minor poet, was born in Westmorland about 1588; entered Oriel College, Oxford, at sixteen; passed afterwards to Cambridge, Pembroke College most likely, and thence to London, where he tells us he devoted himself to poetry and play-writing. In 1611 he published *The Golden Fleece*, a collection of poems, and in 1614 three works, one of them a book of pastorals, entitled *The Poet's Willow*. In 1615 he published the collection of satires, *A Strappado for the Devil*, in imitation of *The Abuses Whipt and Stript* of George Wither, his 'bonnie brother.' After his first marriage, Brathwaite lived the life of a country gentleman in Westmorland, and after his second in Yorkshire, without, however, ceasing his literary activity. He died near Richmond, in Yorkshire, in 1673. Of his numerous books, the only one that remains to be mentioned is *Barnabee Itinerarium*, or *Barnabee's Journal*, published in 1638 under the pseudonym 'Corymbæus.' Often reprinted under the title of 'Drunkon Barnaby's Four Journeys,' this lively book in rhymed Latin and doggerel English verse was popular in the 18th century. With the seventh edition, edited by Joseph Haslewood in 1818, its authorship was first made known. See the life and bibliography in Haslewood's ninth edition (1820).

Bratianu, or **BRATIANO**, JON (1821-91), Rumanian statesman and writer, took part in the revolutions of 1848 and 1866, and was Liberal prime-minister in 1876-88. His son JON (born 1866) was several times prime-minister, and in 1916 brought Rumania into the Great War. See **RUMANIA**.

Bratislava, Czech name of Presburg (q.v.).

Bratislavia, Latin name of Breslau (q.v.).

Brattleboro, a town of Windham county, Vermont, 95 miles S. of Montpelier, on the Connecticut River, here bridged. Organs, carriages, furniture, and machinery are made, and the town is a centre of the maple-sugar industry. Pop. 8000.

Brauer, ADRIAN. See **BROUWER**.

Braun, ALEXANDER, born at Ratisbon in 1805, was professor of Botany at Berlin from 1852 till his death, 29th March 1877. He did special service in the departments of the morphology of plants, systematisation, and the lower cryptogams. See his *Life by Mettenius* (Berlin, 1882).

Braun, AUGUST EMIL, archaeologist, born at Gotha in 1809, studied at Göttingen and Munich, and in 1833 went to Rome, where in a short time he was made secretary to the Archaeological Institute. He wrote many valuable works on art and mythology in German and Italian. Of these the most important are his *Vorschule der Kunstmythologie* (1854), and an admirable guide-book, *Die Ruinen und Museen Roms* (1854), both of which have been translated into English. He died in Rome, September 12, 1856.

Braunsberg, a town of East Prussia, on the navigable Passarge, 8 miles from its mouth, and 38 miles SW. of Königsberg by rail. It contains a Catholic seminary and gymnasium, oil and flour mills, breweries, match and soap factories. A considerable trade is carried on in yarn, grain, flax, and ship-timber. Pop. 15,000.

Braunschweig. See **BRUNSWICK**.

Brauer. See **BROUWER**.

Bra'vo ('excellent!' 'well done!'), an Italian exclamation of praise, the superlative form of which is *Bravissimo!* It is commonly used in England without distinction of number or gender; but the Italians say *bravo!* to a male singer or actor, *brava!* to a lady, and *bravi!* to a company.

Bravoës were those persons in Italy, but

especially in Venice, who undertook to perform any dangerous deeds for money. The name is now employed chiefly to designate hired assassins.

Bravura, an Italian word, in music applied to a composition as well as style of performance. As a composition, the bravura is a florid air or song, with many difficult and rapid passages, requiring great spirit and dexterity of execution. The intention of merely astonishing by execution has been carried to such an extent that it has brought this species of composition into undeserved discredit. The compositions of Mozart, for instance, give abundant proofs of how true artistic merit may be united with the bravura style.

Brawne, FANNY. See KEATS.

Braxfield, ROBERT MACQUEEN, LORD (1722-1799), 'hanging judge,' the son of John Macqueen of Braxfield, Sheriff-substitute of the Upper Ward of Lanarkshire, was educated at Lanark Grammar School and Edinburgh University, and apprenticed to a Writer to the Signet. Called to the bar in 1744, he soon had the best reputation and practice as a feudal lawyer in the country. He was made a Lord of Session in 1776, Lord of Justiciary in 1780, and Lord Justice Clerk in 1788. He presided at the trials of Muir, Skirving, and others for sedition in 1793-94, and in these, says Cockburn, 'he was the Jeffreys of Scotland.' He even wrote privately to Dundas, urging that no mercy should be shown. 'Bring me the prisoners,' he used to say when consulted as to a political prosecution, 'and I will find you the law.' He was coarse, brutal, and domineering, and delighted in indecorous jests, but he was a man of remarkable vigour of intellect. See Stevenson's *Weir of Hermiston*, Cockburn's *Memorials*.

Braxy, or SICKNESS, a very fatal disease of sheep, which frequently causes a heavy mortality in some parts of the country. It is very rapidly fatal, and animals are more frequently found dead than seen ill. There is no doubt but deaths are ascribed to braxy which are due to other causes. Although it may occasionally occur in any part of the country, it is the wet hilly districts on our west coast that its ravages are mainly felt. The late Professor Hamilton of Aberdeen—head of the Departmental Committee—stated that it was met with on the west coasts of countries touched by the Gulf Stream—the Shetland and Faeroe Isles, Iceland, and the west coast of Norway. It attacks mostly lambs, and sheep under two years old, but occasionally an older animal may succumb to it. Decomposition sets in rapidly after death. Often by the time the carcass is found it is distended with gas, the legs sticking straight out, the skin of the belly getting discoloured, and the wool easily pulled off. On opening the carcass the smell is very powerful, penetrating, and disagreeable; hence the name 'stinking-ill' sometimes applied to the disease. The tissues are all darker—redder—than normal, and hæmorrhages, mostly small points, are found on nearly all surfaces—often largest and most obvious inside the true stomach. According to Dr M'Gowan, they are more constant on the heart and its membranes in minute points, and the heart sack full of an amber-coloured or blood-stained fluid. The flesh is said to be harmless, and in districts where the disease is prevalent 'braxy mutton' is a recognised article of food.

Probably owing to the heavy mortality sometimes caused by it, more inquiry has been directed to the causation and prevention of braxy than to any other disease of stock in this country. The Board of Agriculture appointed a 'Departmental Committee' to inquire into it, and their final report—published in 1906—ascribed the disease to

a bacillus found in the peritoneal cavity, and as a preventive recommended drenching the lambs with cultures of this bacillus. A subsequent investigator, Dr M'Gowan, who worked under the auspices of the Board of Agriculture for Scotland, denies the pathogenic nature of this organism, and states that it is a common putrefactive bacterium due to decomposition. He claims that the specific agent in the causation of the disease is a much smaller organism, which he discovered in the blood, and termed the *Bacillus bipolaris septicus ovium*.

Amongst the causes that seem obvious to flock-masters are sudden changes of weather and of food, more particularly from poor to rich pasture; storms of wind and rain; frosty nights after fairly warm days, especially when all vegetation is covered with hoar-frost in the morning; foul pasture; and some parts of a sheep-run—especially hollows—are more liable to cause it than others. The disease is most common in the autumn from September onwards, and again in spring it is sometimes prevalent. Treatment is seldom available, as the victim is usually found dead. As it is generally the best of the flock that are attacked, the most vigorous and thriving, temporarily to stop or check this thriving is considered a means of prevention. It is to this cause that many ascribe the diminished mortality claimed to be derived from drenching the lambs with a mixture of pig-dung and milk. Good and careful heiding, watching the weather, and not allowing the sheep on to rank foggage with hoar-frost on it, and, if frost cannot be avoided, putting the flock on the cleanest, barest pasture available, where it is impossible for them to fill their stomachs rapidly with frosted grass, are recommended.

Bray, a small Berkshire parish, near Maidenhead, of which Simon Aleyn was vicar from 1540 to 1588, during the reigns of Henry VIII., Edward VI., Mary, and Elizabeth. He kept his vicarage by changing his faith according to that of the state for the time being, becoming a Protestant with Henry, Catholic again in the reign of Mary, and Protestant again on the accession of Elizabeth. His principle was to live and die vicar of Bray, and to it he adhered. The modern ballad, *In Good King Charles's Golden Days*, makes the versatile vicar live in the reigns of Charles II., James II., William III., Anne, and George I.

Bray, a seaside town, partly in Dublin county, but chiefly in Wicklow, 13 miles SE. of Dublin by rail. The beauty of its situation has raised it from a small fishing-village to a watering-place, popularly known as the 'Irish Brighton,' with well-built houses, and an esplanade a mile long, hotels, and Turkish baths. Pop. 7700.

Bray is a district of Normandy, now the south-eastern part of Seine-Inférieure, famous for its cattle and dairy produce.

Bray, ANNA ELIZA (*née* Kempe), author, was born in London, 25th December 1790, and was intended for the stage, but in 1818 married the artist Charles Alfred Stothard (q.v.). In 1825 she married the Rev. E. A. Bray (1778-1857), vicar of Tavistock; and after his death she settled in London, where she died, 21st January 1883. Between 1820 and 1874 she published a score of romances, books of travel, and other works, the best being *The Borders of the Tamar and the Tavy* (1836; 2d ed. 1879); *Life of Thomas Stothard, R.A.* (1851); and *A Peep at the Piesies* (1854). See her *Autobiography* (ed. Kempe, 1884).

Bray, THOMAS, divine and philanthropist, born at Marton, in Shropshire, in 1656. From Oswestry School he passed to All Souls, Oxford, where he graduated in 1678. In 1690 he was presented to the rectory of Sheldon, and there he wrote part of

his *Catechetical Lectures*, which brought him a wide reputation. Soon after he was selected to act as the Bishop of London's commissary in Maryland in the settlement of the church there. Not being able to start at once, he devoted himself with characteristic energy to a scheme for establishing parochial libraries in England and America, and had such success that before his death eighty had been founded in England and thirty-nine in America. Out of his library scheme grew the Society for Promoting Christian Knowledge; and he may also be regarded as the founder of the Society for the Propagation of the Gospel. About the close of 1699 he sailed for Maryland, but in 1706 returned to England to accept the living of St Botolph Without, Aldgate, where he laboured with the utmost devotion. He died 15th February 1730.

Brayera. See CUSO.

Brazenose College. See OXFORD; and for Roger Bacon's brazen head, see GREENE's play of *Friar Bacon and Friar Bungay*.

Brazil, the largest state of South America, and the third largest political division of the Western Continent, has a length of 2660 miles, and a breadth of 2700 miles, between extreme points. Its coast-line extends from Cape Orange on the north to Rio Chuy on the south, a distance of nearly 4000 miles. It borders on every state in South America except Chile, Ecuador, and Panamá. The boundary lines with some of them were long in dispute, but all have been settled by treaties. The area of Brazil is estimated at $3\frac{1}{2}$ million sq. m., or nearly one-half of the South American continent.

Physical Features.—Brazil is a triangular-shaped country, occupying the eastern angle of the continent. It lies almost wholly within the tropics, and is still in great part unexplored and unsettled. On the north and west are the great depressions of the Amazon and Paraguay rivers, which comprise large areas of flood-plains and swamps, heavily wooded, and almost uninhabitable. The upper coast is bordered by low, alluvial bottom-lands and sandy plains, full of lakes, and in places very sterile; while the southern angle of the country is rolling *campo* land, bordered by a low sandy coast. Above its eastern angle a large area of coast-lands and neighbouring plateau is subject to periodical devastating droughts. The interior of the country, however, is a high plateau, with a general elevation of 1000 to 3000 feet, irregularly ridged by mountains and deeply cut by large rivers. The mountain ranges of the maritime system form the eastern margin of this plateau, the easternmost of which is known as the Serra do Mar. This range plays an important part in the development of Brazil, for it is a costly barrier to communication with the interior, and turns nearly all the great rivers inland to find outlets through the distant Amazon and La Plata. To the west of the maritime system the elevated tablelands of the Paraná and São Francisco make great bay-like indentations in the northern and southern margins of the mountainous area, nearly uniting about the head-waters of the latter. To the westward of these plains there is a second range, nearly parallel with the maritime system, constituting the mountains of Goyaz. To the westward of these come the great elevated plains of the Amazonian and Upper Paraguayan regions. The mountains are composed almost exclusively of uplifted strata of great geological age, gneiss and metamorphic schists, with granite and other igneous rocks. The great elevated plains are composed of horizontal strata dating from the Silurian age, profoundly modified by the deep excavations of the valleys. Brazil possesses three great river-systems

—the Amazon, La Plata, and São Francisco. The Amazon and its tributaries drain fully a half of the country. To the east of the Madeira these tributaries are tableland rivers, broken by rapids and freely navigable for comparatively short distances. West of the Madeira they are lowland rivers, sluggish, bordered by extensive flood-plains, and afford free navigation for long distances. The La Plata system drains nearly one-fifth of the country through its three branches—the Paraguay, Paraná, and Uruguay. The first of these is a lowland river, freely navigable for a long distance, while the other two are tableland rivers, full of obstructions, and without free outlets for their upper-level navigation. The São Francisco is a tableland river, flowing north-east between the Goyaz and maritime mountains, and then, breaking through the latter, south-east to the Atlantic. Its tributaries are comparatively short, and nearly disappear along the lower river in the region of slight rainfall. It is not freely navigable because of the Paulo Afonso Falls. The other coast-rivers are generally short, the longest being the Parahyba, and have but little utility for navigation. The climate of Brazil varies greatly—the lowlands of the Amazon (q.v.) and a great part of the coast being hot, humid, and unhealthy, while the tablelands and some districts of the coast swept by the trade-winds are temperate and healthy. See AMERICA.

The vegetation of Brazil is luxuriant and varied. The vast forests of the Amazon contain hundreds of species of trees, draped and festooned by climbing plants, orchids, &c. Rosewood, Brazil-wood, and others supply valuable timber; tropical fruits and other useful products are abundant. The number of animal species is also very large, but the individuals in each are comparatively few. Beasts of prey are the jaguar, puma, tiger-cat, and ocelot; other animals include monkeys, tapir, capybara, peccary, ant-eater, sloth, and boa-constrictor. Alligators, turtles, porpoises, and manatees swarm in the Amazon; parrots and humming-birds are especially numerous.

Population.—In 1872 the population of Brazil numbered 9,930,480. In 1890 the number was 14,333,915, including about 6,302,200 whites, 4,638,490 half-breeds, 2,097,425 negroes, and 1,295,800 Indians. The census of 1920 gave a population of 30,645,296, or 9·3 to the square mile. For a time land was given to settlers for one or two dollars an acre, and immigrants averaged 150,000 yearly; when this grant was discontinued in 1893 the numbers declined. Of over a million immigrants to Brazil in 1908–19, 386,696 were Portuguese, 165,709 Italians, 36,246 Germans, 10,498 French, 7730 British, and 1573 Belgians. Italian and German colonists number several millions. The African slave-trade was prohibited in 1831, but did not actually cease till 1854. In 1871 a gradual emancipation law was adopted, which declared the children born thereafter of slave mothers to be free, but obliged to serve the mother's master until the age of twenty-one years. It also provided for a fund with which to liberate slaves by purchase. The number of slaves registered in 1873 under this law was 1,540,796. The number of slaves voluntarily liberated and ransomed through private efforts was very large, and two provinces (Ceará and Amazonas) had been declared entirely free. In 1885 a second law was adopted, providing for a new registry, declaring all sexagenarians free, but with obligatory service until the age of sixty-five years, and fixing an official valuation on all slaves, to prevent further abuses of the emancipation fund. Finally, by the law of 13th May 1888, immediate and unconditional emancipation was decreed, although Brazil had been unable wholly to replace the system of slave labour. Immigrant labour was

still limited, the poorer rural population was both untrained and opposed to habits of industry, and the labour of freed slaves had hitherto been utilised only to a limited extent. Experience proved, however, that kind treatment and good pay will keep a very large percentage of the freedmen on the plantations.

The Roman Catholic was the established religion under the empire; under the republic there is no state church, and all sects are tolerated. Education is free, but not in general compulsory, and is still in a very backward condition, the great bulk of the population being illiterate. The language is Portuguese, with dialectal varieties, discussed by Vasconcellos in *O dialecto Brasileiro* (Oporto, 1883); and the literature, which dates back to the 16th century, will fall to be noticed under PORTUGAL. The *lingoa geral*, the jargon used in intercourse with the many Indian tribes, is founded on the language of the Tupi Indians.

Government.—Under the empire the government of Brazil was a constitutional monarchy whose executive governed through a cabinet of seven members—empire, finance, war, marine, justice, foreign affairs, and agriculture—and through a president in each of the twenty provinces of the empire. The executive power was vested in the emperor and his cabinet, the legislative in a General Assembly of two houses—the Senate and Chamber of Deputies—and the judicial in a council of state (advisory only), a supreme tribunal, twelve district courts, and the usual subordinate courts. At the revolution of 1889 the empire became a republic, and in 1891 the new constitution was proclaimed by a national congress convoked by the provisional government. The United States of Brazil are a federative republic, each of the old provinces forming an organised state administering its own affairs at its own expense, and having distinct administrative, legislative, and judicial bodies. The city of Rio de Janeiro, as capital, is not included in the state of the same name, but in a federal district. An area in the state of Goyaz, on the plateau between Pirenópolis and Formosa, has been selected as the site of a future capital and federal district. Some 60,000 sq. m. acquired from Bolivia in 1902 form the territory of Acre. The federal government takes charge of national defence, public order, and federal law, as well as import duties, stamps, postal arrangements, and the issue of bank-notes. The national congress, the legislative authority, consists of a Chamber of Deputies and a Senate, which meet annually; and the president's sanction is required to new laws. No member of congress can accept any paid office except diplomatic or military; nor can he hold contracts under government. Neither deputies nor senators can be ministers of state; both are paid. Deputies, who must have been citizens of the republic for four years, are elected by the direct vote of the several states for three years, in the proportion of one to 70,000 of the population. Senators are chosen by direct vote, three for each state, and three for the federal district. They are elected for a term of nine years, one-third of the house being renewed every three years. The president, also directly elected, has supreme command of army and navy, power to declare war and make peace (within certain defined limits), appoints and dismisses ministers, and, with the assent of congress, ambassadors and the judges of the Supreme Federal Court. All male citizens of twenty-one years duly enrolled exercise the franchise, except illiterates, beggars, soldiers in service, and monastics under vows.

The army of Brazil has a peace footing of 54,000 men, besides 26,000 gendarmerie. The navy is manned by 10,000 officers and men.

The revenue and expenditure of Brazil vary greatly from year to year. Most of the revenue is derived from import duties. The public debt is heavy, and the various states and municipalities are also weighed down. The milreis of 1000 reis is of the par value of 2s. 2½d.; but the actual value of the paper milreis fluctuates greatly. In 1891 it was 12½d.; in 1896, between 8d. and 10d.; in 1898, 5½d.; in 1903, about 10d.; in 1922, 1s. 4d.

Commerce and Productions.—The total value of the exports from Brazil in 1920, exclusive of specie, was £107,500,000; and of the imports, £125,000,000. The industries are almost confined to agriculture, mining, and forest products, manufactures being but slightly developed. There is some cotton-weaving, however, and other textiles, tobacco, and flour are manufactured. Stock-raising has attained some importance. Chilled and frozen beef, leather, and hides are exported. The coast fisheries have been neglected, although Brazil is a large consumer of codfish; but something is being done to remedy this. The forest products include rubber, maté, nuts, cocoa, medicinal plants, cabinet and dye woods. The lumber industry is being developed. Only a small portion of the surface is under cultivation, large tracts being mountainous or otherwise totally unproductive. Of agricultural products, coffee, chiefly from the south-east (São Paulo), occupies the first place, and furnishes from half to nine-tenths of the total exports of the whole country, and most of the world's supply. Brazil is very important also as a producer of rubber, which is shipped from Pará and Manaos. Sugar, too, ranks high, and receives special encouragement from the state. The production of cotton and tobacco is extensive: that of tapioca has nearly disappeared. Rice, maize, and many other products are easily grown, but have been overshadowed by coffee, rubber, and sugar, and to some extent discouraged by the high cost of internal transportation. The mines are important. Gold and diamonds are found in Minas Geraes, Paraná, Bahia, Goyaz, and Matto Grosso, but the annual production at present is not large. Iron ores of superior quality exist in several provinces, but there are no large mines in operation, the inferiority of Brazilian coal being a serious obstacle to the development of this important industry. Manganese is worked. Brazil is the chief source of monazite. Some petroleum and other minerals are got. The policy of levying export duties on domestic products, and very heavy import duties on foreign goods, has been accused of doing much to restrict production and commerce; but the system of protection is gaining ground, and industries have been established on the encouragement given. A land-tax would be opposed by the great landed proprietors. It should be added that the inhabitants of the southern states are broadly distinguished by their energy from the more indolent northerners. It is in the southern provinces that the numerous German colonies are mostly established.

Steam communication with Europe was opened in 1850, and telegraphic communication in 1874. There are over 40,000 miles of inland waterways. The first railway was opened in 1854; Brazil now possesses a total extension of some 18,000 miles, of which 10,000 belong to the union and 8000 to the various states. There are 55,000 miles of telegraph lines in Brazil, including 11,000 miles of submarine cables. A system of wireless stations has been installed.

History.—As early as 1480, expeditions sailed from Bristol in search of the island of Brasylle (for the name, see BRAZIL-WOOD), rumoured to exist in the western seas; Brazil was discovered on 26th January 1500 by Vicente Yañez Pinzon, who landed

at Cape St Augustine, near Pernambuco, and then followed the coast north to the Orinoco. In the same year a Portuguese expedition to the East Indies, under Pedro Alvarez Cabral, discovered the Brazilian coast near Porto Seguro on 25th April (April 22, *Cazal*). Cabral took formal possession, and named his new discovery 'Terra da Vera Cruz.' Two Portuguese expeditions were sent out in 1501 and 1503, the first exploring the coast from 5° to 32° S. lat., and the second planting a colony and bringing back a rich cargo of Brazil-wood (q.v.), which gave a name to Portugal's new possession.

In 1530 the Portuguese government resolved upon the definite settlement of Brazil, and the plan adopted was its division into hereditary captaincies, which should be granted to private individuals, with ample powers for the founding of colonies on their own account. Many of the earliest colonies failed through lack of means, and from inability to hold their ground against the natives. In 1567 a Huguenot colony, established on the bay of Rio de Janeiro twelve years before, was overthrown by the Portuguese, who then founded the present capital of Brazil. Portugal and her colonies having become dependencies of Spain, a squadron sent out by the Dutch in 1623 to seize Brazil captured the colonial capital, Bahia. The Dutch lost the city in 1625, but in 1630 they captured Pernambuco, which, with several neighbouring places, they held for over twenty years. In 1640 Portugal regained her independence, and in 1654 her former possessions, but without any definite settlement of her boundary disputes with Spain. To strengthen her claim to the territory on the eastern shore of the La Plata, the town of Colonia, opposite Buenos Aires, was founded in 1679; this was the beginning of a bitter struggle for the present republic of Uruguay, lasting nearly 150 years, until the independence of that territory was formally recognised in 1827 by Dom Pedro I. The discovery of gold in Minas Geraes in 1693, and of diamonds in 1729, gave a new impetus to the growth of the country, one result of which was the removal of the colonial capital from Bahia to Rio de Janeiro. The cultivation of cotton, tobacco, and sugar-cane had already attained great prominence and prosperity in the northern captaincies. The colonial system of Portugal, however, was one of selfish exclusion and greedy extortion. The colony was rigidly closed to foreigners, industry was burdened by restrictions and monopolies, the taxes were farmed out, the authorities were arbitrary and grasping, the administration of justice was slow and corrupt, printing was forbidden, the people were grossly ignorant, turbulent, and immoral, and internal communication was slow and difficult. In 1808 the royal family of Portugal was expelled by the French and took refuge in Brazil, and the very first act of Dom João VI. was to open Brazilian ports to foreign commerce. He then removed various restrictions on domestic industries, founded a printing-office and library, created new courts, and opened various schools and public institutions. All these acts greatly stimulated the growth of the country. In 1821 he returned to Portugal, leaving his eldest son in Brazil as prince-regent. Personal ambition, and the advice of men opposed to government from Lisbon, led the young prince to declare for Brazilian independence, 7th September 1822. He was proclaimed and crowned emperor—as Dom Pedro I.—before the end of the year, the small Portuguese force in the country being quickly and easily expelled. The constitution was ratified and sworn to early in 1825, and some amendments were added in 1835. The new empire, however, did not start smoothly, nor was the reign of Dom Pedro I. a fortunate one. Vexed with the opposition encountered, he in 1831 voluntarily abdicated in

favour of his eldest son, and withdrew to Portugal. During the next nine years Brazil was governed by regencies, but in 1840 a popular agitation led to the declaration of the young prince's majority, at fifteen years of age, and to his coronation the following year as Dom Pedro II. The reign was one of almost unbroken peace, interrupted by two wars—one with Buenos Aires in 1852, and the other with Paraguay in 1865-70. At the revolution of November 1889 the empire became a republic, and Dom Pedro and his family were exiled. In 1893-94 a revolt led by two admirals and supported by the navy had to be suppressed. Another naval revolt in 1910 won some reforms. Brazil in 1917 entered the Great War on the side of the Entente.

Smith (1880), Wells (1886), Fonseca and Almeida (1899), Lamberg (1899), Plane (1903), Sellin (1909), P. Wallé (1912), Koebel (1919), Roosevelt (1914), and James (1925), and for history, the works of Southey (1810-19), Costancio, Pereira da Silva, Fialho (1891), Akers (1904), and Grossi (1905).

Brazil, a city of Indiana, 55 miles SSW. of Indianapolis, in a region producing coal, shale, and clay, has iron industries; pop. 9000.

Brazil Cabbage, CHOU CABAIBE, are names somewhat vaguely applied to various species of *Caladium* and *Colocasia* (natural order, Araceae), which yield edible tubers, and are largely cultivated in the tropics. See ARUM, COCCO.

Brazilian Arrowroot. See MANIOC.

Brazilian Grass, an incorrect popular name applied to a substance used in the manufacture of a very cheap kind of hats, known as Brazilian grass hats, and also as *chip* hats. It consists of strips of the leaves of a palm, *Chamærops argen-*

Brazil Nut:

α, the fruit; b, the same, with half the pericarp removed to show the nuts or seeds; c, a single nut or seed; d, a nut cut across; e, a leaf.

tea, which are imported into Britain for this manufacture, chiefly from Cuba. See CHAMÆROPS.

Brazilian Plum. See HOG PLUM.

Brazil Nuts are the seeds of the *Bertholletia excelsa*, a majestic and beautiful tree belonging to the Lecythidaceae, related to Myrtaceae (q.v.). The tree grows to the height of 100 or 120 feet, and abounds on the banks of the Orinoco, and in the

northern parts of Brazil. It produces a round woody seed-vessel, almost as large as a man's head, within each of the four divisions of which lie six or eight of the seeds. The pericarp is very heavy and solid; and at the time when this great fruit is ready to fall it is dangerous to walk under the tree. The seeds, which are popularly called nuts, and much resemble fruits of that description, are wrinkled and triangular, having a hard shell and a pure white kernel, which, when fresh, is very agreeable. They are chiefly exported from Pará and French Guiana. They yield as much as 56 per cent. of edible oil, which is good for burning, soap-making, lubricating watches, and other purposes.

Brazil-wood, a dark-red or yellowish-brown dye-wood, which forms a considerable article of export from Brazil. It is the produce of different species of *Cæsalpinia* (q.v.). Much of the Brazil-wood of commerce is obtained from the heart-wood of *Cæsalpinia brasiliensis*, a native of the West Indies.—**PERNAMBUCO WOOD** is the produce of *C. echinata*, sometimes regarded as the Brazilian form of the preceding species. The timber is called Nicaagua-wood. The Sappan-wood (*C. Sappan*) of the East Indies has similar properties, and is described as an article of European commerce in 1193 under the name of *brasil*, *brasilly*, &c. (cf. Span. *brasil*; Fr. *brésil*, for which Marco Polo has *berzi*). Thus Brazil-wood does not really owe its name to Brazil, but the country to its abundance of red dye-woods. *C. crista* probably yields some of the inferior West Indian Brazil-wood.

The colouring matter is termed *brasilin*; strong decoctions of Brazil-wood are used by the dyer and calico-printer in the fabrication of reds, browns, &c.; it is also used in the manufacture of red ink. See **INK**, and **SANDALWOOD (RED)**.

Brazing, or **SOLDERING**, is the process of uniting together two pieces of brass, two pieces of copper, or one of each, by means of a hard solder, partaking more or less of the composition and properties of ordinary *brass*. The edges or parts of metal to be joined are first filed bright, so as to be thoroughly clean, then there is strewed over the joint a mixture of the solder and borax. The solder employed varies in composition according to the kind of work, and may be rendered more fusible by the addition of a larger amount of zinc. Hard solder, or 'spelter solder,' for brass consists of 1 part of copper to 1 of zinc; for copper or iron it is usually 1 part of copper to $\frac{2}{3}$ of a part of zinc. The proportions, however, vary, 3 of copper to 1 of zinc being about the hardest solder. After the solder is made it is again heated and granulated in a mortar for use. The borax is employed to form a glaze over the brightened surfaces, and thus prevent the oxidation of the metal, which would seriously interfere with brazing, and even stop the operation. An outward coating or layer of charcoal is likewise serviceable in the exclusion of the air during the brazing of large pieces of metal. Where a very high heat is required in the process, a little powdered glass is mixed with the borax. The mixture of solder and borax may be applied dry, but it is better to moisten it with water, and to lay it on the filed surfaces with a spoon. The whole is then gently heated, when the water evaporates and leaves a crust of borax and solder. The work may now be strongly heated by a bellows, blowpipe, or over a clear charcoal or coke fire, and at a bright red heat the solder fuses and the zinc begins to burn with a pale-blue flame. At this stage the solder *flushes* or becomes liquid enough to permeate the joint or crevice; but should it be tardy in acting thus,

several slight taps will ensure the proper result. The whole is now cooled, and, towards the close, the articles may be introduced into cold water for more rapid reduction in temperature. Pieces of metal which have undergone the process of brazing are so firmly united that they may be rolled and re-rolled without the parts yielding. Steel is brazed with a solder composed of 19 parts silver, 1 of copper, and 1 of brass. See **SOLDER**.

Brazos, formerly **BRAZOS DE DIOS**, a river of Texas, U.S., rising in a tableland called the Staked Plain, in the NW. of the state, and running 950 miles south-eastward, till it falls into the Gulf of Mexico about 40 miles SW. of Galveston. It is navigable at all times to a distance of 40 miles from its mouth, and at high-water for 250 miles.

Brazza (Croatian *Brač*), the largest of the Dalmatian islands of the Adriatic, with an area of 152 sq. m., inhabited by Croats. Its surface is mountainous and richly wooded; marble is quarried. San Pietro and Milna are the chief towns.

Brazza, **PIERRE SAVORGNIAN DE** (1852-1905), a distinguished French explorer, of Italian descent, was born on board a steamer in the harbour of Rio de Janeiro. He studied at Paris, entered the French navy in 1870, and served on the Gabon station. In 1876-78 he made a famous exploration of the Ogowé, and of some of the northern tributaries of the Congo. In 1878 the French government gave him 100,000 francs for exploration and the promotion of French interests in the country north of the Congo, where he secured vast grants of land for France, and founded several stations, that called Brazzaville being on the northern shore of Stanley Pool. In 1883 he returned to extend the territory secured to France, this time with a government grant of 1,275,000 francs, besides stores and provisions of all kinds; and by the end of 1885 he had established twenty-six stations, Franceville being the chief. The securing for France of her great dependency lying between the Gabon and the Congo is mainly his work; and of that dependency he was governor from 1886 till 1897.

Breach, in a military sense, is a gap or opening in any of the defences of a fortress, effected either by mining or by the fire of guns placed in what are called 'breach-batteries.' The earthen ramparts of all fortresses are surrounded by deep ditches. In order to support the weight of the rampart, and make the ditch a more formidable obstacle, its sides are built up with retaining walls of masonry, technically called 'revetments,' often 30 feet high and 15 feet thick at the foot. To breach by mining, the explosives are lodged at the back of the revetment and near its foot under the parapet in sufficient quantities to bring down the greater part of the whole bank of earth and retaining wall. The debris falling into the ditch forms a ramp or slope, up which the assaulting party rush into the fortress. At the same time the wall retaining the far side of the ditch, called the 'counterscarp,' is treated in a similar manner to facilitate the descent into the ditch. The same result may be obtained by artillery fire. Heavy howitzers are placed in batteries at 3000 or more yards from the 'escarp' or revetment of the rampart, upon which they drop shell, crumbling it away from the top downwards, until a practical breach is made. During the Peninsular war there were some formidable examples of breaching. At Badajoz 14,000 shot brought down 180 feet of wall in 104 hours, from a distance of 450 yards. At San Sebastián 13,000 shot brought down 100 feet of wall in 62 days, from a distance of 620 yards. But deliberate breaching by guns is not now so much in vogue; heavy artillery aims at destroying

everything in the fort, and rendering it untenable without actual assault. In the Great War (1914-18) siege howitzers proved capable of complete ruin, in 100 shots, of the revetments, ramparts, gun-emplacements with overhead cupolas of steel, magazines and other concrete-roofed cover, of a very modern fort. See **SIEGE**.

Breach is a legal term used in England and Scotland to denote the violation of a legal right or obligation. The most common form of this is Breach of Contract. A contract may be broken by simple failure to pay or to perform, or by the debtor making it impossible for him to perform before the time arrives, or by his seriously declaring that he will not perform. In some cases the creditor has a right to specific implement—i.e. an order by the court on the other party to do what he promised to do; but in most cases the remedy is an action of damages for breach of contract; and difficult questions arise as to the proper measure of damages. In an ordinary mercantile sale, for instance, if the seller fails to deliver, the buyer must go into the market within a reasonable time to supply himself. On the other hand, if the buyer breaks the contract, the seller should dispose of the goods as soon as possible, and charge the difference of market and contract price. Breach of Trust consists in the violation of the express or implied obligations of a trustee—e.g. making an investment of trust funds not sanctioned by the trust deed, or using trust funds in the business of the trustee. The liability so incurred is generally to replace the funds, sometimes with penal interest. Such acts are often restrained by interdict or injunction at the instance of the beneficiaries. Breach of trust often takes a criminal complexion, and is punished as embezzlement. Breaches of contract are very rarely criminal—indeed only where the element of conspiracy occurs. Breach of the Peace includes a great variety of criminal acts, from mobbing and rioting down to small police offences. In England, Breach of Close is a technical expression for trespass on private ground; Breach of Pound is the unlawful removal of distrained goods which have been impounded—i.e. put in the custody of the law. In Scotland, Breach of Arrestment means the disregard of the prohibition to pay or deliver, which is effected by the use of arrestment in the hands of a debtor; it involves only civil consequences—viz. the liability to pay or deliver a second time. Breach of Interdict, on the other hand, is regarded as a more serious contempt of court, and is often severely punished criminally. Breach of Prison is the escape from arrest of a person lawfully arrested for crime. See **CONTRACT**, **DAMAGES**, **TRUST**, **WARRANTY**; and for Breach of Promise of Marriage, see **MARRIAGE**. See also **BREAKING INCLOSURES**.

Breaching Tower, or **BEFFROI**, a movable tower brought near the wall of a besieged town in ancient and medieval times. Its use is more than once spoken of by Cæsar in his account of his campaigns in Gaul. Froissart describes, with his usual spirit, a beffroi employed at the siege of the castle of Breteuil in 1356. At the siege of Jerusalem by the Crusaders, a beffroi was carried in pieces, put together just beyond bow-shot, and then pushed on wheels to a proper position. Sometimes they were pushed on by pressure, sometimes by capstans and ropes. The highest were on six or eight wheels, and had as many as twelve or fifteen stories or stages; but it was usual to limit the height to three or four stages. They were often covered with raw hides to protect them from the flames of boiling grease and oil directed against them by the besieged; and there was a

hinged drawbridge at the top to let down upon the parapet of the wall to aid in landing. The lower stage frequently had a ram (see **BATTERING-RAM**); while the others were crowded with bowmen and slingers; or there were bowmen on all the stages except the top, which had a storming or boarding party. The *locus classicus* for a description of such military engines is this from Lord Berners' *Froissart*, I. cix. 131: 'Two belfries of great timber, with iii. stages, every belfry on four great wheels, and the sides towards the town, were covered with cure boly [Fr. *cuir bouilli*] to defend them from fire and from shot; and into every stage there were 'pointed C. archers.' The engine was also called a *sow*.

Bread. The earliest and most primitive way of making bread was to soak the grain in water, subject it to pressure, and then dry it by natural or artificial heat. An improvement upon this was to pound or *bray* the grain in a mortar, or between two flat stones, before moistening and heating. A rather more elaborate bruising or grinding of the grain leads to such simple forms of bread as the *oat-cakes* of Scotland, which are prepared by moistening oatmeal (coarsely ground oats) with water containing some common salt, kneading with the hands upon a baking-board, rolling the mass into a thin sheet, and ultimately heating before a good fire, or on an iron plate called a girdle, which is suspended above the fire. In a similar manner, the barley-meal and pease-meal *bannocks* of Scotland are prepared; and in the East Indies (especially the Punjab and Afghanistan), as well as in Scotland, flour is kneaded with water, and rolled into thin sheets, as *scones* (although this term is usually applied to bread lightened with butter-milk and baking-soda.) The *passover cakes* of the Israelites were also prepared in this way. A similar preparation of wheat-flour, but where the sheet of dough is made much thicker, forms the *dampers* of Australia. The Indian corn-meal, kneaded with water and fired, affords the *corn-bread* of America. The kinds of bread referred to above are designated *unleavened*, as no leaven has been added to the dough to excite fermentation. No chemical change has therefore been produced except that the starch has been rendered more soluble by the process of baking. Even in the time of Moses, however, *leaven* was employed in making bread. It is held probable that the Egyptians were the first to use leaven; that the secret afterwards became known to the Greeks; and that the Greeks communicated the process to the Romans, who spread the invention far and wide in the northern countries during their campaigns.

A modern development in bread-making is to use flour artificially bleached by nitrogen oxide. Such flour produces a very white loaf. As to the effect on health, nothing definite can be said in the meantime. So-called 'flour improvers' are also added to flour. These consist mainly of persulphates of alkaline metals, and are all used to whiten the loaf.

The grain of wheat is generally employed in the manufacture of bread among the better classes and more advanced nations, though rye, barley, Indian corn, and rice are also extensively used. The black bread of Germany (pumpernickel) is made of coarse rye flour, and a considerable portion is indigestible.

As a general rule, to which there are exceptions, the wheat becomes more starchy as we proceed southwards. The *strongest* foreign flours (i.e. those richest in gluten) are grown in Minnesota, Manitoba, Hungary, and Russia. Indian wheat usually furnishes a *weak* flour. The principal constituents of wheat may be separated from each other without much difficulty. Thus, if wheat-

flour be placed in a cloth-bag with the mouth well closed, and the whole introduced into a basin of water, and pressed by the fingers for some time, the starch is squeezed through the cloth as a fine white powder, and the gluten is left in the cloth as a viscid or sticky substance. Again, if wheat-flour be burned on a porcelain plate on a fire, or oven, or gas-lamp, till it can burn no longer, it leaves behind a small amount of ash or saline matter.

Previous to being employed in the fabrication of bread, the grain of wheat undergoes the process of *milling*, with the double object of reducing it to a fine state of division, and separating the more hard and indigestible parts (see *MILL*). During the grinding operations, the wheat as it passes from grain to flour nearly doubles its bulk. The products come from the dressing-machine divided into different qualities, a quarter of wheat yielding by some systems of milling:

Flour, 1st and 2d qualities	71.86 per cent.
Bran (small and large)	23.01 "
Germ, sweepings, light wheat, exhaust dust, &c.	3.23 "
Waste.....	1 "
Total.....	100.00

In the making of bread in Great Britain, the flours are blended by the baker so as to produce bread of the desired quality. In the making of good bread three things are absolutely requisite: flour or meal, yeast or leaven, and water containing salt. The Yeast (q.v.) or leaven is added to give a start to the Fermentation (q.v.) process, thereby supplying carbonic acid, which communicates a spongy or light texture to the bread. Leaven is the more primitive ferment, and is simply a portion of moistened flour or dough in which the putrefactive agencies have begun to work. It may be procured by allowing moistened flour to lie in a warm apartment (summer heat) for six or eight days, and when sufficiently formed, has an acid taste and reaction, and a somewhat fusty odour. When brought in contact with a new portion of flour and water, and incorporated therewith by kneading, it very quickly acts as a ferment, and develops partial fermentation in the whole. Hence it is that where leaven is used, it is customary to retain a portion of the leavened dough for the next baking. On the Continent, leaven is still very extensively employed, especially in districts far from breweries. In Britain, yeast is generally used as the ferment. There are three forms in common use—viz. 'brewers' yeast,' 'German compressed,' and 'patent.'

The materials being at hand, and the proper benches, utensils, and oven being within reach, the baker takes a quantity of water and adds to it the yeast and salt; after which the flour is added, and the whole thoroughly and laboriously kneaded together till it assumes a ropy consistence. It is then called the *sponge*, and is placed in a kneading-trough in a warm place, which is styled *setting the sponge*. In a short time, the yeast begins to act on the gluten, starch, and sugar of the flour, compelling the latter to pass into alcohol and carbonic acid gas in every part of the dough, which thereby becomes inflated with innumerable air cavities. When the fermentation has sufficiently advanced, the baker takes the sponge, adds more flour, water, and salt, a second time subjects the whole to a thorough process of kneading, and makes it into dough, after which he allows the mass to lie in a warm place for from one to two hours. The dough swells considerably from distension by gas, and is weighed out into lumps of the proper size, which are shaped into loaves, constituting the *batch*, or placed in tin pans, and allowed to lie for a short time till they get further distended. The oven has previously been heated to a

temperature of at least 450° F., which is the lowest temperature at which bread can be baked, and ranging up to 572° F.; when it has been thoroughly cleaned out, the loaves are introduced, and the oven shut up. Until recent years bakers had not improved upon the method used in the bakeries of Pompeii—viz. by burning wood in the floor of the oven itself until the proper temperature had been reached, then cleaning out and introducing the loaves. Latterly, however, this somewhat inconvenient method has been improved upon, and many large bakeries are fitted with ovens heated either by flues, gas (regenerator), or superheated steam. The heat acts in dissipating much of the water from the dough, in distending the air cavities more fully, and in partially *boiling* the starch and gluten of the dough, and developing some gum from the starch. Indeed, though the temperature of the oven is much higher, yet the loaves beyond the mere crust are bathed in an atmosphere of steam, and are never heated above 215° F., as has been proved by direct experiments with the thermometer. One effect of the heat is to arrest any further Fermentation (q.v.; see also *YEAST*). After about one and a half hours' baking in the oven, the length of time being determined by the temperature, the loaves are withdrawn, and allowed to cool. The brown appearance of the crust of loaves, and the pleasant taste of the crusts, are due to the action of the heat on the starch and the formation of Dextrin (q.v.), a sort of gum. The number of quatern (4-lb.) loaves which a sack of flour weighing 280 lb. yields, is from 86 to 96 according to the strength of the flour. It will be apparent, therefore, that as 280 lb. of flour yield on an average 360 lb. of bread, a good deal more water must be present in the latter than in the former; and, indeed, ordinary good wheaten bread contains about 45 per cent. of water. This water is retained even after the loaf is apparently dry, and even mealy, as the gum and gluten have a great affinity for water.

Machinery has now superseded manual labour in many of the operations of bread-making. In a few of the largest bakeries the flours obtained from various sources are blended by passing through a sifting-machine, and are thence conveyed by a strap or endless screw to large bins. From these bins, when Parisian barm or brewers' yeast is used, the flour is drawn off into barrels or troughs in which the sponge has to be stirred. The stirring is usually performed by means of a vertical spindle provided with horizontal blades, which is made to revolve in a barrel or trough. At the proper time the sponge is emptied into a kneading-machine, the remainder of the water and salt is added, and a quantity of flour is drawn off from the bins sufficient to make the mass of the desired consistency. The whole is now thoroughly mixed into dough. This operation is completed in from five to ten minutes in batches which will turn out from one hundred to five hundred loaves. There are several kinds of kneading-machines in the market, but the two most commonly used are the 'Thomson' and the 'Pfleiderer' machines. They consist essentially of an iron trough provided with blades revolving in opposite directions. In the 'Thomson' machine the blades revolve upon the same axis, while those of the 'Pfleiderer' revolve upon different axes. As soon as the dough is thoroughly made, it is emptied into troughs, where it remains for an hour or two. It is then conveyed to a table and weighed out, and afterwards moulded into loaves as already detailed. There have been several attempts to make machines to divide and mould the dough into loaves, but these have not yet been perfected.

The baking business is chiefly carried on in shops

of moderate dimensions, in which on an average perhaps twenty bags of flour are used per week, but in many large cities the factory system has been introduced. Some of these are on a very large scale, using 1000 to 2000 bags every week. From the nature of the industry, operations are principally carried on at night or early morning. In England till recently almost every family in the country baked its own bread, but the Scottish custom is gradually creeping in, of getting supplied by a baker from a neighbouring town.

The appearance which good wheaten bread ought to present is that of a vesicular or spongy mass, from which layers can be readily detached; and this, known to bakers as *piled bread*, is the best index of good, wholesome, and easily digested bread. When the layers cannot be detached, and the loaf cannot be crumbled down by the fingers into a coarse powder, or the fragments be thoroughly soaked and be readily diffused through water, but become a permanent tough mass of dough, the bread is imperfectly made.

Rye-bread is very extensively used in northern European countries, where the soil being sandy is admirably adapted for the growth of that grain. It yields a flour darker than wheat-flour. It is almost equal in nutritive value to wheaten bread. Barley and oats, which, when used as bread, are generally made into cakes or bannocks, possess also a composition not unlike wheat. Indian corn, which thrives luxuriantly on the American soil, and is largely used there for bread, as also to a considerable extent in the Old World, is little different from wheat in the proportion of its ingredients. Rice is occasionally employed in making bread, but it is not nearly so nutritious as wheat.

But although, with the exception of rice, the various kinds of grain do not sensibly differ in the amount of nutritious matter contained in the meal, yet there is a great difference as to the quality of yielding a light, spongy bread. In this respect the flour of wheat excels all others. This quality seems to depend upon the mechanical structure of the gluten of wheat, which gives a glutinous, sticky consistency to the dough, rendering it impervious to the carbonic acid gas formed in it during the fermentation, so that the gas thus imprisoned swells it up. The meal of other grains forms a more granular and less tenacious dough, which allows the gas to escape with more or less ease as it is formed. It is thus impossible to make a light spongy loaf of oatmeal, however finely it might be ground. In the case of whole-meal bread, or brown bread, the rough, hard particles of the bran interfere with the ordinary tenacious quality of wheaten flour, and make the dough slightly porous, so that much of the gas escapes, and thus this kind of bread is never so much raised as bread of fine flour.

Instead of raising the dough by the action of yeast, which decomposes a part of the flour and causes the loss of about 2 per cent., bicarbonate of soda and hydrochloric acid, or bicarbonate of soda and tartaric acid, are sometimes employed. The proportions by this process are 4 lb. of flour intimately mixed with 320 grains of bicarbonate of soda; to this is added a mixture of 35 ounces of water and 6½ fluid drachms of hydrochloric acid, sp. gr. 1.16, or 320 grains of bicarbonate, and 160 grains of tartaric acid, and the whole is kneaded and placed in the oven. When the mixture is made, the acid acts on the bicarbonate of soda, forming common salt, which is left in the dough, and carbonic acid is liberated at every point, and communicates a spongy texture to the mass. This process is chiefly used in making *whole-meal bread*, as the usual fermentation process would cause too much change in the bran, and produce a bread liable

to sour by secondary fermentation. It is also employed in making 'fancy' and 'small bread.' Sesquicarbonate of ammonia is employed to some extent in the preparation of rusks, ginger-bread, and other light fancy bread; when heated, it entirely passes into gas, and thus yields a very spongy mass. *Short-bread* is prepared from flour with which butter has been incorporated.

Brown, Composition, or Whole-flour Bread is made from the ground but undressed wheat, and therefore contains the bran as well as the flour. Some years ago it was suggested that as the bran contained more nitrogenous matter than the flour, the whole meal must be more nutritious than the finer flour alone. But that opinion is now considerably modified. The great argument in favour of the use of whole-meal bread is that it contains more nitrogen than white bread. This is perfectly true, but as was pointed out by Wigner, the nitrogen of cereals exists in two forms—viz. the coagulable and the non-coagulable albuminoids, the former being those available for the purposes of nutrition, whilst the latter are almost useless for the purposes of food, consisting of alkaloids and salts of nitrogen. The fine portion of the flour was found by him to contain the nitrogen in the first condition, whilst the bran contained the comparatively useless form of nitrogen. A strong argument against the use of whole-meal bread is that the gritty particles which are present in the bran cause an unnatural irritation in the alimentary canal, and lead to a quicker evacuation of the but partially digested and absorbed food. This explains why brown bread possesses laxative properties, and why labourers fed on it consider that it makes them hungry soon again; they feel that it does not last in the stomach, and consequently think it has little nourishment in it.

The Act of 1836 prescribes that bread, except French rolls and fancy bread, must be sold by weight only; and the Factory and Workshops Act of 1878 regulates the condition of bakehouses. See also BISCUITS, CEREALS, COOKERY, DIET. DIGESTION, FOOD, MILL, WHEAT.

AERATED BREAD is prepared by a process patented by Dr Daughlish in March 1859, and was at one time very popular, but its use is now almost exclusively confined to London and district. The process consists in placing the flour in a strong inclosed iron box, and moistening it with carbonic acid water, prepared as stated under *Aerated Waters* (q.v.). The dough is then worked up by machinery for ten minutes or so inside the box, from which it is dropped into moulds, which form it into loaves. It is then placed in an oven, when the carbonic acid, previously introduced with the water within the dough, expands, and forms a light palatable bread. The advantages claimed for this method of working bread are: (1) There is a saving of the whole of the waste caused by fermentation, which admits of more bread being made out of a sack of flour than by the old process; (2) The process, instead of occupying eight or ten hours, is completed in half an hour; (3) The cost of machinery and gas is less than that of yeast used in the old process; (4) The dough requires no handling to knead it and form it into loaves; (5) The bread is absolutely pure—it is simply flour, water, and salt. Not having undergone the process of fermentation, however, it has not the peculiar sweet flavour that we are accustomed to in ordinary bread, and the palate soon tires of the somewhat vapid taste.

GLUTEN BREAD is a bread prepared in such a way that it contains no starch or sugar, so as to be suitable as a food for diabetic patients. The flour is made into a stiff dough with water, and

allowed to stand for a short time, usually an hour. It is then kneaded under running water so as to separate and wash away the starch. When the wash water ceases to be milky, the remaining gluten is made up into small rolls and baked.

The adulterations of bread are dealt with in the article on ADULTERATION.

Breadalbane. See CAMPBELL.

Bread-fruit Tree (*Artocarpus incisa*), a tree of the sub-order Artocarpaceae of Moraceae (q.v.), a native of the islands of the Pacific Ocean and of the Indian Archipelago, is one of the most important gifts of nature to the inhabitants of these regions, its fruit supplying the principal part of their food, and its inner bark a considerable part of their clothing, whilst its timber and its milky juice are also employed for economical purposes. The genus to which it belongs (Gr. *Artocarpus*, 'bread-fruit')

Bread-fruit (*Artocarpus incisa*).

is distinguished by having the male flowers in catkins, with a two-leaved perianth and one stamen; the female flowers naked; the fruit roundish, fleshy, and tuberculated. The bread-fruit tree is a rather slender tree, 40 to 50 feet high, and often rises almost half its height without a branch. It has large pinnatifid leaves, frequently 12 to 18 inches long, dark-green, and glossy. The fruit is generally oval, or nearly spherical, and about the size of a child's head, and 3 or 4 lb. in weight. It is a *sorosis*, a compound or aggregate fruit formed from numerous flowers on a common axis, and is covered with a roughish rind, which is marked with small square or lozenge-shaped divisions, corresponding to the separate fruitlets; it is at first green; when imperfectly ripened, brown; and when fully ripe, assumes a rich yellow hue. It is attached to the small branches of the tree by a short thick stalk, and hangs either singly or in clusters of two or three together. It contains a somewhat fibrous pulp, which, when ripe, becomes juicy and yellow, but has then a rotten taste. At an earlier stage, when the fruit is gathered for use, the pulp is white and mealy, and of a consistence resembling that of new bread. In a still less mature state, the fruit contains a tenacious white milk. The seedless variety is of course especially fleshy, but the seeds of the normal form are sometimes roasted like chestnuts or used as sources of starch. The common practice in the South Sea Islands is to cut each fruit into three or four pieces, and take out the core; then to place heated stones in the bottom of a hole dug in the earth; to cover them with green leaves, and upon this to place a layer of the fruit,

then stones, leaves, and fruit alternately, till the hole is nearly filled, when leaves and earth to the depth of several inches are spread over all. In rather more than half an hour, the bread-fruit is ready; 'the outsides are, in general, nicely browned, and the inner part presents a white or yellowish cellular pulpy substance, in appearance slightly resembling the crumb of a wheaten loaf.' It has little taste, but is frequently sweetish, and more resembles the plantain than bread made of wheat-flour. It is slightly astringent, and highly nutritious. Sometimes the inhabitants of a district join to make a prodigious oven—a pit 20 or 30 feet in circumference, the stones in which are heated by wood burned in it, and many hundred bread-fruits are thrown in, and cooked at once. Baked in this manner, bread-fruit will keep good for several weeks. Another mode of preserving it is by subjecting it in heaps to a slight degree of fermentation, and beating it into a kind of paste, which although rather sour, is much used when fresh bread-fruit cannot be obtained. There are numerous varieties of the bread-fruit tree in the South Sea Islands, and they ripen at different seasons. The tree produces two and sometimes three crops a year, in fact is bearing during eight or nine months of the year. In the West Indies and South America, into which it has also been introduced, the bread-fruit is valued as an ornamental tree, but has not come much into use as an ordinary article of food; various preparations of it, however, are reckoned delicacies.—The fibrous inner bark of young bread-fruit trees, beaten and prepared, is used for making a kind of cloth, which is much worn by the common people in the South Sea Islands, though inferior in softness and whiteness to that made from the paper mulberry (see MULBERRY, PAPER).—There exudes from the bark of the bread-fruit tree, when punctured, a thick mucilaginous fluid (*latex*), which hardens by exposure to the air, and is used, when boiled with cocoa-nut oil, for making the seams of canoes, pails, &c. water-tight, and as birdlime.—The timber is soft and light, of a rich yellow colour, and assumes, when exposed to air, the appearance of mahogany. It is used for canoes, housebuilding, furniture, and many other purposes. It is durable when not exposed to the weather. The leaves serve for wrapping articles of food, and the fallen male catkins furnish a convenient source of tinder.—The Jack Tree or Jaca (*A. integrifolia*) is a large and very thick tree, a native of the East Indies, but cultivated also in the Antilles, with large entire leaves and much larger fruits (up to 25 lb.), of which some varieties are as eatable as those of the commoner species. The mahogany-like timber is known as jacqueira-wood, and is used both in building and furniture. The sap yields a kind of dammar, and is also a source of caoutchouc. *A. hirsuta* (Malabar) yields paper from its bast.

Bread-nut, the fruit of *Brosimum alicastrum*, a tropical American artocarpaceous tree closely allied to the bread-fruit. The bread-nut tree is dioecious, with ovate-lanceolate evergreen leaves, and abounds in a tenacious gummy milk. Its leaves and young shoots are much eaten by cattle, but deleterious qualities are said to be developed in them as they become old. The fruit is a one-seeded drupe, and the kernels, boiled or roasted, form an agreeable article of food, and are eaten instead of bread. Their taste resembles that of hazel-nuts.—The *Palo de Vaca*, or Cow-tree (q.v.), is often referred to the same genus.—*B. Aubletii* yields heartwood of a rich deep mottled brown, hence called letterwood, snakewood, or leopard-wood. It is chiefly used for veneering. These two species are also tropical American.

Bread-root. See YAM and PSORALEA.

Breadth is a term used by painters and critics to indicate that artistic quality which gives concentration, repose, and harmony of effect to a picture. In a work distinguished by breadth, the individual component parts do not force themselves unduly upon the spectator, the eye is not tempted to wander aimlessly from point to point of the canvas; in such a picture we do not feel inclined to count the several bricks of the artistic structure, but we are led to admire the general proportion and total effect of the building. Breadth of effect is most commonly and readily attained by massing the shadows, and skillfully leading the eye through the half-tones to the brilliant concentration of the highest lights; and of this mode of treatment the portraits and figure-pieces of Rembrandt are typical and unsurpassable examples. The introduction of the triangular spaces of shadow, which appear so frequently in the foreground of Waterloo's etchings, and in the landscape-work of his contemporaries, is a well-known conventional and mechanical device for securing breadth of effect. Breadth, however, may—in the hands of an accomplished painter—be attained more subtly when the greater part of the canvas is kept in full sunshine and the spaces of shadow minimised (instead of the points of light, as in the practice of Rembrandt above referred to); and of this method of attaining breadth the most perfect examples that art has yet presented are the later landscapes of Turner. The term 'breadth of handling,' or 'a broad touch,' is used to express certain characteristics of manipulation, to designate the practice of a painter who works with a full brush, and aims less at minute and searching expression of detail than at truth and beauty of general tone, effect, and relation.

Bread-tree. See KAFFIR BREAD, CYCADACEÆ.

Breaking Bulk, in Scots law, signifies making use of an article supplied in bulk, or in quantity; by which act one is said to break bulk, and is, in consequence, prevented from afterwards objecting to it, and returning it to the seller. It may be necessary to apply for judicial inspection before doing this, or at least to give notice to the carrier or to the seller. See SALE OF GOODS.

Breaking Inclosures, the technical name of an old statutory offence in Scotland, which consisted of injuring plantations or breaking their inclosures. Special punishments were provided for the purpose of favouring planting and inclosing in the 17th century. This would now be punished as malicious mischief.

Breakspear. See ADRIAN.

Breakwater is a barrier intended for the protection of shipping in harbours or anchorages. It sometimes happens that, in front of a semi-circular bay, a small island is so situated as to form a natural breakwater. This is to some extent the case with the Isle of Wight, which occupies such a position as to protect Portsmouth and Southampton from the south. In many other places, however, bays and harbours are without such screens. A pier may be so placed and constructed as to serve also the purpose of a breakwater, but the term breakwater is generally confined to a structure used solely for protection, and not for berthing or traffic, and breakwaters are frequently insulated, so as to be cut off from any communication with the shore unless by water.

Plymouth Breakwater is the best known of these engineering works. The sound or harbour, being open to the south, was so much exposed to storms that it was determined to construct a breakwater across its mouth, with openings between it and the shore, on either side, for the ingress and egress of shipping. The works were commenced in 1812,

from designs from Rennie. The operations consisted in transporting large blocks of stone from a neighbouring quarry, shipping them in vessels fitted with trap-doors, and depositing them in the shape of a huge mound. The design was to carry the rubble mound to a height of 10 feet above low-water, with a width on top of 30 feet. As soon as the stones began to appear above water, a perceptible benefit resulted in the calmness of the sound during the prevalence of storms; but the structure was very roughly handled by the waves, which altered and flattened its shape. A storm in November 1824 overthrew a length of 796 yards of the finished work; after this the breakwater was raised 10 feet higher, the seaward slope made 5 to 1, and the top width 45 feet, the top and slopes paved with masonry, and the top protected with expensively dressed granite blocks, joggled together and bedded with cement. It was not until 1841 that the works were finally completed, by the deposit of more than 3,000,000 tons of stone, and the expenditure of nearly £1,500,000. The breakwater is nearly a mile long. The open channels at each end, between the breakwater and the shore, are each about half a mile wide, and their depth is respectively 40 and 22 feet at low-water. The breakwater is 400 feet wide at the base, and 45 at the top—the two sides being made very sloping for the security of the stones. The water-space protected by this breakwater comprises 1120 acres, and it is generally admitted that the money has been well spent. The breakwater requires constant repair; the sum voted in some years exceeds £2500.

Holyhead Breakwater was designed by J. M. Rendel for the purpose of converting Holyhead Bay into a harbour of refuge. It is formed of stone quarried from Holyhead Mountain, the stone being run out upon a timber staging and dropped into the sea. This mode of construction was first adopted at this work, and it permits the stone being deposited in rough weather, when it would not have been safe to use barges. The rubble reached up to the level of high-water, and has assumed a seaward slope of 1 in 12. A vertical wall, 20 feet thick, is founded in the rubble at low-water level and carried up to 40 feet above that level; the width of roadway inside is 40 feet. The breakwater shelters an outer roadstead of 400 acres, with a depth of from about 20 to 50 feet, and an inner harbour of 267 acres, with a depth of 3 to 7 fathoms. The original estimate was £1,400,000. The stone for the breakwater was obtained by enormous blasts: one of the mines contained 21,000 lb. of gunpowder, which displaced 130,000 tons of stone. On Rendel's death the completion of the work was entrusted to Sir John Hawkshaw, who completed the head, which was founded by divers at a depth of 20 feet under low-water, and carries a lighthouse rising to the height of 70 feet above high-water. The cost of the breakwater was £163, 10s. per lineal foot. The work was begun in 1847 and finished in 1873.

Portland Breakwater is of very great value, in converting into a harbour of refuge the expanse of water between the Dorsetshire coast and the Isle, or rather peninsula, of Portland. An act of parliament was obtained in 1847 authorising the works, which were begun in 1849. The breakwater, starting from the north-east point of the Isle, stretches nearly due north for more than 2 miles, with one or two intervening openings for the ingress and egress of shipping. The works are of the same engineering character as Holyhead, but were conducted more easily than those of any other great breakwater; for the Isle contains an abundance of stone easily quarried, and the

steep shores afforded facility for transporting the stones by gravity. The work, finished in 1872, is for the most part a rubble stone bank, sur-

Plan of Portland Breakwaters.

mounted by vertical walls from the low-water level; the depth is about 50 feet at low-water. The new breakwater (1894-1903) extends from the north to meet the northern end of the old one, a distance of over two miles.

Batteries mounted with heavy ordnance were erected on the breakwater.

Dover Breakwater has been chiefly useful as the French mail-packet station. There is no stone near to form a mound, as in the other breakwaters spoken of, and, in consequence, the work has been brought up in solid ashlar from the bottom by the diving-bell, with the interior formed of blocks of concrete. In 1891 a bill was passed for extending the commercial harbour, and the memorial stone was laid by the Prince of Wales in 1893. The

PLAN OF ADMIRALTY HARBOUR—DOVER 1909

work included an extension of the Admiralty Pier 580 feet in length, with another new east pier, and enclosing an area of 75 acres. Works for a further extension in the form of a National Harbour of Refuge were commenced in the beginning of 1898. These consist of a further extension of the Admiralty Pier of 2000 feet, an east arm extending 3320 feet, and a breakwater 4200 feet long, at a distance of three-quarters of a mile from the shore, to form the sheltering arm of the harbour on the south. The entrances are 740 feet and 650 feet in width,

with 40 feet depth at low-water. The area enclosed, including the commercial harbour, is 685 acres; the cost was £3,500,000, and the whole was completed in 1910. In these works the breakwaters are formed of concrete blocks built as solid structures from the foundations upwards, the blocks being bonded together. The external faces are of granite incorporated into the blocks. These latter works were designed by Messrs Coode and Matthews.

Alderney Breakwater was designed for the government by James Walker in 1847. The situation is fully exposed, and the depth of water at its extremity is 130 feet. This breakwater consists of a rubble mound, with walls above founded 12 feet under low-water. The work was completed in 1864, but has been at various times seriously damaged. The total cost of the structure was £1,327,050.

Cherbourg Breakwater is the greatest and the most costly ever constructed. About 150 years ago M. de Cessart proposed to the French government the formation of a breakwater at Cherbourg, to be commenced by the construction of a number of hollow cones formed of timber-framing, sunk in a line as close as they could be placed to each other, and then filled with stones. These cones, of which there were to be 64, each about 70 feet high, 150 feet in diameter at the base, and 60 feet at the top, were intended to form a nucleus to the stone breakwater, to prevent the stones, during its formation, being knocked about and too much spread out by the action of the waves. In 1784-88 16 cones were constructed, and 13 of them sunk; but so great was the destruction which they underwent during stormy weather that the government at length abandoned the plan, and carried on the stone breakwater without the aid of the cones. It was completed under Napoleon III. at a cost exceeding £2,500,000. The breakwater itself was finished in 1853, but since that year large fortifications have been built upon the upper works. The length is nearly 2½ miles; the breakwater is 300 feet wide at the bottom, and 31 at the top. The chief mass consists of rubble or unshaped stones, thrown down from ships; but there is a larger ratio of wrought and finished masonry than in the Plymouth Breakwater, consisting of granite blocks embedded in cement. The depth of water is about 60 feet at low-water spring-tides; and the breakwater rises to 12 feet above high-water level. The water-space included within and protected by the breakwater is about 2000 acres, but two-thirds of this has scarcely depth enough for the largest-sized ships. The relation which this breakwater bears to the vast military and naval arrangements of the place will be noticed under CHERBOURG.

Concrete Breakwaters.—The introduction of concrete made from Portland cement has in recent years greatly modified and simplified the construction of breakwaters. The cement is mixed with sand, gravel, and broken stone in various proportions according to exposure—1 of cement to 6 of other materials being a common proportion for breakwaters. Sometimes the concrete is made into large blocks on shore and deposited under low-water. On the other hand, it may be lowered down, enclosed in large bags; or it may be lowered down in boxes, with hinged bottoms, and deposited in mass on the bottom, within timber or metal casing. The Portknockie Breakwater owes its strength to being a monolith of concrete made in this way. The south breakwater of Aberdeen is formed on large blocks from the bottom up to 4 feet above low-water, and above that level of concrete in mass formed within temporary casing. The Colombo Breakwater is composed of a mound of

rubble brought up to 24 feet under low-water, and above that level of concrete blocks weighing 35 tons each set on edge. Sometimes breakwaters are made by first depositing large concrete blocks of 20 to 50

BREAKWATERS — SECTIONS

tons in weight, in *pierres perdues* style from the bottom up to a little above low-water, and then forming a monolithic mass of concrete above, such as the breakwater at St Jean de Luz. The breakwater in Peterhead Bay (part of the great harbour of refuge, begun in 1886) is somewhat in the Colombo style, and is being made by aid of convict labour. The north breakwater will be 1000 feet long when finished. The southern arm, which is completed, is about 3250 feet, and the area enclosed will be 285 acres. The largest blocks weigh 52 tons. The breakwater at Fraserburgh, begun in 1878 and finished in 1882, is constructed of Portland cement concrete; the lower portion is formed of fifty-ton bags dropped from a barge. The result at Aberdeen has not been favourable to the bag-work system for exposed situations, serious damage having been sustained by the works. The bag-work has had to be protected at some parts by large concrete blocks deposited in front of them.

Many substitutes have been proposed for solid breakwaters, such as floating breakwaters constructed of timber framework, open iron screens, &c., but none of them have been shown to be suitable for actual practice. Close timber-work, filled in with stones, is found to be quite efficacious; but on most of our coasts the timber is liable to be eaten by the marine worm, which is an almost insuperable objection to its being used under water. See HARBOUR.

Bréal, MICHEL JULES ALFRED, French comparative philologist and mythologist, born at Landau, in Rhenish Bavaria, 26th March 1832, was

professor in the Collège de France 1864–1905, and died 25th November 1915.

Bream, a popular name applied to three very different kinds of fish, but especially to the first mentioned. (1) The Fresh-water Bream (*Abramis brama*), a common little fish nearly allied to the Bleak (q.v.). It has an elongated, laterally compressed body, a short blunt snout, and long anal fins. The colour varies from silver-gray to brown. It may measure over a foot, and usually weighs between two and four pounds, though often more. The bream is frequent in north Europe, including England, the south of Scotland, and Ireland, and swims in great shoals, in quiet waters. It is shy, hardy, and prolific, and feeds on water-weeds, small animals, and organic matter in the mud. At the breeding-time the males become adorned with numerous whitish knobs, which become amber-coloured; as many as four are said to follow the spawning female. The flesh is eaten, especially on the Continent. The White Bream (*Blicca bjoernka*) occurs in England in eastward rivers from Yorkshire to Suffolk. The flesh is of poor quality.

(2) Quite distinct from these is the large family of Sea-breams or *Sparidae*, in the Acanthopterygii division of bony fishes. They have compressed oblong bodies, one dorsal fin, with approximately equal soft and spinous portions, with the lower rays of the pectorals usually branched, with thoracic ventrals. They are especially characterised, however, by the nature of their dentition. Anterior cutting teeth, or lateral molars, or both, sometimes plus anterior conical canines, are present, and the palate is usually toothless. The family is a large one, with 30 genera and about 160 species, occurring abundantly along the coasts of tropical and temperate seas. They feed on flesh or algae, and are for the most part fit for eating. The solitary Black Sea-bream or Old Wife (*Cantharus lineatus*), the Common Sea-bream (*Pagellus centrodontus*), caught in great numbers with the seine net, the Mediterranean Gilthead (*Chrysophrys aurata*), and many others, occur on southern British coasts. The Australian Black Bream is *Chrysophrys australis*; the Red Bream is merely a

Common Sea-bream (*Pagellus centrodontus*).

young Schnapper (q.v.). (3) *Bramarai* (see BRAMA), of the mackerel family, is also called Bream.

Breastplate, in ancient armour, was a plate of iron, steel, or other metal, so fastened as to protect the chest of the wearer. The backplate protected him from attack from behind. The two together form what is now called the *cuirass*, worn by the *cuirassiers* of European armies, and by the household cavalry (Life-guards and Horse-guards) in England. See ARMOUR.

Breasts, or mammary glands, are the organs which secrete milk for the nourishment of the young in the Mammalia, and from the presence of which that class of animals takes its name. In the human subject they are two in number, situated on the front of the chest. In very exceptional cases additional glands are found, sometimes in remote situations. In children they are small and rudi-

mentary, but about the age of puberty they enlarge. In boys this enlargement, if it occurs, passes off after a few days, and the breasts remain rudimentary during the rest of life; but in girls it leads to the full development of the organ. Over the centre of the gland there is a circular patch of skin, thinner and darker than the rest (the *areola*); and from it rises a small conical projection (the *nipple*). On the apex of the nipple the *milk-ducts* (15 to 20 in number) open by separate orifices. Each of these ducts passes outwards to one division or *lobe* of the breast, dilating beyond the nipple into a *sinus*, and

Breast, showing the lower half dissected, during the period of lactation (from Luschka).

then branching repeatedly to terminate in the *lobules*, or clusters of small rounded vesicles in which the milk is secreted. The lobules and lobes are bound together by connective tissue, and well packed in fat, which increases sometimes to an enormous extent the apparent size of the organ.

In the adult female the breasts swell a little at each monthly period. During pregnancy considerable enlargement takes place, and shortly after the birth of the child the milk begins to be freely secreted.

DISEASES OF THE BREAST are of frequent occurrence in women, probably on account of the great changes in activity and blood-supply to which the organ is subject.

Fissures of Nipple.—During suckling the delicate skin of the nipple often becomes abraded. The ulcers or fissures thus formed are usually very painful, so much so it may be as to render nursing impossible, and frequently lead to abscess of the breast. Their formation may usually be prevented by applying to the nipple several times daily a spirit lotion—e.g. diluted eau-de-Cologne or brandy—or an astringent—e.g. glycerine of tannic acid—both before and after nursing is begun, and by scrupulous attention to cleanliness. When they have formed, similar measures may be used; or oxide of zinc, starch, or some other drying powder, frequently applied. If severe or persistent, the use of lunar caustic may be necessary.

Acute Inflammation and Abscess.—Acute inflammation of a part of the breast or of the adjacent tissues frequently occurs during nursing, rarely at other times. In its treatment, besides measures generally useful in inflammation, the free application of belladonna in the form of plasters or liniment is of special value; and care must be taken that the milk is not allowed unduly to accumulate in the organ. When abscesses result, they should be opened with antiseptic precautions; but they are often very tedious and intractable.

Chronic Inflammation of the whole or a part of

the breast sometimes occurs, and may closely resemble a true tumour. It may disappear under the prolonged application of warmth and moisture, or other remedies which favour absorption, or may end in abscess.

Tumours.—The breast may be the seat of almost any of the numerous forms of Tumour (q.v.) met with in the body. Far the most common varieties in this situation, however, are *glandular tumours* and *hard cancer*. Glandular tumours (adenoma) vary much in size, form, and consistence, but present in their intimate structure more or less resemblance to the normal structure of the breast, and are not dangerous to life. Their removal may be necessary on account of the pain or inconvenience they cause the patient. Cancer (q.v.), on the other hand, is all but invariably fatal if left alone, and the whole gland affected with it should be removed at once as soon as the nature of the case is recognised. Unfortunately, however, the disease frequently returns. It is most important that any lump in the breast, not obviously inflammatory, should at once be shown to a medical man, though in some cases it may be hardly possible, even for the most practised, to decide at once its nature. Here it must suffice to say that cancer of the breast very rarely begins before the age of thirty; in a woman younger than this, therefore, a tumour is not likely to be of a serious nature.

The male breast is occasionally, but very rarely, the seat of disease.

Breastwork, in Fortification, is a hastily constructed earthwork of sufficient height to protect men standing on the natural surface of the ground, and firing over it without requiring a 'banquette' to stand upon, as would be the case with the more carefully constructed work called a 'parapet.' The ditch in front, from which the earth is taken to form the breastwork, affords a slight additional obstacle to the attack. The inner surface of a breastwork is revetted (that is, faced with sods, timber, hurdles, &c.), in order that it may stand at a steep slope, thus improving the cover it gives by enabling the defenders to get close up to it. In this respect it differs from the still simpler work called an *Epaulement*.

Breath and Breathing. See RESPIRATION.

Breath, OFFENSIVE, may depend upon some cause limited to the mouth or nose, or it may arise from diseased conditions of the respiratory or digestive apparatus. If, from want of proper attention, the teeth have collected a quantity of putrescent particles around them, they must be well scrubbed with a brush and tepid water, with some powdered carbonate of magnesia mixed with it. A wash composed of a teaspoonful of tincture of myrrh or of Condyl's fluid in a pint of water is also very useful. Occasionally, the secretion from the Tonsils (q.v.) is very offensive; and then a solution of iodine 5 grains, potassium iodide 10 grains, and peppermint oil 3 drops to an ounce of glycerine should be applied to them every morning with a camel-hair brush. Solutions of soda in water are also very useful. Should the fetid smell arise from a portion of dead bone, the latter must be removed when it becomes loose. Inhalation of steam from hot water into which some creosote has been dropped is much recommended for cases in which the cause resides in the nose and respiratory passages. When, however, it is caused by digestive derangements, the treatment should consist in purging to empty the intestinal canal, followed by soda to correct acidity, and tonics, of which the bitter infusions and tinctures, and the dilute mineral acids, are among the best.

Medical treatment is of little use to correct the foul odour which rises from the stomach of the

habitual drunkard, or from the victim of gangrene or abscess in the lungs. See also OZENA.

Breccia, a term adopted from the Italian to designate a mass composed of angular fragments of rocks of the same or different kinds, cemented together by an enveloping paste, as, for example, by infiltrated oxide of iron or carbonate of lime. Bones and fragments of bones cemented together by calcareous matter often occur upon the floors of caves in limestone; these are termed *bone-breccia*.

Brechin, a town of Forfarshire, on the left bank of the South Esk, $8\frac{1}{2}$ miles W. of Montrose. Pop. 8000. With Montrose, Arbroath, Forfar, and Bervie, it returns one member to parliament. Linen and paper are the leading manufactures; bleaching, distilling, and brewing being also carried on. David I. founded a bishopric here about 1150. Part of the cathedral, late First and Second Pointed in style, is now the parish church, at whose south-west angle rises a Round Tower (q.v.), similar to the Irish ones, and to the one at Abernethy, the only other example in Scotland, unless the tower of the ancient church of Egilshay in Orkney be reckoned a third. Dating probably from about 983, it is surmounted by a 15th-century conical roof of 25 feet. Brechin Castle, the ancient seat of the Maules, now represented by the Earls of Dalhousie, was taken by Edward I. in 1303 after a twenty days' siege. The town itself was burned by Montrose in 1645; and near it Huntly defeated the rebellious Crawfords in 1452. Dr Thomas Guthrie was a native.

Brechou, one of the Channel Islands, W. of Sark; area, 74 acres.

Breckinridge, JOHN CABELL, vice-president of the United States, was born 21st January 1821, near Lexington, Kentucky, where he practised law until 1847, when he was chosen major of a volunteer regiment for the Mexican war. He sat in congress 1851-55, and in 1856 was elected vice-president, with Buchanan as president. In 1860 he was the pro-slavery candidate for the presidency, but was defeated by Lincoln. A United States senator from March to December 1861, he then entered the Confederate army, was appointed a major-general in 1862, and held some important commands during the civil war. He was secretary of war in Jefferson Davis's cabinet at the close of the struggle, and escaped to Europe, but returned in 1868. He died at Lexington, 17th May 1875.

Brecknock, or BRECON, the capital of Brecknockshire, is situated in an open valley in the middle of the county, at the confluence of the Usk and Honddu, 183 miles W. by N. of London by rail, and 40 NE. of Swansea. It lies in the midst of fine mountain scenery, and has beautiful public walks, the triple-peaked Brecon Beacons (2910 feet) rising to the south. From 1536 to 1885 Brecon returned one member to parliament. Flannels, coarse woollens, and hats are manufactured. Population, about 6000. Bernard de Newmarch founded the town, and built a castle there in 1094. Henry VIII. in 1541 converted a Dominican friary into a college, which was rebuilt in 1864; the priory, now the parish church, was restored by Sir Gilbert Scott in 1862. The county-hall was built in 1843. Miss Siddons and Charles Kemble were natives.

Brecknockshire, or BRECON, an inland county of South Wales, to the south of Radnorshire, from which it is separated by the Wye. The maximum length is 39 miles; its breadth ranges between $11\frac{1}{2}$ and 30 miles; and its area is 733 sq. m., of which hardly half is cultivated. Brecknockshire is one of the most mountainous counties in South Wales, and has deep, beautiful, and fertile valleys. Two principal mountain-chains, the highest in South Wales, culminating in the

Brecon Beacons at a height of 2910 feet, intersect the county in the north and south, and occupy, with their offshoots, a great part of the surface. The Old Red Sandstone occupies the south and middle of the county, and Silurian rocks the north. The chief rivers are the Wye and Usk; and Llangorse Lake covers nearly 1800 acres. The climate is moist but healthy among the mountains, and in the valleys comparatively mild. Birmingham, Cardiff, Swansea, and Merthyr-Tydfil derive most of their water-supply from Brecknockshire. Agriculture, though still defective, especially in the higher districts, has been greatly improved by the Brecknockshire Agricultural Society, instituted in 1775. The chief crops are oats and barley, but wheat is also grown in Talgarth and Crickhowell, the most fertile districts of the county. The small native cattle are reared in the hills, while in the lowlands the Hereford breed predominates. The mineral produce is small, consisting of iron, especially along the south border; coal and limestone are also found in the south and west. The Brecon Canal connects the county with the Bristol Channel, and many railways have been constructed throughout the county. There are small factories of woollens and worsted hosiery; also important iron-works, but the ore is chiefly obtained from adjoining counties. Brecknockshire, in combination (since 1918) with Radnor, returns one member to parliament. Pop. (1801) 32,325; (1871) 61,627; (1911) 59,287; (1921) 61,257. The chief towns are Brecon (the county town), Brynmawr, Builth, Crickhowell, Hay, and Llanwtydd. There are many remains of British and Roman camps, Roman roads, cairns, menhirs, Ogham inscriptions, mounds, and castles throughout the county. Brecknockshire formed part of the territory of the Silures, who bravely withstood the Romans. The Normans, under Bernard de Newmarch, wrested the county from the Welsh princes in 1092. Llewelyn, the last British prince of Wales, was killed at Llanafanfarch, near Builth, in 1282, and by his fall the native mountain-chiefs were entirely subdued. Welsh is still the language of the middle-class and the peasantry. See Jones's *History of Brecknockshire* (1805-9; new ed. 1898).

Breda, a town of North Brabant, Holland, at the confluence of the navigable Mark and Aa, 52 miles ENE. of Flushing, and 30 NNE. of Antwerp. It formerly possessed the means of laying the surrounding country under water in the event of an attack, but the importance of the town as a military position has passed away, and in 1876 the fortifications were removed. Its Gothic cathedral (1510) has an octagonal steeple 311 feet high, and several interesting monuments; whilst the castle (1350) received its present shape from William III. (1696), and in 1828 was converted into a military academy. There are manufactures of carpets, linen, hats, soap, furniture, &c., and dye-works, breweries, and rope-walks. Pop. 30,000. Breda is celebrated as the place where, in 1566, the protest of the Dutch nobles, known as the 'Compromise of Breda,' against the measures of Philip II. of Spain in the Netherlands, was presented and rejected. The 'Declaration of Breda' (April 1660) was Charles II.'s manifesto prior to the Restoration; whilst by the 'Treaty of Breda' (1667) between England, France, Holland, and Denmark, England got St Christopher, Antigua, and Montserrat, and France Acadia. Breda has suffered numerous sieges, having been captured by the Spaniards (1581), by the Dutch under Maurice of Orange (1590), by Spinola (1625), again by the Dutch (1632), and twice by the French (1793-95), who were finally driven out in 1813.

Brederode, HENRY, COUNT OF, born in

Brussels in December 1531, was a leader of the disaffected nobility in the struggle against Spain. He drew up the 'Compromise' of 1586, and headed the deputation to whom the name Gueux (q.v.) was first applied. He was active in organising the fraternity, but the failure of an attempt, in the following year, to raise an armed revolt in Amsterdam obliged him to flee to Germany, where he died at Recklinghausen, 24th August 1568.

Bree, MATTHIAS IGNATIUS VAN, a Flemish painter, was born at Antwerp in 1773, and in 1797 gained the *prix de Rome* by his 'Death of Cato.' In 1804 he returned to Antwerp, where he became director of the Academy of Fine Arts, and died 15th December 1839. His chief works are the 'Entrance of Napoleon into Antwerp,' the 'Death of Rubens,' in the Antwerp Museum, and the 'Patriotism of the Burgomaster at the Siege of Leyden, 1576,' in the town-house of Leyden.—His brother, PHILIPP JACOB VAN BREE (1786–1871), also acquired some reputation as an historical painter.

Breeches, Trousers, and Hose are the most general terms for a garment of many forms, which in most of Europe has been worn mainly by males, but among some northern and eastern peoples by women also. *Hose* is still familiar from the phrase 'doublet and hose' (signifying male attire), and from such compounds as trunk-hose (a kind of breeches reaching to mid-thigh, puffed and slashed and otherwise ornamented, which in the 16th century was worn with long stockings). Originally meaning perhaps a stocking, the word hose came to be applied to combined breeches and stockings, and when these were separated again (as in trunk-hose) it could be used of either 'overstocks' or 'netherstocks,' but in course of time came in English to be restricted to the latter, while in German it followed the opposite course, and has become the ordinary word for trousers. *Breeches* and *trousers* stand broadly for two types of garment not clearly or consistently distinguished, breeches being generally used of such as come short of the knee or reach only a little way below it, trousers of the longer kinds. Though the predominance of the latter fashion has determined that the exotic word trousers should now be the more familiar, yet in symbolical use—betokening maleness or domination, or the change from nudity to the wearing of clothes—where the distinction is irrelevant, and the expression often traditional, the native English word still prevails. According to Wyclif, Adam and Eve 'maden hem brechis,' and the Geneva Bible of 1560 takes its name of Breeches Bible from its use of the same word. One might cite Wyntoun on Noah's household: 'among thame al was not ane breke;' or David Lyndesay: 'made them brekis of levis grene;' but to this day in the Scottish dialect breeks (the northern form of breeches) retains its general sense. The word is a double plural. In Old English the singular must have been *brēc*, with plural *brēc* (cf. *tōth*, *tēth*, *gós*, *gés*; 'tooth,' 'teeth,' 'goose,' 'geese'). The original plural came to be regarded as a singular, and a new plural was formed from it. *Trews* or *trouse*, on the other hand, now felt to be a plural, was originally a singular, derived apparently not from French *trousse*, but from Irish *triubhas* (*New English Dictionary*). Its plural *trouses* survives only as a vulgarism, except in the disguised form *trousers*. *Hose* likewise is felt as a plural—'On ilka leg a ho had he' (James Hogg).

Trousers were to the Greeks and to the Romans (of republican times) a mark of barbarism, worn by most of their neighbours to north and east—Celts, Germans, Dacians, Sarmatians, Phrygians,

Parthians, Persians, and others. Gallia Narbonensis was distinguished as *Gallia braccata* (breeched Gaul, from a Celtic word apparently cognate with the Germanic) from *Gallia togata* (Cisalpine Gaul), which had abandoned the garb of old Gaul for the Roman toga. The close-fitting hose of the middle ages call for no particular notice, but from the trunk-hose days the overstock takes many forms. One may note the baggy Dutch slop, the fantastic pluderhose of the lanzknechts, the loose, wide petticoat-breeches of Charles II., the culottes or knee-breeches which the French Revolutionists rejected in favour of the tight pantaloons—a Venetian garment reaching the ankle, whose name survives in the American and vulgar *pants*.

Breech-loading is the introduction of the charge into a firearm at the breech instead of at the muzzle. A description of the systems used in the case of rifles will be found in the article with that heading, and in this one the systems used with cannon and sporting guns will only be dealt with.

Efforts to provide a practical system of breech-loading are almost contemporaneous with the introduction of cannon, and some account of these will be found in the article on Firearms, and it will be seen that in early days breech-loading was the rule rather than the exception; but with the improvements in gunpowder and the desire to obtain greater ranges, the attendant rise in pressures rendered so intolerable the escape of gas round the imperfectly machined spigot and faucet joint secured by a wedge that we hear nothing of breech-loading in heavy guns after about 1550, and though the practice lingered on in the small 1 pr. and 2-pr. guns, it dropped entirely out of use in the 17th century, and there is no record of any practical use of it for cannon until the middle of the 19th century, when the adoption of rifling in small arms and the successful introduction of breech-loading in the 'Needle-gun' reopened the question, while the immense improvements in methods of manufacture rendered a solution of the problem of successful 'obturation' (gas-sealing) more feasible.

The first fairly satisfactory system was proposed by Captain Cavalli, an officer of the artillery of Piedmont, in 1845, and was first tried in Sweden. Guns loading on this system were used at the siege of Gaeta in 1860. It is shown in figs. 1, 2, 3, and 4. A is a wedge; B is a copper split-ring (figs. 1 and 4); C a saucer-shaped disc of iron fitting inside (B) and against the face of the wedge (figs. 1 and 3). On firing, the circumference of the saucer expanded against the walls of the chamber of the gun, as also did the copper ring (B). The difficulty with such an action would be the liability of jamming of the wedge after firing, while the danger of its being blown

out, since it is only secured by friction, would also be considerable. Further, the working would be slow, as the disc (C) had to be removed and introduced separately between rounds by means of the handle (D, fig 2), which was screwed into the hole shown in its rear face. The system was tried in England in 1850, but was unfavourably reported upon. It has, however, some of the essential features of the Krupp wedge mechanism described hereafter.

The next system was that of Baron Wahrendorf,

a Swede, which was actually adopted by Prussia for some of her guns in 1860. It appears in figs. 5 and 6. A (fig. 5) is the cup-shaped obturator, forming one piece with the ring (B) and rod (C), the latter terminating in the screw-handle with washer (D). The obturator with its ring and rod are borne by a carrier (E) attached to the rear end of the gun by the hinge (F). G (fig. 6) is an iron cylindrical block capable of passing through the ring (B). When the breech is to be closed, the obturator is pushed into the gun as far as it will

Fig. 5.

Fig. 6.

go, the block (G) is pushed through the hole (B) into its seating in the gun, and the handle (D) is screwed up tight, which has the effect of making the obturator (A) fit firmly against the block (G). The fit between the obturator and the walls of the chamber is a good one, and the gas-escape is sealed by the expansion of the cup. To open the breech, the handle (D) is unscrewed, the block (G) withdrawn, and the obturator pulled through the carrier (E) until only the obturator head (A) rests in it; the carrier with obturator in it is then swung open on the hinge (F). The obturation of this system was not perfect, and had to be supplemented by a cup-shaped wad of compressed paper on the rear of the cartridge.

The Krupp breech mechanism has undergone many improvements. In its earliest form it was somewhat similar to the Cavalli, except that there was not a separate obturating arrangement, and that provision was made for easy extraction of the wedge by means of a lever permanently attached to it, and for the prevention of the possibility of the wedge being blown out by the use of a locking-bolt. Fig. 7 shows one

Fig. 7.—Section of Krupp Breech.

of the later forms for a field-gun. The rear face of this wedge is rounded, and when the wedge is pushed home the final locking, which also causes a slight forward movement, is performed by the handle (A) working the screw (B). The latter gears over a portion of its thread into the body of the gun. A stop prevents the block, when withdrawn to allow of loading, from being pulled right out of the gun. In heavy

guns the withdrawal and insertion is performed by a screw with a very quick pitch. Obturation is effected by a Broadwell expanding ring, which is seated, as shown, in a recess at the end of the bore. The weak feature of the Krupp system is that with high gas pressures really efficient obturation can only be obtained by using a brass cartridge-

case, and such a case is employed in all modern Krupp guns up to the very largest, which of course greatly adds to the expense and weight of the cartridge. For the smaller quick-firing guns (see CANNON), however, the Krupp system is very well suited.

The Armstrong system, adopted for a few years by Great Britain, from 1859 (see CANNON), is shown in fig. 8. The 'vent-piece' (a) is held in its place by the hollow 'breech-screw' (c) through which the gun is loaded, the lever (b) being used to

Fig. 8.—Armstrong Breech.

screw it up. This lever, it will be noticed, swings loose on the end of the screw, being kept in place by two pins travelling in the groove shown. Projecting into its path is the lug (d), which is attached to the screw. Consequently, not only can the lever be used for screwing up, but by drawing it back a sharp blow can be given against the lug (d) to perform the final tightening. The system, which did fairly in small guns, is very cumbersome when a heavy vent-piece had to be lifted out after every round. As a result, an arrangement for side opening was introduced, by which the vent-piece slid on to a tray, but at this period breech-loading was temporarily abandoned for muzzle-loading.

The breech-loading system, adopted by Great Britain in 1882 and at present in use, is a French invention, and dates from 1866, when France adopted the *interrupted screw*. This consists (see figs. 9 and 10) of a solid steel block, furnished with

Fig. 9.—Elevation of Breech (open).

a screw-thread of the requisite pitch and strength, fitting into a similar female screw in the gun. The surface of the block is divided longitudinally into six or eight equal parts, and the screw-thread is 'interrupted'—i.e. planed away from alternate portions (see A, fig. 9). In the gun the parts of the thread corresponding with the smooth portions on the block are left intact, and those between them slotted away. Consequently, when the threaded and slotted parts on the block are brought opposite to the slotted and threaded parts in the gun, the block can be pushed right home into the gun, and then, by a turn through one-sixth or one-eighth of a circle (according to the

number of interruptions), the two can be locked together. When unlocked, the screw is pulled through the carrier (B), which is hinged to the gun, and then swung clear of the breech. In fig. 9 the screw has been only partially swung clear. While the screw is being pulled through the carrier, and until it is sufficiently withdrawn, the carrier is held against the breech by the catch (C).

The obturation in use is that invented by Colonel De Bange, and adopted by the French army about 1878. It consists (see fig. 10) of a *pad* (A) made of an annular canvas bag strengthened by wire woven into the fabric, filled with asbestos

worked up with mutton fat, and faced with protecting discs of steel in front and in rear. The bag and discs are threaded on the stalk of the mushroom head (B), and lie between it and the face of the breech-screw (C). The stalk of the mushroom is secured in the breech-slide-box (D).

When the gun fires the gases press on the face of the mushroom head and compress the obturator, causing it to expand sideways and press against the walls of the chamber, and so prevent escape of gas. This it does in an extraordinarily efficient manner, whether in the heaviest or lightest guns. There are many modifications of the interrupted screw system, and in heavy guns the turning of the breech-screw is performed by hydraulic or other power, but the root principle is the same in all.

In all modern guns the arrangement for firing the charge is by a hole through the breech-screw or wedge, in the mouth of which is inserted and held the *tube* (see CARTRIDGE), by which the cartridge is fired, either by percussion or electrically by a suitable *lock*. In fig. 10 the tube chamber (E) and channel (F) are shown in the stalk and head of the mushroom; and on the rear face of the breech-screw there is a percussion lock (G). Suitable arrangements are provided in all modern mechanisms whereby the gun is prevented from being fired before the breech is properly closed.

If, as in quick-firing guns, a brass cartridge-case be used, obturators, as described above, are not required, but, on the other hand, arrangements for extraction are needed, as in Rifles (q.v.).

Breech-loading Sporting Guns are made on a totally different principle, called the drop-down action. Nearly every maker has a patent for different details, but almost all are founded on the Lefauchaux action, invented in 1825. This consists of a piece of steel called the 'lump,' securely fastened to the under-side of the breech end of the barrels, and about 2 or 2½ inches long; the fore end of this lump is hinged by means of a pin to the corresponding part of the breech-piece (d, e, f, fig. 11) at d, and on this hinge the barrels are moved in opening and shutting the breech. The lump is, in most guns, cut into two divisions, c, which fit into slots in the breech-piece, and both parts have notches, into which an ingenious arrangement, called, from the inventor, a 'Purdey' bolt, snaps when shut. An additional grip to add solidity is also generally provided in various forms of an extension of the top rib, b. The modern breech-

loading sporting gun is generally made hammerless—i.e. without outside hammers, but the locks, which are let into slots in the breech-piece, are usually made, more or less, on the old principle. A main-spring, on the pull of the trigger, explodes the cap in the rear end of the cartridge by means of a hammer, either acting directly through a hole in the breech (as in the Anson and Deeley lock), or by means of a detached rod inserted in the hole. Fig. 11 represents one of the many first-class breech-actions, Greener's self-acting ejector gun. A movement of the top lever, a, to the right, simultaneously slides the cross bolt from the hole in the extension top rib, b, withdraws the double Purdey bolt from the lump, and the barrels tilt over. Swivels attached to either side of the rear end of the lump cock the hammers ready for firing again; a lever at the same time ejects the used cartridge-case. The figure shows the gun as opened after firing the right barrel, from which the cartridge-case, g, is being ejected. When the breech is closed, all the bolts snap into their places. There is a safety arrangement on the side of the gun, acting on the trigger, and another automatically obstructing the fall of the hammer, which prevent

Fig. 11.—Greener's Self-acting Ejector Gun.

the gun being accidentally discharged. Double-barrelled sporting rifles also have drop-down actions, but for single barrels the bolt action, as in military weapons, is now usually employed (see RIFLE). See GUN; also J. H. Walsh's ('Stonehenge') *Modern Sportsmen's Gun and Rifle* (1882-84); W. W. Greener's *Gun and its Development* (1881), and his *Modern Shot Guns* (1888).

Breed, a distinctive group of animals which has been evolved, under human control or selection, out of a domesticated 'race,' or, in rare cases, out of a wild species. Thus we speak of the Aberdeen-Angus breed of cattle, the Clydesdale breed of horses, the Cheviot breed of sheep, the Skye terrier breed of dogs, the fantail breed of pigeons; and there is no reason why the term should not be applied to cultivated plants, for the idea implied is simply that man has interfered with the natural possibilities of pairing or mating. For practical purposes 'breeds' and 'sub-breeds' are the results of the analysis or splitting-up of a domesticated 'race' (arising from a wild species or from several wild species), but the experimental zoologist may produce 'breeds' of beetles and the like which no one would dream of calling domesticated. Darwin distinguished between 'artificial breeds' and 'natural breeds,' but the term 'natural breed' is a contradiction in terms; it simply denotes a variety or sub-species arising in natural conditions.

Origin of Breeds.—The origin of domesticated races is wrapped in obscurity. The process had not begun in the early Stone Age, and even at the

beginning of the Bronze Age it had not progressed far. Sometimes the domesticated forms seem to have been derived from a single wild species—e.g. poultry from the Indian jungle fowl (*Gallus bankiva*)—and sometimes from several wild species, as in the case of horses. In a general way it may be said that breeds have arisen from a domesticated race by germinal or congenital variations which man made the subject of selection, pairing similar variants together, preventing random crossing, eliminating undesirable 'weeds,' and so on. But beyond this, there is still very little that is certain as to the origin of any breed. A few propositions may be stated. (a) The old idea that a breed may arise by the transmission of the results of modifications impressed upon individuals is not at present supported by convincing evidence. (b) There are some experimental facts which suggest that long-continued environmental and nurlural conditions may stimulate the germ-cells and induce germinal variations. (c) There is evidence that some breeds have arisen from crosses or hybrids. Thus the Suffolk breed of sheep is believed to have arisen from a cross between the hornless Southdown breed and the black-faced horned Norfolk breed. (d) A breed may arise by the dropping out of some ancestral character, such as horns or a tail, and there are several opportunities in the history of the germ-cells which admit of the possibility of some loss of constituent items in the hereditary equipment. (e) A breed may arise from a mutation or discontinuous variation which seems to be positively new, but the conditions of these new departures are unknown. Variability or mutability has to be accepted as a fact of life. Some of the novelties that have arisen are more or less abnormal or pathological, such as mawchamp sheep, pug-dogs, waltzing mice, and tumbler pigeons; in some cases they could not have survived in nature. Thus Darwin refers to hairless and almost toothless dogs, and to Polish fowls with their vision impeded by their great top-knots. A very striking case is that of some very short-faced pigeons whose unhatched young cannot reach and break the shell, and would die inside the egg if man did not come to their aid.

As Darwin showed in his *Variation of Plants and Animals under Domestication*, the characters of breeds and sub-breeds may have to do with any part or quality of the organism—size, shape, proportions, colour, the skin and its outgrowths, the muscles, the connective tissue, the skeleton, the nervous system, the alimentary canal, and so on, besides hardness, age of maturation, reproductivity, tendency to fatten, docility, and so on. The varieties of domestic animals that are seen at shows of different kinds illustrate the range of man's breeding experiments, but it should be carefully noticed that man can only operate on the variations which occur. He can eliminate or foster, he can combine excellencies, he can breed out an undesirable quality or graft on one that pleases him, but he cannot in any way create. In spite of popular impressions, it is variation that leads; the breeder can only follow. Another misapprehension may be corrected, namely this, that a breed which is uniformly treated in a particular way—e.g. as regards nutrition and exercise—may exhibit features which are not really part of the heritable constitution, being modifications impressed on successive generations of individuals.

Practical Breeding.—If a profitable variation crops up and survives, the breeder will seek to multiply the variant. If there are several similar individuals he will breed them together, and this close inbreeding may strengthen the new character. If he has to pair his novelty with a member of the original stock, the hybrid progeny may all take after the novelty (the new feature in such cases being called a dominant Mendelian character), and

subsequent inbreeding of the hybrids may yield a definite proportion of progeny of the novelty type. Thus a new breed may be established. When the breeder pairs his novelty with a member of the original stock, the result may be progeny all resembling the original stock. But even then he need not at once conclude that the desired new character has disappeared, for, if these hybrids all resembling the parent stock be inbred, their progeny may show a small proportion of the novelty type (the new feature in such cases being called a recessive Mendelian character). It may be, however, that the offspring of two similar new variants paired together are all like the original stock, and that the result of inbreeding them yields nothing else. The same may be true when the new variant is paired with the original stock. Then all that one can say is that the new variation has disappeared as mysteriously as it came. In some cases it is possible that pairing the variant with some other variant may result in the rehabilitation of (or reversion to) an ancestral type from which both have been derived. In other cases the result of pairing the new variation with the original stock may be a blend of the old qualities and the new. There remains considerable validity in the old principles of breeding—e.g. that breeding in-and-in makes a stock stable, that undesirable types should be persistently eliminated, that the best (relatively to a given end) should be paired with the best, that good stock should not be endangered by admixture with poor stock; but the theory of breeding has been fundamentally altered by the discovery of Mendelian inheritance, which must be taken account of in the future development of the art. See HEREDITY, DOMESTICATION, CANARY, CATTLE, CELL, DOG, EVOLUTION, HORSE, HYBRID, PIGEON, POULTRY, SHEEP, VARIATION, &c.

Breede, a river of the Cape of Good Hope, rises in the Warm-Bokkeveld, and flows chiefly in a south-east direction through the district of Swellendam, entering the Indian Ocean at St Sebastian's Bay, about 60 miles N.E. of Cape Agulhas. It drains a very fertile district, and is used for irrigation purposes. Port Beaufort, at its mouth, is blocked by a sand-bar, but the river is navigable for some miles.

Breeze. See BOT, CLEG.

Bregenz, capital of Vorarlberg, is picturesquely situated on the east shore of the Lake of Constance, 5 miles S.E. of Lindau. The opening of the Arlberg Railway (1884) increased its importance. The ancient *Brigantium*, it was an important Roman station, and was for several centuries one of the chief fortified places in southern Germany. During the Thirty Years' War, the Swedes in 1646 stormed and captured the fortress. Pop. 10,000.

Brehm, ALFRED EDMUND, naturalist, was born 2d February 1829, at Renthendorf, in Thuringia, and was son of the pastor there, Christian Ludwig Brehm (1787–1864), a great ornithologist. Young Brehm travelled five years in Africa, then went to

Jena and Vienna to study natural science. He subsequently travelled in Spain, Norway, Lapland, Siberia, and Turkestan, became keeper of the Hamburg Zoological Garden in 1863, in 1867 founded the Berlin Aquarium, and died in his native place, 11th November 1884. His *magnum opus* is the *Illustriertes Thierleben* (1863; re-edited by Otto zur Strassen and others, 1911 *et seq.*). From *North Pole to Equator* has been translated into English (1896).

Brehon Laws, the name given by the English to the system of jurisprudence which prevailed among the native Irish from an early period till towards the middle of the 17th century. The *breitheamhuin* (pronounced *brei-hoo-in* or *brehon*), from whom the laws have received their name, are supposed to have been hereditary judges, who administered justice among the members of their tribe seated in the open air, upon a few sods, on a hill or rising ground. The poet Spenser in his *View of the State of Ireland*, written in 1596, describes the Brehon Laws; but Spenser was ignorant that pecuniary compensation for manslaughter had obtained in the ancient laws as well of England as of most European nations. He was mistaken, too, in believing that the Brehon Laws were an unwritten code. Among numerous portions of manuscript collections of the Brehon Laws still existing in public and private libraries may be mentioned those of the Royal Irish Academy, Trinity College, Dublin, the British Museum, and the Bodleian. These manuscripts are regarded as varying in date from the early part of the 14th to the close of the 16th century. For the laws themselves a much higher antiquity is claimed. Portions of them are referred to in compilations of the 10th century, and it may be, as has been suggested, that the redaction of them in their present form was due to Cormac Mac Cuilleainain (killed 903 A.D.), king and archbishop of Cashel, a man of great learning and energy; but of this there is no actual record. The recension of the code, known as the *Seanchus Mor*, is traditionally ascribed to St Patrick (5th century), who is said to have expunged from the laws all institutions savouring of heathenism; and here again we are met with references to written laws dating from the reign of Cormac Mac Art (3d century). The language in which the Brehon Laws are composed is Ancient Irish, and though in general intelligible enough, it is sometimes rendered obscure by technical and obsolete legal terms, of which the exact meaning is uncertain.

The form of society presupposed by the laws is such as is known to have existed in Ireland in the earliest historic times. The basis of it is the tribe, and the principal occupation is the pasturage of cattle or the tillage of the soil. The whole community is arranged in a graded system of monarchs, provincial kings, chiefs, proprietors, clansmen, and serfs of an alien race. The land seems to have been divided into two parts, one as common pasture ground, the other portioned out among the chiefs and other tribal dignitaries, with the poorer clansmen and serfs holding as tenants under a proprietor. The use of coined money is apparently unknown, as fines and valuations are represented in terms of so many head of cattle.

Every part of life comes within the range of the law; there are regulations for the fostering of the children of the nobles, for their food and education, for their dress and its quality, along with ordinances regulating the holding of courts and the giving of evidence. And in the midst of all this, there survive the remains of a pagan past not yet eradicated by Christianity, such as the laws of marriage and magical ordeals. In 1852 a Royal Commission was appointed 'to

direct, superintend, and carry into effect the transcription and translation of the ancient laws of Ireland. The translation of the Brehon Laws was entrusted to the two most eminent Irish scholars—Dr John O'Donovan, professor of Celtic in the Queen's College at Belfast, and Eugene O'Curry, professor of Irish Archaeology in the Roman Catholic university of Ireland. The work, completed under various editors, comprises, with glossary, six volumes (1865–1901), and is called *The Ancient Laws and Institutes of Ireland*. Along with the Irish text, an English translation is given, and they give a vivid and characteristic picture of the polity and social life of a Celtic people. Sophie Bryant published (1923) *Liberty, Order, and Law under Native Irish Rule: A Study in the Book of the Ancient Laws of Ireland*.

Breisach, A.T., a town of Baden, situated on an isolated basalt hill (804 feet) on the right side of the Rhine, 14 miles W. of Freiburg. The *Mons Brisiacus* of Cæsar, it was taken by Ariovistus when he invaded Gaul; being regarded as the key to the west of Germany, it figured prominently in the wars of the 17th and 18th centuries. The minster is a 13th-century structure. Pop. 3500.—Neu Breisach, on the other side of the Rhine, in Alsace, was built by Louis XIV. in 1697, when Alt Breisach was given back to the empire.

Breisgau, a district of Baden extending along the right bank of the Rhine, from Strasburg to Basel, embracing the southern Black Forest. The chief town is Freiburg.

Breitenfeld, a village of Saxony, 5 miles N. of Leipzig, remarkable for three battles fought in its neighbourhood. In the first, fought on the 17th September (old style, 7th) 1631, Gustavus Adolphus inflicted a decisive defeat upon the imperialists under Tilly, who, as well as his generals, Pappenheim and Fürstenberg, was wounded. The second battle was also a victory of the Swedes under Torstenson over the imperial forces under the Archduke Leopold and Piccolomini, 2d November (old style, 23d October) 1642. The third battle was one act of the great 'Battle of the Nations' at Leipzig, 16th October 1813.

Breitmann, HANS. See LELAND (CHARLES GODFREY).

Bremen, one of the three free cities and states of Germany, is situated on and near the estuary of the Weser. The state—area, 99 sq. m.; pop. (1919) 311,287—comprises three pieces of territory, viz. Bremen city (and environs); Vegesack, adjoining it, lower down the Weser; and Bremerhaven (q.v.), at its mouth. Bremen city lies 34 miles SSE. of Bremerhaven, and 63 miles NW. of Hanover. Pop. (1875) 102,177; (1890) 124,955; (1919) 258,612, mostly Protestants. Bremen is divided into the Old and the New Town—the former on the right, the latter (dating from 1620) on the left, bank of the river, which is spanned by four bridges. The ramparts and bastions round the old town have been levelled and formed into public promenades, laid out with excellent taste. The cathedral (1043–70; reconstructed 13th to 17th century; restored in 1888), the Church of our Lady, St Ansgar's, the beautiful Gothic town-hall (1409), with its famous Ratskeller, the 'Schutting' or merchants' hall (1537), the Gewerbehau (guildhall), the exchange, the museum, the post-office, and the observatory of Dr Olbers are outstanding buildings. Bremen has delightful pleasure-grounds, and is in many respects a model city. With its excellent railways and waterways, it is an exceedingly thriving port, the centre of a great transit traffic, and now ranks second in Germany for foreign trade. At one time all large vessels had to stop at Bremerhaven; but a comprehensive scheme for the deepening of the

river-bed, carried out at enormous cost since 1885, has enabled ships of 5000 tons to enter its docks. Bremen is the headquarters of several big steamship companies, including the North German Lloyd (founded 1857). In commercial relations with all parts of the world, especially the United States, Bremen enormously expanded her trade during the second half of the 19th century, and rose to be the leading port in the world for the import of tobacco and rice, the leading port on the Continent for the import of cotton and indigo, while for wool and petroleum it ran Antwerp and Hamburg close. Other imports are coal, grain, nuts, dye-woods, iron, copper, asphalt, phosphates, coffee, jute, oil seeds and cake, wine, sugar. There is a big lumber trade. Large quantities of tobacco, cotton, &c. are re-exported. Exports include woollen goods, linens, glass, rags, machinery, mineral salts, colours, and toys. There are manufactures of woollens and cottons, cigars, paper, rope, and breweries, distilleries, rice-mills, jute-mills, oil and sugar refineries, extensive shipbuilding yards and engineering works. Bremen, which is well supplied with floating docks, tidal basins, and all the equipment of a great modern port, has also a huge passenger traffic, and is the chief emigration port in Germany (239,564 emigrants embarked here in 1913).

Bremen first became of historical note in the 8th century, when it was erected into a bishopric by Charlemagne. It soon attained considerable commercial importance, and became one of the principal cities of the Hanseatic League (q.v.). It frequently suffered at the hands of the French, and was in 1810 incorporated with the French Empire, but recovered its independence in 1813, and by the Congress of Vienna was admitted in 1815 as one of the Hanse towns into the Germanic confederation. Oldenburg rivalry was defeated, and a new era of expansion was opened up by the acquisition of Bremerhaven by Burgomaster Smidt in 1827. In 1867 it became a member of the North German confederation, and now it forms a state of the German federal republic. In 1884 it agreed to a surrender of its privileges as a free port, to take effect from 1st October 1888; but certain docks and warehouses of later construction (the *Freihafen Gebiet*), as well as the Bremerhaven docks, are excepted from this arrangement. The government, republican in form, was till 1918 entrusted to a senate of 16 members, two of whom were chosen burgomasters, and to a municipal council of 150 burgesses. These were then superseded by a Workers' and Soldiers' Council; and in 1919-20 a new constitution was adopted. The citizens elect the Bürgerschaft (120 members), and the Bürgerschaft elects a senate (18) as executive. Two bürgermeister are chosen from the senate. See Wilson King's *German Free Cities* (1914).

Bremer, FREDRIKA, a well-known Swedish novelist, was born at Tuorla near Åbo, in Finland, 17th August 1801; and was brought up at Årsta, not far from Stockholm. At seventeen she was taken for her health on a tour through Germany, Switzerland, and France. Soon after, the poetry of Schiller set her young imagination aglow, and the restlessness of her temperament drove her to writing—the only outlet for her energy that was open to her. In 1828 appeared the first volume of her *Sketches of Everyday Life*, but the second volume, *The H. Family* (1833; Eng. trans. 1844), first revealed her power. From this time she devoted herself to writing stories that quickly became popular in translations far beyond the bounds of Sweden, and she varied her literary labour by long journeys in Italy, England, the United States, Greece, Palestine, which supplied the materials for her *Homes of the New World* (1853) and *Life in the Old World* (1862), full of

fine descriptions of scenery and vivid pictures of social life, with sound views on political and moral questions. The admirable translations of Mary Howitt had preceded her in America as well as England, and ensured her an equally warm welcome on both sides of the Atlantic. On her return to Sweden she gave herself up to philanthropy, but more particularly to the education and emancipation of women, and the consequent propagandist character of her later novels, *Hertha* and *Father and Daughter* (1859), was detrimental in no small degree to their literary value. Her religious views she set forth in her *Morning Watches* (1842). She spent her last years at Årsta, and died there 31st December 1865. Her *Life and Letters* were edited by her sister in 1868, and were at once translated into English and German. She has been called, and not inaptly, the Jane Austen of Sweden. She resembled the English novelist in delicacy, shrewdness, and love of quiet domestic incident, but fell far short of that subtlety in simplicity which is the secret of her charm, and that marvellous insight into women, if not men, on which depends her power. Of Miss Bremer's stories perhaps the most perfect is *The Neighbours* (1837; Eng. 1844). *The Diary, The President's Daughters, Brothers and Sisters, Strife and Peace, and Scenes in Dalecarlia* are only less popular.

Bremerhaven, the seaport of Bremen state, on the east shore of the Weser estuary, 39 miles NNW. of Bremen (q.v.). It was founded by Bremen in 1827 on ground acquired from Hanover, and prospered rapidly. A second dock was opened in 1866, a third in 1874 (extended in 1899). Bremerhaven virtually forms one city with the Prussian towns of Lehe, to the north, and Geestemünde, to the south, being connected with the latter by a drawbridge across the Geeste. A well-equipped port, with dry-docks, repair-yards, &c. (including those of the North German Lloyd), Bremerhaven has a *Freihafen*, and is entirely absorbed in shipping and commerce. Pop. (1850) 3500; (1910) 24,165; (1919) 22,382.

Brendan, St., of Clonfert, born at Tralee in 484, studied under St. Jarlath of Tuam, and was ordained by Bishop Erc. His name is memorable chiefly for his voyages in search of 'the mysterious land far from human ken.' After seven years' fruitless wandering he returned, but once more, in a ship of wood instead of hides, set sail with sixty friends, and at length after many wanderings reached 'that paradise amid the waves of the sea.' Brendan founded a monastery at what is now Clonfert, and died in 577 in the ninety-fourth year of his age. His festival is on the 16th of May. The *Navigation of St. Brendan* was a very popular book in western Europe as early as the 11th century, but the two voyages were compressed into one, and many other adventures added. In maps before Columbus's day, 'St. Brendan's country' is placed to the south of the island of Antilia and west of the Cape Verde Islands. See O'Donoghue's *Brendeniana* (1894), and Lord Bute in the *Scottish Review* for 1893.

Brenner Pass, a pass in the Central Tyrol Alps, on the road between Innsbruck and Bozen. It is the lowest pass which crosses the main chain of the Alps, the summit being only 4500 feet above the level of the sea. Lofty mountains rise above it, but the scenery is less sublime and less interesting than that of any other of the great passes of the Alps. It is open at all seasons of the year. At the summit of the pass the traveller finds in close contiguity the Eisach, a small stream, which, after growing to be a considerable river, joins the Adige, and the Sill, a tributary of the Inn; the

one stream flowing to the Adriatic, and the other into the Black Sea. In 1867 a railway through the pass was opened, and thus a complete line of railway communication was established between Germany and Italy. This work was begun by the Austrian government when Venetia belonged to the Austrian empire. The distance from Innsbruck to Botzen in a direct line is only 52 miles, but frequent windings extend the railway to 78 miles. It passes over numerous viaducts and bridges, and through twenty-seven tunnels, one of which has a length of 935 yards. This line is still the shortest route between the eastern half of Germany and Italy. There has been a carriage road over the pass since 1772.

Brennus, the Latinised form of a Celtic royal title.—(1) The leader of the Senonian Gauls who, in 390 B.C., crossed the Apennines and overthrew on the banks of the Allia (q.v.) the Roman army. On their entry into Rome the Gauls found that most of the inhabitants had fled save the senators, who, with pathetic heroism, had resolved not to survive the destruction of their homes. Clothed in their robes of dignity or office, and sitting in their curule chairs, they waited the approach of their enemies, and received their death in majestic silence. Brennus plundered the city and besieged the capitol for six months, during which time occurred the famous night-attack, which would have been successful had not the cackling of the geese in Juno's temple awakened the garrison. The Romans were at length compelled to treat with the besiegers. They offered a thousand pounds of gold for their ransom, which was agreed to. To counterpoise the gold, Brennus flung his sword into the opposite scale, crying as he did so, *Væ victis* ('woe to the vanquished'). But Camillus, who had been recalled from banishment and appointed dictator, appeared with his soldiers in the nick of time, at once set on the enemy, and after a desperate struggle cut them off to a man. According to Polybius the Gauls returned home in safety with their booty.—(2) The Gallic chief who invaded Greece, 279 B.C., at the head of 150,000 foot and 20,000 horse. After desolating Macedonia, he forced his way through Thessaly to Thermopylæ, and hurried on to Delphi with a view to plunder. The Delphians bravely resisted, and aided by an earthquake and a terrible storm, besides the supernatural help of Apollo, they utterly routed the Gauls, who fled in dismay. Brennus was taken prisoner, and drank himself to death in his despair.

Brenta (*Medoacus Major*), a river of North Italy, issuing from a small lake in the Tyrol, and flowing 120 miles southward and eastward through the Venetian territory, till it falls into the Gulf of Venice at the haven of Brondolo. The old bed of the river was made use of as a canal, which forms the chief communication by water between Venice and Padua; while the Brenta is but little used for navigation.

Brentano, KLEMENS, romanticist, the brother of Goethe's 'Bettina,' was born at Ehrenbreitstein, 8th September 1778. Save for the six years (1818-24) he passed with the 'Nun of Dülmen,' recording her revelations, he led a restless, unsettled life, and showed plain signs of derangement some years before his death at Aschaffenburg on 28th July 1842. In his earliest poems the peculiarities of the Romantic school of his time are carried to excess. His dramatic productions, the best of which is *Die Gründung Prags*, are characterised by great dramatic power, amusing though rather far-fetched wit, and a wonderful flow of humour. Brentano was most successful in his smaller novels, particularly in the *Geschichte vom braven Kaspar*. His

collected works fill 9 vols. (1852-55), and there is a good selection by Diel (1873), who also wrote his *Life* (1878). See L. Brentano, *Clemens Brentanos Liebesleben* (1921), and the article ARNIM.

Brentano, LUJO, political economist, was born at Aschaffenburg, in Bavaria, 18th December 1844. He studied at Dublin, and at four German universities; and after attaining a post in the royal statistical seminary in Berlin, went to England to study the condition of the working-classes, and especially trades' associations and unions. The outcome of this was his work *On the History and Development of English Guilds* (Lond. 1870); *Die Arbeitergilden der Gegenwart* (2 vols. Leip. 1871-72). He has been professor at Breslau (1873), Strassburg, Vienna, Leipzig, Munich (1891-1917). He supports the 'Socialists of the chair' (*Kathedersozialisten*) against the German free-trade school, and has written works on wages (1877), labour in relation to land (1877), and compulsory insurance for workmen (1881), the English Chartist, free-trade and protection, German trade policy and industrial organisation (1908), and Malthusianism (1909).

Brentford, the county town of Middlesex, 10 miles W. of Paddington station, at the influx of the Brent to the Thames, which is crossed here by a bridge leading to Kew. Consisting chiefly of one long irregular street, it has figured in literature, not always creditably. Falstaff disguises himself as a 'fat woman of Brentford.' Buckingham, Cowper, and others allude to its 'two kings.' Thomson calls it 'a town of mud'; Gay has spoken of its 'dirty streets'; and its modern condition is not irreproachable. It has gin-distilleries, a brewery, sawmills, a soap-work, the Grand Junction Waterworks, the terminus of the Grand Junction Canal, and railway docks. It lies in a market-gardening district. Here Edmund Ironside defeated the Danes in 1016, after expelling them from London; in 1558 six martyrs were burned at the stake; and in 1642 the Royalists under Rupert defeated the Parliamentarians under Colonel Hollis. Pop. 17,000.

Brent Goose, or BRENT BARNACLE (*Bernicula brenta*), a species of wild goose, breeding in the far north, coming south in winter in great numbers, and often shot along British and other coasts. It is common in markets. The head, neck, long wing-feathers, and tail are black, the belly white, the rest slaty-gray. It is often called the black goose. It lives on marine plants and small animals. There are twelve other species—e.g. *B. leucopsis* and *B. ruficollis*. See BARNACLE GOOSE, GOOSE.

Brentwood, an urban district in Essex, 10 miles SW. of Chelmsford by rail, stands on an eminence in a well-wooded country. It has a richly endowed grammar-school, founded by Sir Anthony Browne, Chief-justice of England, in 1567. There are remains of an old chapel, dedicated in 1221 to St Thomas à Becket. Pop. 7000.

Brenz, JOHANN, the Reformer of Württemberg, was born 24th June 1499, at Weil, in Swabia, and went in his thirteenth year to study at Heidelberg. From Luther's visit to Heidelberg in 1518 he became his zealous adherent, and after his appointment as a preacher in the imperial free city of Hall, in Swabia (1522), he openly attached himself to the Reformation. He was at the Marburg Disputation in 1529, and the Diet of Augsburg in 1530, and in 1536 was summoned by Duke Ulrich of Württemberg to lead the Reformation there. For his energetic opposition to the Interim of Charles V. he was forced to flee to Stuttgart, where in 1553 he became 'propst' (or superintendent), and died 11th September 1570. Brenz was co-author of the Württemberg Confession of Faith, and his Catechism (1551) has held the next place to that of Luther in Protestant Germany. Eight

volumes of his collected works were published in 1576-90. See his biography by Haitmann (1862).

Brescia, a city of Italy, in Lombardy, 51 miles E. of Milan by rail. It is romantically situated on the rivers Mella and Garza, in a wide fertile plain, at the foot of the Brescian Alps. On a hill-top is an old castle formerly known as the Falcon of Lombardy. The city is for the most part regularly built, with many fountains, and besides two cathedrals—the old (dating from the 7th century), and the new (1604-1825)—it has numerous ancient churches, and the Martinengo Gallery (town property), with pictures and frescoes, including many by Moretto and masters of the Venetian school. The old Broletto Palace dates from the 12th century, the Municipio from 1492. A valuable public library, the *Biblioteca Queriniana*, was founded and nobly endowed in 1750 by Cardinal Querini; it contains many rare manuscripts. The Temple of Hercules, built by Vespasian, and excavated in 1822, forms a repository for classical antiquities. A statue of Arnold (q.v.) of Brescia was unveiled in 1882. Brescia manufactures woollens, silk, linen, iron-ware, arms, cutlery, &c., and its wine is of good quality. Brescia, whose old name was *Brixia*, was a town of the Cenomani, and its inhabitants were allied with the Romans when Hannibal crossed the Alps. It was captured by the Huns, and passed through the hands of Lombards, Charlemagne, the Franks, the Germans, and was taken by the French under Gaston de Foix in 1512. The republic of Venice held it till its own downfall in 1797. In March 1849 Brescia, as the only important town opposed to Austrian rule in Lombardy, was besieged by Haynau, and forced to capitulate. The city and province (area, 1800 sq. m.; pop. 600,000) were incorporated with the kingdom of Italy after the war of 1859. Pop. (commune), 83,000.

Breslau, the capital of German Silesia, 150 miles SE. of Frankfurt-on-the-Oder by rail, is situated at the confluence of the Ohle and Oder, which divides it into two parts, connected by numerous handsome bridges. The fortifications were converted in 1813 into beautiful promenades, and the ditch has been transformed into an ornamental sheet of water. The newer streets are spacious and regular, the houses stately and handsome, in pleasant contrast to the sombre, massive structures of the old town. Educational institutions are numerous, including a university founded by the Emperor Leopold I. in 1702. Besides a cathedral (1148-1680; restored 1875), Breslau has many churches, the most remarkable being the Protestant church dedicated to St Elizabeth, with a steeple 298 feet in height, and a splendid organ; a Jewish synagogue; and a bishop's palace. The other buildings include the Rathaus, the former royal palace, now used as government buildings, exchange, and court-house. Breslau has many hospitals and charitable institutions. Its position in the centre of the manufacturing and mining districts of Silesia secures it a large trade, which its railway connection with all the important cities on every side, and the facilities of communication which the Oder affords, enable it to turn to the best account. Its linen fairs and wool-mart were renowned of old. It has manufactures of textiles, machinery, railway material, furniture, musical instruments, earthenware, carpets, sugar, &c., with many distilleries; and a trade in corn, coal, metals, timber, hemp, and flax. Breslau (Polish *Wrocław*, Czech *Vratislav*) is a city of Slavonic origin, and was for many centuries occupied alternately by the Poles and the Bohemians. It afterwards passed to Austria, from which it was taken by Frederick II. of Prussia in 1741. Sixteen years

afterwards it was captured by the Austrians after a bloody battle, but retaken by Frederick in about a month. From that time until 1814 it was frequently besieged. Breslau is of high military importance. Pop. (1870) 207,997; (1890) 335,186; (1910) 514,765; (1919) 528,200 (three-fifths Protestants).

Bressay, one of the Shetland Islands, separated from Lerwick by Bressay Sound. It is 6 miles long, 1 to 3 miles in breadth, and 10½ sq. m. in area. The prevailing rocks are Old Red Sandstone. Flag and roofing stones are quarried for exportation. The coast is rocky, there are several caverns, and the highest point is 724 feet above sea-level. Pop. 600, most of them fishermen. Bressay Sound is one of the finest natural harbours in the world, and is a rendezvous for fishing-boats. In its west centre is the harbour of Lerwick with lighthouse. East of Bressay, and separated from it by a narrow and dangerous sound, is a rocky isle, called Noss, 6 miles in circuit, girt on all sides by perpendicular cliffs, and rising abruptly from the sea to the height of nearly 600 feet, with a flattish top. A detached rock or holm, on the south-east side, in former years communicated with Noss by means of a small cradle run on strong ropes.

Bresse, a district in eastern France, bounded by the Saône and the Jura range, the Dombes and the Doubs, with Bourg as chief town. It raises cattle and noted poultry.

Brest, a strongly fortified city in the department of Finistère, one of the chief naval stations of France, is situated 313 miles W. of Paris, on the north side of the Bay or Road of Brest. One of the finest harbours in Europe, the roadstead is formed by the promontory of Finistère on the north and of Quélern on the south. The only entrance to the bay is by a narrow channel called *Le Goulet*, which is scarcely a mile wide, and is strongly defended by batteries; the difficulty and danger of access to hostile ships being increased by rocks in the middle of the channel. The roadstead from this entrance to the mouth of the Elon is about 6 miles in length. Under Napoleon III. and from 1883 onwards vast sums have been expended on harbour and fortification works. The small river Penfeld flows through the town; on its left bank is the town proper, on its right the suburb of *Recouvrance*, connected by a splendid iron swing-bridge (1861), 65 feet high, and 347 long; its mouth is the naval port. Brest is, on the whole, irregularly built on an uneven site, and has steep, narrow, dark streets. In some places communication between the lower and upper parts of the town can be effected only by stairs. A fine avenue, the *Cours d'Ajot*, runs along the shore to the south of the town towards Portstrein. Here the commercial harbour is situated. There are an old castle, an exchange, town-house, observatory, and public library. Brest has extensive shipbuilding yards, rope-walks, quays, arsenals, and dry-docks; naval schools, barracks, and hospitals. The principal imports are coal, grain, fertilisers, timber; exports are fruit, vegetables, farm produce. Chiefly engaged in the equipment of the navy, Brest has important fisheries (sardines, mackerel, oysters, &c.); also sawmills, breweries, tanneries, soap-works, and manufactures of candles, corks, and varnished hats. The Bagnes or hulks were closed in 1860. Its splendid position made Brest an object of contention to French, English, and Spaniards. The Count of Leon ceded Brest to the first Duke of Brittany in 1040; it was given up to the English by Duke John IV. in 1372, but again came into the hands of the dukes; it was held by an English garrison till 1397. Again held by the English, it was retaken by the French, to whom it passed on

the marriage of Louis XII. to Anne of Brittany. In 1631 Cardinal Richelieu resolved to make it a naval station, and commenced the fortifications completed by Vauban. In 1694 the English under Lord Berkeley were repulsed here with great loss. In 1794 the French fleet under Villaret-Joyeuse was defeated off Brest by the British fleet under Howe on 'the glorious first of June.' Pop. (1872) 66,272; (1911) 90,540; (1921) 73,960.

Brest-Litovsk (Polish *Brześć-Litewski*), a strongly fortified town of Poland, on the Bug, commands the intersection of several important railways, being 132 miles ESE. of Warsaw, and 682 miles WSW. of Moscow. It has an extensive trade in its cloth manufactures, Russian leather, soap, and wood. Once the occasional residence of the kings of Poland, it is now the seat of a Greek and an Armenian Catholic bishop. It fell to Russia in 1795. By the treaty of Brest-Litovsk (3d March 1918; abrogated by the treaty of Versailles) the Russian Bolshevik government gave up the western and Caucasian regions, and agreed to an indemnity and economic advantages to Germany. Pop. 54,000.

Bretagne, BRETON LITERATURE. See BRIT-TANY.

Brethren. See BROTHERHOODS.

Brétigny, a village in the French department of Eure-et-Loir, 50 miles SW. of Paris. Here, in 1360, Edward III. concluded a peace with France, by which John II. of France was released from his captivity in England on agreeing to pay three million crowns for his ransom, whilst England renounced her pretensions to Normandy, Anjou, Maine, and Touraine, and was confirmed in possession of Gascony, Guienne, and several other parts in France, recently acquired by conquest.

Breton, CAPE. See CAPE BRETON.

Breton, JULES ADOLPHE AIMÉ LOUIS (1827-1906), born at Cournières in Pas de Calais, was trained as a painter at Ghent, at Antwerp under Wappers, and at Paris under Dolling. His earlier subjects, such as 'Misère de Désespoir' (1849), are taken from the French revolutionary period; but he soon turned to scenes from peasant life which he treated in a most poetic and suggestive manner, with an admirable union of style with realism. In 1853 he exhibited 'Le Retour des Moissonneurs,' in 1855 his celebrated 'Les Glaneuses,' in 1875 'Les Feux de la Saint-Jean.' He gained distinction also as a poet by his *Les Champs de la Mer* (1875) and *Jeanne* (1880), and wrote on painting and his own life.

Breton, NICHOLAS (1545?-1626?), was the son of William Breton, a London merchant, and stepson of George Gascoigne. For sixty years at least he was an assiduous and fluent writer of lyrical, pastoral, satirical, religious, romantic, and humorous verse and prose. With a freedom from coarseness quite exceptional in his time Breton unites great freshness of observation of nature, melody of versification, ease, and lucidity. In satire he introduces a genial humour unknown to his English contemporaries, and his management of stanza-forms for this purpose anticipates Flere. All his work suffers in effectiveness from those qualities of which his refinement and ease are the better side; but his spirits never flag. His *Works* were edited by Gosart (1877-93).

Bretón de los Herreros, MANUEL (1796-1873), Spanish dramatist, was born at Quel (Logroño), and served as a volunteer in the army from 1814 to 1822. Subsequently he held several government offices, but was always losing them—finally in 1840—on account of his expression of Liberal opinion. He brought out upwards of 150 pieces, partly original, partly adaptations from the older Spanish classics, and partly translations from

the Italian and French. He also wrote innumerable poems, tales, and sketches.

Bretschneider, HEINRICH GOTTFRIED VON, a satirist, of unsettled life and eccentric habits, born at Gera in 1739, from the Moravian Institute at Elbersdorf passed to the Gymnasium at Gera, and at seventeen entered the army. In 1778 he became librarian to the university of Ofen (Buda), and in 1782 Joseph II. gave him a government appointment. He died in 1810. Of his numerous works, including plays and poems, the chief are his satires, *Almanach der Heiligen auf 1788* and *Waller's Leben und Sitten* (1793).

Bretschneider, KARL GOTTLIEB, a distinguished German theologian, born 11th February 1776, at Gersdorf, in Saxony, studied theology at Leipzig, was appointed pastor at Schneeberg in 1807, general superintendent at Gotha in 1816, and afterwards councillor of the Upper Consistory there. He died at Gotha, 22d January 1843. Bretschneider established a reputation as a sound and judicious thinker of rationalistic bias, and his theological writings are admitted to have a permanent value. In 1820 appeared his *Probabilia de Evangelii et Epistolarum Johannis Apostoli Indole et Origine*, an attack upon the Johannine authorship from internal evidence, and in 1824 his *Lexicon Manuale Græco-Latinum in Libros Novi Testamenti*. Another work of importance is his *Handbuch der Dogmatik* (4th ed. 1838). Besides these, Bretschneider wrote on various theological questions and controversies. An autobiography was published at Gotha in 1851.

Bretten, a town of Baden, the birthplace of Melancthon, 16 miles ENE. of Karlsruhe by rail. The house in which the Reformer was born belongs now to a foundation bearing his name for the support of poor students, established in 1861. A monument was erected in 1867. Pop. 5000.

Bretts and Scots, THE LAWS OF THE (Lat. *Leges inter Brettos et Scotos*), the name given in the 13th century to a code of laws in use among the Celtic tribes in Scotland. The 'Scots' were the Celtic people dwelling in the western and more mountainous districts north of the Forth and the Clyde, who, when it became necessary to distinguish them from the Teutonic inhabitants of the low country, received the names of 'the Wild Scots,' 'the Irishry of Scotland,' and, more recently, 'the Scottish Highlanders.' The 'Bretts' were the remains of the British or Welsh people, who were at one time the sole or chief inhabitants of the region now divided into the shires of Dumfries, Renfrew, Ayr, Lanark, Peebles, Selkirk, Roxburgh, Dumfries, and Cumberland. This province was for some centuries an independent kingdom, known by the names of 'Cumbria' and 'Strathclyde.' It became about the middle of the 10th century a tributary principality held of the king of the English, by the heir of the king of the Scots. It so continued till after the beginning of the 12th century, when Cumberland having been incorporated with England, the gradual absorption of the rest of the territory into the dominions of the king of the Scots seems to have been imperceptibly completed. The last 'Prince of Cumbria' named in record was the brother and heir of Alexander I. of Scotland, 'the Earl David,' as he was called, who, on his brother's death in 1124, himself became king of the Scots. No more is heard of Cumbria as a principality; but 'the Welsh' continue to be named among its inhabitants, in the charters of King David's grandsons—Malcolm the Maiden (1153-65), and William the Lion (1165-1214). And they seem to have retained more or less of their ancient Celtic laws until after the beginning of the 14th century. It was not until the year

1305 that an ordinance of Edward I. of England, who appeared then to have reduced all Scotland to his subjection, decreed 'that the usages of the Scots and the Bretts be abolished, and no more used.' It is unknown how far this prohibition took effect. Of the code which it proscribed, only a fragment has been preserved. It was printed by Sir John Skene, in his *Regiam Majestatem* (1609); and by Thomas Thomson and Cosmo Innes, in the *Acts of the Parliaments of Scotland*, vol. i. (1844), where the laws are given in three languages—Latin, French, and English. The French version, which is the oldest, is printed from a manuscript of about 1270, formerly in the public library at Bern, in Switzerland, now in the Register House at Edinburgh. The fragment of the 'laws of the Bretts and the Scots' thus published, is of much the same nature as the ancient laws of the Anglo-Saxons, the Welsh, the Irish, and other nations of Western Europe. It fixes the *cro*, or price at which every man was valued, according to his degree, from the king down to the churl, and which, if he were slain, was to be paid to his kindred by the homicide or his kindred. The *cro* of the king was 1000 cows; of the king's son, or of an earl, 150 cows; of an earl's son, or of a thane, 100 cows; of a thane's son, 66½ cows; of the nephew of a thane, or of an oghthiern, 44 cows and 2½ pence; and of a villain or churl, 16 cows—all persons of lower birth than a thane's nephew or an oghthiern being accounted villains or churls. The *cro* of the married woman was less by a third than the *cro* of her husband. The *cro* of the unmarried woman was as much as the *cro* of her brother. A chapter 'of blood-drawing'—corresponding with the *blod-wite* of the English—fixes the fine to be paid for a blow to the effusion of blood, according to the degree of the person wounded and the place of the wound.

Bretwalda, a title of supremacy among the early Anglo-Saxon kings, the exact signification and history of which are highly uncertain. The *Anglo-Saxon Chronicle* says of Egbert, 'and he was the eighth king that was *Bretwalda*,' and the word only occurs elsewhere in an English and Latin charter of Athelstan in 934, in which that king is styled 'King of the Anglo-Saxons and *Brytaen-walda* of all the island.' Palgrave attempted to explain the title as 'wielder of Britain,' an honour to which the most powerful king was elected, and which was substantially an assertion of a kind of continuity with the old Roman imperial power within the island. Kemble explained the word as merely 'wide ruler' (*bryten*, 'broad'), and ridiculed the idea of any kind of federation and elective hegemony among the early English kings. Freeman inclined to 'an intermediate position between Kemble and Palgrave,' but refused to admit the idea of Roman influence, maintaining that the institution was of purely English growth. The *New English Dictionary* favours Palgrave's view.

Breughel, PIETER, the founder of a family of Dutch painters, was born in the village of Breughel, near Breda, in 1525 (or, as others say, 1520), and died at Brussels in 1569. After travelling through Italy and France, he fixed his residence at Antwerp, where he was elected to the Academy. He painted chiefly the pleasures of rustic life, which he transferred to his canvas with vivid colouring, and at times unnecessary coarseness.—His son, PIETER, distinguished by the strange title 'Hellish Breughel'—because he loved to paint scenes in which the leading characters were devils, hags, or robbers—was born about 1564, and died 1637.—JAN, brother of the preceding, usually called 'Velvet Breughel,' from his rich dress, was born in 1568, and died in 1625. He was chiefly a flower-painter, but was

also distinguished for his landscapes and for his minute finish of small figures. He painted several works in concert with Rubens, who supplied the chief figures.—Other members of the same family attained to some note, in most cases as painters of still-life. See monograph by Michel (Paris, 1892).

Breve, a note in Music. The name was originally applied to the shortest of the three notes used in early music, but is now appropriated to the longest note met with, and it occurs but seldom, except in church music, modern music being divided into bars which usually fall short of it in length. It has the time-value of two semibreves, and was formerly written thus, \equiv , now $\text{||}\text{O}\text{||}$ or $\text{||}\text{C}\text{||}$. The expression *alla breve* at the beginning of a piece—also denoted by the vertical stroke through the sign of common time, C —signifies that the time-value of the notes is reduced to one-half.

Breve, or BRIEVE, in the practice of the Scots law, is a writ issuing from Chancery in the name of the crown, to a judge, ordering him to try by jury the points or questions stated in the breve. In ancient times these writs appear to have been the foundation of almost all civil actions in Scotland; but latterly they have been used only in the following cases: (1) Breve of Inquest, now, however, superseded by a petition of service to the sheriff to ascertain the heir of a deceased person. (2) Breve of Tutory, the purpose of which is the appointment, as guardian to a pupil, of the nearest agnate or person most nearly related through the father, of lawful age. (3) Breves of Idiotry and Furiosity, for the appointment, in case of ascertained insanity, of the nearest male agnate, of lawful age, as guardian or curator. Proceedings 2 and 3, however, are much superseded by the appointment of judicial officers. (4) Breve of Terce is to enable a widow to recover her terce or dower. It is issued to the sheriff of the county, who divides the possession of the land between the widow and the heir (see TERCE). (5) Breve of Division amongst heirs-portioners. By means of this breve an heir-portioner—i.e. one of two or more sisters succeeding in equal portions to a landed estate—may have her share of the lands separated or set apart by a judge, who appoints an inquest, or jury of fifteen persons. An arbitration or ordinary action is now more generally resorted to. See HEIRS-PORTIONERS.

Brevet (Fr., 'a writ' or 'warrant'), in the British army, is a promotion of officers by selection to a higher rank irrespective of there being any vacancies in its established numbers. A general promotion by brevet used formerly to be made once in about six years; but more recently it was limited to very special occasions, as a coronation, the birth of an heir to the throne, the termination of some great war, &c., and given only to officers who had some particular claim to promotion. A brevet was determined on by the cabinet, and carried out by the commander-in-chief. It had formed part of the British military system ever since the time of James II.; but it was unsatisfactory, because the flow of promotion caused by it was arbitrary, uncertain, and much liable to abuse. There were brevets in 1837, 1838, 1841, 1846, 1851, and 1854, some of all ranks, from lieutenant-general to captain, receiving promotion; but it must not be forgotten that death and sales had in the intervals cleared off perhaps an equal number of officers at the higher rates of pay. On one of these occasions 200 colonels were at once made major-generals. In 1854 the new major-generals alone involved an additional charge of £18,000 a year. In that year general brevets were abolished—a fixed establishment of general officers being substituted; but individual brevets

were still given to field officers after five years' service in each rank, and to all officers, except subalterns, for distinguished service in the field. This promotion carried with it the higher rate of pay, but was neither purchasable nor saleable. It has never been given to officers below the rank of captain; but in a very few special cases, such as that of Lieutenant Chard, V.C., of the Royal Engineers, after his heroic defence of Rorke's Drift in the Zulu war of 1879, a subaltern has been promoted to captain out of his turn, in order that brevet rank might be forthwith conferred. The holder retains his place and rank in his regiment if it is alone, but if acting with other troops he will take command of the whole force, provided that he is senior by brevet, or, as it is called, 'army' rank, to the other officers. This rule has been known to cause a change of command in the middle of an operation, which, on active service, is very undesirable. The official title of an officer holding brevet rank is captain and brevet-major, or the like; but an officer may have as many as three brevets, and be a captain and brevet-colonel. All colonels are placed on a seniority list for promotion to major-general, so that it is possible by means of brevets greatly to accelerate the promotion of a deserving officer to that rank.

There is no brevet promotion in the navy.

In the United States, brevet rank does not entitle the holder to the higher rate of pay, nor to corresponding rank, except under special circumstances defined by law.

Breviary. By this word Roman Catholics understand the book which contains all the ordinary and daily services of their church except (a) those connected with the celebration of the Eucharist, which are contained in the *Missal*, and (b) those for special occasions, such as baptisms, marriages, ordinations, funerals, &c., which are contained in the *Ritual* or *Pontifical*, according as they fall within the sphere of ordinary priests or of bishops. In the Established Church of England, therefore, the breviary would be exactly represented by a Prayer-book containing, after the preface, tables, &c., the morning and evening prayer, litany, Athanasian creed, collects, psalter, and all the lessons for every day in the year, with the addition of a complete set of hymns for the different occasions. What is called a 'Church Service,' with *Hymns Ancient and Modern* bound in, is, in fact, a breviary, only differing from the contents of the Latin one in the fact that it provides only for Sundays and holidays, that the hymns are more or less left to selection, and that it contains the Eucharistic and occasional offices in addition. The word breviary is colloquially applied by Latin-Catholics to the corresponding portion of the services of the Oriental churches—e.g. one may hear the remark that the services of the Greek breviary are very long, or those of the Coptic breviary very unchanging—but the present article deals only with Latin breviaries.

The word itself signifies an *abbreviation* or *summary*, and is used to indicate that the book is a *compilation* designed to obviate the necessity of using several different books in the same service, that is to say, a separate book for the prayers, a hymn-book, a Bible from which to read the lessons and Psalms, copies of the Fathers from which to read their homilies, &c. An Anglican *Church Service* is a compilation on exactly the same principle and for the same object, as well as very similar in contents. The origin of the different hours of prayer during the day, which is undoubtedly older than Christianity, and adopted by the church from the synagogue, is beyond the scope of this article, as are also the changes and modifications which they have undergone. The

compilation called the breviary is believed to owe its origin to Gregory VII. in the 11th century. It underwent several changes under succeeding popes, and in 1586 Francis, Cardinal de Quiriones, a Spaniard, published at Rome a reformed breviary which had the approval of Clement VII. and Paul III. It was, at least in the earlier editions, perhaps too sweeping in its changes, but is of great merit, insuring the reading of the whole Book of Psalms every week, and of almost all the New Testament and a great part of the Old every year. It is upon this work that the daily service of the English Established Church is largely modelled, some parts of the preface being embodied entire in that of the Book of Common Prayer. The use of this breviary was never made compulsory, but while it was permitted as a substitute for the unreformed breviary, it was very widely adopted both for public and private worship. It was, however, considered that its services were both too short and too divergent from ancient custom, and Pius V., in conformity with a decree of the Council of Trent, issued in 1568 a reformed edition of the old Roman breviary, which he imposed absolutely upon all the Latin churches, to the exclusion of the breviary of Quiriones, and of all other breviaries which did not possess an antiquity of 200 years. This breviary was further altered by Clement VIII. and Urban VIII., the latter of whom, with deplorable taste, made a series of changes in the texts of the hymns which has been most disastrous to both the literary merit and the historical interest of these poems. The breviary has since undergone many other modifications, chiefly by the addition to the calendar of great numbers of feast-days in honour of saints, to such an extent that the ordinary service of a week-day became very uncommon. Thus in 1883 Pope Leo XIII. permitted, though not commanded, the substitution for the week-day service, upon almost every day in the year, of a voluntary office of a festal character according to the day of the week. The state to which the practical use of the breviary has thus been reduced, especially by the virtual abrogation of the weekly reading of the whole Book of Psalms, which is, in theory, its main intention, is now acknowledged on all hands to call for a new and sweeping reform. This reform will probably follow, at least in this respect, the lines of the reformed breviary of Cardinal de Quiriones. It may be regarded as imminent, and had the sittings of the Vatican Council been continued, would very likely have taken place before now.

The exception made by Pius V. would have spared some at least of the old English breviaries, but owing chiefly to the English Roman Catholic clergy being educated abroad in the 16th, 17th, and 18th centuries, their use has become extinct. Great numbers of new breviaries were, however, brought into use in France in different dioceses in the 17th and 18th centuries. These are generally works compiled with great care and learning. They are mainly distinguished for an exclusive use of scriptural phrases, an intense nationalism, the substitution for early and medieval hymns of compositions written in imitation of Horace by French scholars, and certain indications of a leaning to the doctrines of Jansenism. They are now almost, if not entirely, extinct, the Roman breviary having been adopted in their stead. The principal Latin breviaries at present in use, other than the Roman, are the Monastic, used by all the male and female disciples of St Benedict—i.e. by all monks and nuns properly so called; the Dominican, used by all disciples of St Dominic; the Ambrosian, in the ecclesiastical province of Milan; and the Mozarabic, the original national rite of Spain, in use in certain places in Spain and Portugal.

What here follows will relate only to the Roman breviary. It is to be observed at the same time, that wherever the Roman breviary has been introduced, it has been subjected to additions to the calendar and other changes, so as to give it a local or national colour. In England, for instance, there are about seventy days in the year—without reckoning others within octaves, alterations in importance, or changes of date—upon which the service differs from the text of the Roman breviary.

After the general rubrics, tables to find Easter, calendar, &c., the body of the breviary is divided into five parts. The first of these consists of the Book of Psalms arranged in sections, with the daily prayers and some hymns, for the different services of the day and week. The first of these is *Matins*, which properly belongs to midnight, but is usually said in Italy about 7.30 or 8 A.M. In France, on the contrary, it is usual to forestall it on the preceding evening. It consists of Psalm xcvi. (*Venite*) and a hymn, followed by one or three sections called *Nocturnæ* or *Watches of the Night*. On Sundays there are three of these, the first containing twelve psalms, and each of the others three. At the end of each is read a lesson, divided into three portions, whence the whole are counted as nine. The first reading is from Scripture, the second from one of the Fathers, and the third from one of the Fathers, on the gospel which will later be read at mass. The *Te Deum* usually follows. On week-days there is only one *Nocturna* of twelve psalms, and one lesson (three), all from Scripture. The second daily service is *Lauds* or the *Morning Praises*, theoretically proper to sunrise. It consists of four psalms, a Scripture canticle, Psalms cxlviii., cxlix., and cl., a hymn, the *Benedictus* or Thanksgiving of Zacharias (Luke, i. 68-79), and prayers. The succeeding services, or *Little Day Hours*, are *Prime* or the *First Hour* (6 A.M.), *Terce* or the *Third Hour* (9 A.M.), *Sext* or the *Sixth Hour* (noon), and *None* or the *Ninth Hour* (3 P.M.). They are all alike, consisting of a hymn and some sections of Psalm cxix. (Vulgate cxviii.), followed by a prayer. *Prime* differs a little from the others, being susceptible of some extra and changing psalms, and on Sundays of the creed of St Athanasius, and containing special prayers for the morning; in choirs a lesson is also read at it taken from the Martyrology. *Vespers* or *Evening* is theoretically proper to sunset, and is reckoned to begin the next day, according to the eastern reckoning—'The evening and the morning were the — day.' It consists of five psalms, which vary according to the day of the week, a hymn, the *Magnificat* or Thanksgiving of the Blessed Virgin (Luke, i. 46-55), and prayers. *Completorium* or *Compline*, 'the completing service,' belongs theoretically to 9 P.M., and is a supplication for protection during the night. It is always the same, consisting of the general confession, four unvarying psalms, a hymn, the *Nunc Dimittis* or Song of Simeon (Luke, ii. 29-32), prayers, and a Commemoration of the Blessed Virgin. The unchanging character of this and of the Little Hours conveys no idea of the practical monotony from day to day. This arises from the multiplication of festivals of saints already spoken of. These have, practically speaking, always got special psalms, which are always the same at lauds, and vary very little at vespers and matins. Hence, as a matter of fact, about fifty or sixty psalms are repeated constantly, and the others rarely or never.

The second part of the breviary consists of what is called the *Proprium de Tempore*. This means the whole service for Sundays and week-days as dependent upon Christmas and Easter. It contains the homilies of the Fathers, hymns, &c. for the whole year, as far as so dependent, but is

mainly occupied by the course of daily scripture-reading. This consists of selected extracts averaging about 20 verses a day. Roughly speaking, Isaiah is read in Advent (the three or four weeks preceding Christmas), the epistles of St Paul from the Epiphany (January 6) till Septuagesima (the ninth Sunday before Easter), when Genesis is begun, but broken off at chapter xiv. on Shrove Tuesday. Homilies, not Scripture, are read in Lent, except on feasts of saints, and then the Scripture is special, but Genesis continues to be read on Sundays, and a small portion of Jeremiah and Lamentations in the last fortnight. A week after Easter the Catholic Epistles and Apocalypse are begun and read till Whitsunday. A week after Whitsunday, Samuel and Kings are begun, and read till the beginning of August. At that date Proverbs are begun, and followed by Ecclesiastes, Wisdom, Ecclesiasticus, Job, Tobit, Judith, Esther, both books of Maccabees, and the rest of the Prophets. The weakness of this arrangement, besides the scantiness and scrappiness of the extracts, is in the omission of so much, including entire books and the greater part of the Pentateuch. It forms, however, a kind of imperfect epitome of scriptural history, and a limited course of scriptural reading.

The third part of the breviary consists of what is called the *Proprium Sanctorum*, or special offices of saints. This consists of whatever is special to any day fixed by the day of the month. The greater part of it as regards bulk is occupied by summaries of saints' lives, exactly like articles in a biographical dictionary. This is certainly the weakest part of the breviary, and is accordingly always selected as the point for controversial attack. Although sometimes drawn up with care and frequently altered—as was done by Leo XIII. among others—to keep them abreast of historical criticism, the biographical notices are open to the charge of occasional inaccuracies in matters of fact. A notion sometimes obtains among Protestants that Roman Catholics are obliged to believe these biographies. This is wholly baseless. No such idea exists even as a superstition. As these notices embrace the lives of a very great number of persons of religious eminence, of all nations, ages, and conditions, they form a sort of imperfect epitome of church history, just as the Scripture readings form one of Scripture.

The fourth part of the breviary is called the *Commune Sanctorum*. This is a series of twelve offices for festivals of saints according to the class to which he or she may belong. They are for (1) the eves of apostles; (2) the feasts of any martyrs, including apostles, within the season from Easter to Pentecost; (3) apostles and evangelists; (4) a single male martyr; (5) a group of several martyrs; (6) a canonised bishop not a martyr, technically styled *confessor*, as having confessed Christ before men, though not by death; (7) a confessor not a bishop—i.e. a priest or layman; (8) doctors of the church—i.e. certain eminent theologians, but this differs little from 6 or 7; (9) virgins, divided into martyred and not martyred—the latter are mainly canonised nuns; (10) other women; (11) dedication festivals of churches; (12) the Blessed Virgin Mary. The *Commune Sanctorum* is the most used of any part of the breviary. In fact, the service from day to day usually consists of 4, 6, 7, and 9, with occasional changes to 2, 3, 5, and 12. All these have special psalms, which differ little, 6, 7, and 8 being absolutely the same, as also 9, 10, and 12, and 2 having the psalms of 3, 4, or 5. The festal office is a good deal shorter than others, a circumstance which probably accounts for a good deal of its multiplication. There are three *Nocturnæ* at matins, with only three psalms in each. At the

end of the first are read the lessons from Scripture, which are usually those of the day from the *Proprium de Tempore*, as only festivals of some importance have special Scripture lessons; at the end of the second is read the biographical notice; at the end of the third, a homily on the gospel. These lessons of the third Nocturn, which are often most striking and powerful passages from the greatest writers of the early church, vary a good deal, and form, along with those of the *Proprium de Tempore*, a sort of imperfect epitome of theology, as those of the first Nocturn do of Scripture, and those of the second, of church history.

The fifth part of the breviary consists of extra services, the principal of which are the vespers (*placebo*), and matins, and lauds (*dirge*) of the dead, and the Little Office of the Blessed Virgin Mary. None of these extra services are ever obligatory, except that of the dead on All-Souls' Day. It is funereal in character, and is mainly used at funerals, anniversaries of deaths, &c. The Little Office of the Blessed Virgin is a sort of abbreviated festal office of the Blessed Virgin, with only one Nocturn. It contains 31 psalms daily, with 4 canticles, hymns, prayers, &c., and is very widely used by itself among the laity and the active religious orders.

Notwithstanding the weaknesses of its scriptural course of reading and its biographical notices, and the practical monotony caused by the multiplication of festal offices, the breviary forms a marvellous mine of powerful and tender religious thought, amassed by the devotional experience of ages. It must be remembered that at every separate service, nearly all, or by far the largest part of the matter used, is the language of Scripture, a circumstance which invests the office with great grandeur and vitality. The readings form a sort of storehouse, albeit imperfect, of scriptural, historical, and theological knowledge. Exquisitely chosen quotations or adaptations of Scripture also enter largely into what are among the most striking passages of the breviary—viz. the *Invitatories* or exhortations to worship joined to the *Venite*, the *Antiphons* or anthems attached to the psalms and canticles, the *Short Responsories* which precede the prayers at the little hours and compline, and above all, the responsories by which each section of the lesson at the end of each nocturn is followed. These are always poetical, generally beautiful, and not unfrequently rise to the sublime.

The rules for arranging the service for every day, and especially for uniting and harmonising the *Proprium de Tempore* with the *Proprium Sanctorum*, are contained in the general rubrics, and fill 37 chapters. Being printed in black, with the quotations and technical words in red, these pages present a motley appearance, which has obtained for them the technical name of the *Pica* or *Pie* (cf. *magpie*, *piebald*). The rules are so complicated that it would be almost impossible for any one to find the service for himself upon the spur of the moment, upon any given day. This difficulty is accordingly met by the publication in every separate country or diocese of a sort of annual almanac, called the *Ordo Recitandi Divini Officii*, which contains under every day, clothed in a mass of technical contractions, minute directions as to what is to be read.

The breviary is sometimes to be met with in one bulky volume, in which case it is called a *Totum*; sometimes, especially in Spain, in two; but most frequently in four, for spring, summer, autumn, and winter, in which case each volume contains the Psalms, a quarter of the *Proprium de Tempore*, about a third of the *Proprium Sanctorum*, and the whole of the *Commune Sanctorum* and the additional matter.

The duty of publicly joining in or privately reading aloud—i.e. so as to utter every word with the lips—the whole of the breviary services every day, is incumbent upon all clerks in holy orders, all members of religious orders, male or female, and every person holding a benefice (such as a prebend) to which attendance in choir is normally attached. The serving brethren or sisters in religious orders, and the members of active religious orders, such as sisters of charity, form an exception, but these are always bound to some shorter substitute, such as the Little Office of the Blessed Virgin, a similar office in praise of the Blessed Sacrament, or the like. In all properly conducted cathedral and collegiate churches, the service is performed publicly every day with surpliced choir, &c., as in similar institutions in the English Established Church; the ceremonial is also similar, except that, if the service is choral, incense is offered during the *Benedictus* and *Magnificat*. For this purpose the services are usually massed together, as matins and lauds at 7.30 or 8 A.M., prime, terce (after which high mass is sung), sext, and none, at 9.30 or 10, and vespers and compline at 4. The time consumed varies, principally according to the amount of music used. A person reading alone and pronouncing rapidly can read the whole of the services of the day through in about two hours, or even less. In the cathedral of Seville, on the other hand, where the entire daily service is sung with the utmost pomp and solemnity, and with the addition of generally two, often three, and sometimes four high masses, as many as eight hours are often spent in choir.

The use of the breviary as a book of private devotion by laymen has become rare since the invention of printing has led to the multiplication of devotional works of different kinds, but at present seems to show some tendency again to increase, and it has always been a common custom to sing vespers or compline, at least on Sundays, in parochial and other public churches. For this reason, most Roman Catholic manuals of devotion contain compline and the more common psalms of vespers. Spanish prayer-books usually contain the ordinary forms of all the services except matins; and in that country the singing of such services in the parochial churches, and the participation of the laity in them, is more common than elsewhere.

The Parisian breviary of 1737 was translated into French as the *Bréviaire Français*. There are French and German translations of the Roman breviary; and the Marquis of Bute, author of the preceding article, published an English version in 1879. See Mgr. Pierre Batiffol, *Histoire du Bréviaire Romain* (1893; trans. 1911); German works by Pleitner (1887) and Baumer (1895); and the Cambridge edition of Quignon's breviary, 1888.

Breviary of Alaric. See CODE.

Brevipennes (Lat., 'short-winged'), an obsolete name, applied by Cuvier to the running-birds like ostrich, rhea, and emu, in which the wings are rudimentary. See BIRD, OSTRICH, &c.

Brewer, JOHN SHERREN, born at Norwich in 1810, graduated with classical honours at Queen's College, Oxford, in 1833, took orders, and was appointed professor of English in King's College, London, in 1841. For nearly twenty years he laboured in the Record-office, editing the *Monumenta Franciscana* (1858); the *Opus Tertium* and *Opus Minus* of Roger Bacon (1859); vols. i.-iii. of *The Works of Geraldus Cambrensis* (1861); the *Calendar of the Carew Papers* (1861), with the aid of Mr Bullen; and vols. i.-iv. of the *Calendar of Letters and Papers, Foreign and Domestic, of the Reign of Henry VIII.* (1862-72). As an editor, Brewer possessed patient industry and a rare sense

of order, besides marvellously sound judgment and extensive knowledge. His essays and reviews in *English Studies*, edited by Dr Wace, with a brief biography (1880), reveal his vast knowledge and his broad sympathies, as well as a delicacy of touch and a fineness of literary insight seldom found in the laborious student. Brewer was elected Honorary Fellow of Queen's College in 1870, and in 1877 was presented to the living of Toppesfield, in Essex, where he died February 16, 1879.

Brewing. See BEER.

Brewster, SIR DAVID, an eminent Scottish natural philosopher, was born at Jedburgh, December 11, 1781. From the early age of twelve he was educated for the Church of Scotland at the university of Edinburgh, where he highly distinguished himself. A constitutional nervousness disinclining him for a clerical life, he became editor in 1802 of the *Edinburgh Magazine*, and in 1808 of the *Edinburgh Encyclopædia*, to which he contributed many important scientific articles. Previous to this he had entered deeply on the study of optics, with which his name is now enduringly associated. The beautiful scientific toy called the kaleidoscope was invented by him in 1816, and many years after he improved Wheatstone's cumbersome stereoscope by the introduction of lenses, and produced the lenticular instrument now in use. In 1819 the *Edinburgh Philosophical Journal* took the place of the *Magazine*; and in 1831 Brewster was one of the chief originators of the British Association. In 1815 he was elected a Fellow and Copley medallist of the Royal Society; in 1816 he received half the prize bestowed by the French Institute; in 1818 the Royal Society awarded him the Rumford gold and silver medals for his discoveries on the polarisation of light; in 1825 he became corresponding member of the Institute of France; in 1832 he was knighted; and had a pension conferred upon him; in 1838 he was appointed principal of the united colleges of St Salvator and St Leonard, St Andrews; in 1849 he was elected one of the eight Foreign Associates of the French Institute; he was also a member of the academies of St Petersburg, Berlin, Copenhagen, and Stockholm. In 1859 he was chosen principal of Edinburgh University, and filled this post until within a few months of his death at Allerly, Melrose, February 10, 1868. He made important discoveries in every branch of the great subject of polarisation, and in most departments of optics, dealt with optical illusions, the colour of mother-of-pearl, fringes of colour, the optical properties of innumerable substances, biaxial crystals, dichroism, the absorption of light, phosphorescence, fluorescence, photography, and the value of combinations of lenses. The most immediate practical result of Brewster's discoveries was the introduction to British lighthouses of the dioptric system, the honour of having elaborated which he shared with Fresnel. He resolutely maintained his own theory of the three primary colours, and never fully accepted the undulatory theory of light. It has been said that he wrote with the calm decision of a philosopher, the vivid imagination of a poet, and the fervour of a preacher. In 1822 he edited Legendre's *Geometry*, translated by Thomas Carlyle. His *Life of Newton*, first published in 1828 in the Family Library, was issued in a totally new and greatly enlarged form in 1855. Among his other works are his interesting *Letters on Natural Magic*, addressed to Sir Walter Scott; *More Worlds than One* (1854); his treatises on the Kaleidoscope and on Optics (*Cabinet Cyclopædia*); his *Martyrs of Science*; and his treatises in the 7th and 8th editions of the *Encyclopædia Britannica* on Electricity, Magnetism, Optics, the

Stereoscope, &c. He also contributed largely to the *Edinburgh* and *North British Reviews*, and communicated hundreds of papers on scientific subjects to the transactions of learned bodies and to scientific journals. See *Home Life of Brewster*, by his daughter, Mrs Gordon (1869).

Brezowa, a market-town of Czechoslovakia, 40 miles NE. of Presburg; pop. 6000.

Brian, a famous king of Ireland, the Brian Boróimhe or Boru ('Brian of the tribute') of the old Irish historians. He succeeded his elder brother as chief of the Dal Cais, on the murder of the latter in 976, and after much fighting, made himself king of Cashel two years later. After establishing his rule over all Munster, he marched into Leinster, and was acknowledged as king by its chiefs in 984. King Brian supported a rude but princely state at his chief castle at Cenn Coradh, near the modern town of Killaloe, and he had also seats at Tara and Cashel. He formed an alliance with Maelsechlainn Mac Domhnaill, chief king of Ireland, crushed with his help an outbreak of the Leinster men in 1000, next made terms with the Danes of Dublin, and with their help overpowered his late ally, compelled him to give him hostages, and thus made himself in theory chief king of Ireland. He next carried his conquering sword to the west, subdued the Connaughtmen, and in their turn the men of the north. After marching from Meath to Armagh, he made a circuit of Ireland, taking hostages from all the territories through which he passed. Thus he had become actual Ardrioh, or chief king of Ireland, and such he remained until his death. In 1013 war broke out again with the Danes of Dublin, who found some Irish allies. The great struggle took place at Clontarf, on the north side of Dublin Bay. The Danes were routed with great slaughter, never again to recover their strength in Ireland; but the aged hero perished in the battle, April 23, 1014. In his lifetime he had defeated the Danes in no less than twenty-five battles.

Briançon, CHARLES JULIEN, French mathematician, was born at Sévres in 1783. Besides some important papers contributed to French mathematical journals, he has left small treatises on lines of the second order (1817), and the application of the theory of transversals (1818). He is best known by a theorem, the correlative of Pascal's, which he published in 1806. The theorem is, If a hexagon is circumscribed to a conic, the straight lines joining the three pairs of opposite vertices are concurrent. He died in 1864.

Briançon (ancient *Brigantium*), a town in the French department of Hautes-Alpes, 162 miles NNE. of Marseilles by rail, on the right bank of the Durance, which is here spanned by a bridge of a single arch 130 feet wide. It is the highest town in France, being situated at an elevation of 4330 feet above sea-level. Pop. 5000.

Briand, ARISTIDE, a French lawyer, born at Nantes in 1862, conducted the bill for separation of church and state, and has been several times premier since 1909. Once an advocate of the general strike, he himself broke a strike in 1910 by calling the strikers to the colours.

Briansk, a trading-town of Russia, on the Desna, 72 miles W. of Orel, with iron and glass works, &c; pop. 30,000.

Briar. See ROSE; also BRIAR-ROOT.

Briare, a town in the French department of Loiret, on the Loire, 87 miles SSE. of Paris. The Canal de Briare (35 miles long), which unites the Loire and the Seine, was the first constructed in France (1642). Pop. 4500.

Briareus (also called *Ægæon*), the son of Uranus and Gæa, who, like his two brothers, had

a hundred hands and fifty heads. He fought for the gods against the Titans (q.v.).

Briar-root, a fine hard wood obtained from the roots of a species of very large heath (*Erica arborea*) which grows in the Pyrenees, in Corsica, and in Algeria. It is largely used for tobacco-pipes. The name is a corruption of the French *bruyère* ('heath'), and has nothing to do with *briar*.

Bribery, as a system affecting all social relations, forms in many countries, and especially among Oriental peoples, a serious difficulty for government, as well as in the conduct of business. In Great Britain the rules of the common law striking at bribery have been reinforced by a long series of statutes, and within recent times it cannot be said that there is any general corruption in either private or public life.

BRIBERY AT ELECTIONS.—During the 18th century parliamentary corruption was a serious abuse. Developed in the reign of Charles II., when king and ministers and opposition alike received bribes from Louis XIV., it was reduced to a system by Sir Robert Walpole, in whose day the votes of electors were regularly bought, and often those of members of parliament. Indirect considerations also, though not always expressed in money, seriously prejudiced appointments to the public service and the administration of justice. In all these matters, however, there is now something approaching to purity. Statutes were passed in 1729, 1809, 1842, and 1854. The committees of parliament never did justice to the petitions against returns obtained by bribery and other corrupt practices; and accordingly in 1868 the jurisdiction in such cases was given to the judges of the Superior Courts with the best results. The Ballot Act tended further to starve out the coarser forms of bribery, because of the uncertainty whether the money produced any result. Under the Corrupt Practices Act, 1883, and other statutes now in force for safe-guarding the purity of parliamentary and other elections, an important distinction is drawn between 'corrupt' practices, which imply guilty knowledge or intention, and 'illegal' practices, which may be done through mere ignorance or inadvertence. The offences included in the category of corrupt practices are: bribery, which, as defined in the Corrupt Practices Act, 1854, consists in offering or accepting a reward to influence a vote, whether the offer is made by the candidate or by any one else; treating, where the reward for voting, or for abstaining from voting, takes the form of food, drink, or other entertainment; undue influence, consisting in the use of force or threats of injury—e.g. a threat to withdraw custom from a tradesman with a view to influencing his vote; and personation, which is defined to mean applying for a ballot-paper in the name of another, or applying for a second ballot-paper when the voter has already voted. Personation, which also includes procuring any person to commit personation, is a felony, and renders the offender liable to imprisonment for two years. The other corrupt practices are misdemeanours, involving fines or imprisonment for one year. Further, a person convicted of any of these corrupt practices is excluded from all electoral rights, and all capacity for public office, for a period of seven years. The offences coming under the head of illegal practices are very numerous, including, e.g., the expenditure of money for conveying electors to the poll or for an excessive number of committee-rooms; the publication of false statements as to the withdrawal of a candidate; and, under an act of 1895, the making of false statements as to the personal character or conduct of a candidate. Any person committing such illegal practices during an election is liable,

on summary conviction, to a fine not exceeding £100. If the elected candidate, or his agent, is proved to have been guilty of corrupt or illegal practices, the election is void. Moreover, if it appears that such practices have extensively prevailed in a parliamentary constituency, the constituency may be deprived of its right to elect members to parliament. Under the Public Meetings Act, 1908, the interruption of political meetings during an election may amount to an illegal practice.

In England, by the Municipal Elections (Corrupt Practices) Acts, 1884 and 1911, and by the Local Government Acts, 1888 and 1894, the law as to bribery at municipal elections, as well as in county and parish council elections, is now substantially identical with the law as to bribery at parliamentary elections. Similarly, in Scotland, by the Elections (Corrupt Practices) Act, 1890, the law as to bribery in parliamentary elections was, with a few modifications, rendered applicable to municipal, county or parish council, and school board elections. In the United States acts have been passed in many states, on the same general lines as the English statutes, with a view to discourage corrupt practices at elections.

BRIBERY OF PUBLIC OFFICERS.—It is an offence at common law, both in England and Scotland, to give or offer a bribe to a public official with a view to unduly influence him in the performance of his duties, or for a public official to take such a bribe. The common law on this subject has been reinforced by the Public Bodies (Corrupt Practices) Act, 1889, passed 'for the more effectual prevention and punishment of bribery and corruption of and by members, officers, or servants of corporations, boards, commissions, or other public bodies.' Under this statute it is an offence, punishable by fine or imprisonment, (1) to corruptly solicit, receive, or agree to receive for oneself or for another, any gift, loan, reward, or advantage, as an inducement to, or reward for, any member or servant of a public body doing, or forbearing to do, anything in respect of any matter or transaction, actual or proposed, in which the public body is concerned; or (2) to corruptly give, promise, or offer any gift, loan, reward, or advantage to any person, whether for the benefit of that person or another, as an inducement to a member or servant of a public body to do, or forbear to do, anything in respect of any matter or transaction in which the public body is concerned. A person convicted under this statute is rendered incapable of holding any public office for seven years from the date of the conviction, and forfeits any public office held at the date of the conviction. Special provision has been made by various statutes against bribery in certain departments of the public service, in which the officials, in the performance of their duties, are peculiarly exposed to this form of temptation. Thus the Customs Consolidation Act, 1876, imposes special penalties for bribery in the case of custom-house officers; the Excise Management Act, 1827, in the case of excise officers; and the Inland Revenue Regulation Act, 1890, in the case of officers of inland revenue.

BRIBERY OF JUDGES.—In England the bribery of judges or judicial officers is a grave offence at common law. A judge who accepts a bribe is, in addition to other penalties, removed from office; and any one who gives or offers a bribe to a judge or judicial officer is punishable by fine or imprisonment. In Scotland the bribery of judges of the Court of Session and of inferior courts is anxiously provided against in a long series of old acts.

BRIBERY OF AGENTS.—The law on the subject of bribery received an important extension by the Prevention of Corruption Act, 1906, which has

brought the paying and receiving of secret commissions within the scope of the criminal law. The taking by an agent of a secret commission had, indeed, long been recognised as illegal. Thus it was well settled that the acceptance by an agent of any such commission justifies his dismissal without notice, and that the principal is entitled to recover the commission from the agent by action. But prior to the Act of 1906 the bribery of an agent did not, as a general rule, render either the agent taking, or the person giving, a bribe liable to the penalties of criminal law. By this act, which applies to Scotland as well as to England, it is made a criminal offence, punishable by fine, or imprisonment, or both, (1) for an agent corruptly to accept or obtain, or to agree to accept or obtain, from any person, for himself or another, any gift or consideration as an inducement or reward for doing, or forbearing to do, any act in relation to his principal's affairs or business, or for showing, or forbearing to show, favour or disfavour to any person in relation thereto; (2) for any person corruptly to give, or agree to give, or offer any gift or consideration to an agent for such an object; and (3) for any person knowingly to give to any agent, or for any agent knowingly to use with intent to deceive his principal, any receipt, account, or other document in respect of which the principal is interested, and which contains any false, erroneous, or defective statement intended to mislead the principal. The term 'agent' in the act includes a person serving under the crown, or under any corporation, or any municipal borough, county, or district council, or any board of guardians.

Brice, St, Bishop of Tours in the beginning of the 5th century, is commemorated as a confessor. *St Brice's Day* (November 13), in 1002 (in Ethelred's reign), is notorious in English history for a great massacre of the Danes. It was believed that it was a concerted attempt to exterminate all the Danes in England; but failing of its bloody purpose, it led to reprisals by the Danish king Sweyn.

Brick. The earliest examples of this branch of the ceramic art were doubtless the sun-dried

bricks of Egypt, Assyria, and Babylonia. Remarkable to say, many of these, which in a northern climate the frosts of a single winter would destroy, have been preserved for some 4000 years by the dry, warm atmosphere of those countries. Sun-baked bricks of ancient date are also found in the mud walls of old towns in India. They are still much used for walls of houses in Persia, but are there faced either with burnt bricks or with plaster of Paris. Kiln-baked bricks must have been the products of a later time; but they are found in all the chief ruins of ancient Babylonia, where they were often used to face or bind together walls of sun-dried bricks, and occasionally they were even ornamented with enamelled colours. Burnt bricks were employed in the foundations of the Tower of Babel (q.v.). These ancient bricks, whether baked by the sun or by fire, were all made of clay mixed with grass or straw. Most of the great ruins in Rome are built of brick, and the Romans appear to have introduced the art into England. Interesting historical information has been obtained from the impressions on Roman, and especially on Babylonian, bricks. Bricks of the modern or Flemish make were used in England in the 13th century. For the unburnt bricks of Texas, Mexico, and Central America, see ADOBE.

Manufacture of Bricks.—Clay suitable for the manufacture of common bricks is an abundant substance, but there is a great difference in the nature and quality of the clays found in various localities. The basis of clay consists of hydrated silicate of alumina, with a varying proportion of other mineral matters, chiefly free silica (sand), iron, lime, magnesia, and potash. Great advantage is derived from digging clay in autumn, and exposing it all winter to the disintegrating action of frost. The next process is that of tempering or mixing the clay into a homogeneous paste, which is done by passing it through mills, principally the pan-mill or the pug-mill (see fig. 2, MM). In making bricks by the old hand process, the shape is given by a mould either entirely of wood, or of wood faced with metal, and without top or bottom. A 'plane' is used to press in the clay, and to smooth the upper and lower surface of the brick.

Although hand-made bricks are still very common, yet machinery is now largely employed to produce them. Brick-making machines are of two leading kinds, one class of them being constructed to work the clay in a wet plastic state, the other class requiring it to be in a dry or half-dry con-

Fig. 1.—Brick-making Machine.

dition. Of the two sorts, the wet-clay machines are the simpler, but the dry-clay machines, by forcing the clay into moulds by strong pressure, shorten the process, as no time is required for drying them. The bricks so made, too, are not only of a

more perfect shape, but they can be moulded into any form, and may even be made ornamental at a very slight additional cost.

Fig. 1 will convey a good idea of the general plan on which most of the wet-clay machines work.

The machine is driven by steam, and the clay is fed by a hopper into the pug-mill, A, on the central shaft of which strong pugging blades are placed in a spiral manner. These prepare and force the clay out at the bottom, whence it passes over the carry-

made bricks. The time required for firing in ordinary kilns varies from 40 to 60 hours for common red and white bricks, while for some fire-bricks 150 hours are necessary. Where kilns are not used, bricks are burned in clamps, the clay requiring to be mixed up, in the process of tempering, with a quantity of ground coal sufficient to burn them. A good test of the character of a clay is obtained by the result of firing. The average contraction in the kiln for prepared clays is 7½ per cent. If a brick contracts much more than this, the clay is too fusible.

All brick clays contain iron, and the colour of a burnt brick almost entirely depends on the amount of it which is present; thus clays containing less than 1 or 1½ per cent. of iron change in the kiln to various shades of cream colour and buff, whilst those containing more than 2 per cent. range in colour from yellowish-fawn to dark red.

Blue bricks are made from the same clay as the red by controlling in a peculiar way the supply of air in firing, and by carrying the heat slightly further. It is asserted by some that the red is changed to the black oxide of iron in the process.

London Stock Bricks.—This is the common kind of brick used in and about London. Fine-sifted ashes and coal are mixed with the clay in its manufacture. It is of a yellowish colour, and very serviceable; but it is only the best qualities of it that are fit for the fronts of buildings.

Rubbers.—Norfolk and Suffolk red and white bricks are largely used for facings in the metropolis and elsewhere. Some kinds of these, as well as some 'malm stocks,' are soft enough to be rubbed true on the faces and beds for fine work, and they can even be carved.

Staffordshire Bricks.—For fineness of texture and uniformity of colour many bricks made in the pottery districts of this county are the best in England.

Glazed Bricks.—These are made of any desired colour on the face, which is imparted to the glaze. They are highly useful, not only for decorative purposes, but for passages, stables, and other places which require frequent cleaning.

Slate-bricks are made from the debris of slate-quarries. It has been ascertained that bricks composed of powdered slate are among the strongest kinds known.

Fire-clay Bricks.—Refractory clays are abundant in the coal-measures, some of fine quality being found about Newcastle and Glasgow, but the most celebrated is that of Stourbridge. The kinds containing least oxide of iron and alkaline substances make the best, because the most infusible, fire-bricks. Gannister bricks are of the most refractory description. They are made of a highly siliceous fire-clay, and used for steel furnaces (see FIRE-CLAY).

Composition Bricks.—In districts where the Carboniferous formation occurs, excellent building bricks are made of a mixture of fire-clay, shale, and common clay.

Dinas Fire-bricks.—These Welsh bricks are almost pure silica, and were long supposed to stand the high and long-continued heat of metallurgical and other furnaces better than any other known brick. They must not be placed near alkaline substances.

Bauxite Bricks, the most refractory of all fire-bricks, named from *Bauxite*, a clay from Baux,

Fig. 2.

ing rollers, C, to the pressing rollers, PP, which force it through a die at D, in a rectangular stream, S, so exactly shaped to the required size that nothing more is necessary than to cut it into single bricks by the wires, W. These are set in a rocking frame, which can be so adjusted as to cut the bricks on the square or at an angle; the one plan being adopted when the clay is at rest, the other while it is in motion. The figure shows what is called a single-ended machine. Some of these machines are provided with a pair of powerful crushing rollers, which reduce any hard lumps or stones before the clay enters the pug-mill. Hollow bricks and drain tiles are made by the same kind of machinery, with peculiarly constructed dies.

Fig. 2 shows a dry-clay machine by Messrs Bradley & Craven, Wakefield, which is considered an excellent one. The figure is a simplified diagram (vertical section) with only the principal parts shown. The machine comprises a mixer (not shown), a pug-mill, MM, a circular rotary moulding table, TT (more darkly shaded than the other parts), and a powerful press, P, worked by an eccentric, and moving in slides. The rotary table may have from twelve to twenty-four moulds round its periphery. In operation the clay is carried forward through the inclined mixer to the pug-mill, from which a pair of moulds (one only seen in figure at B) is directly under the operation of the pug-mill, the blades of which by their screw-like action compress the clay into the moulds. At each partial rotation of the table two pugged bricks are lifted out of the moulds (one seen at B'). These bricks are ejected by the lever, L, acting on the mould-pistons, XX'. Self-acting gear (not shown) delivers the two bricks under the press, one of which is seen at B''. One of the dies of the press, which are kept hot by steam, is shown at D ready to descend upon one of the bricks. After being pressed they are taken to the kiln.

The green bricks, after being carefully dried in a 'clamp' (open-air dryer) or in an artificially heated dryer, are baked in a kiln with a suitable arrangement of fires and flues. Kilns are of many forms, but all come under one or other of two groups—intermittent or single-chamber kilns and continuous kilns. Of the latter the most successful is the Hoffman kiln, consisting of several chambers connected to obtain the best effect of the fuel used (see POTTERY). In it the waste gases from the main firing are utilised to partially burn newly-

near Arles in France. They are composed chiefly of alumina and oxide of iron, with a little silica. The iron is reduced to the metallic state by the addition of a little plumbago.

Floating Bricks.—A diatomaceous earth called fossil meal, and consisting largely of silica, is used to make these curious bricks which float in water. They are made in Tuscany, and are very refractory, but wanting in coherence. A similar earth has been found in the Isle of Skye and one or two other places in Scotland.

American Bricks.—In the United States, bricks are as a rule of excellent quality. The face bricks of Philadelphia and Baltimore are equal to any made in other countries.

Bricklaying. In some countries, and in large provinces or over extensive areas of others, brick is the only available material for house-building. Not infrequently brick has to be resorted to even where stone abounds, if, owing to its hardness, the cost of working it is excessive, or if it be of a perishable nature, or has other faults which render it unfit for building purposes. Most of the towns of southern England, of Holland, and of north Germany are largely or almost entirely built of brick.

The standard size of English bricks being 9 inches by 4½, the thickness of walls is regulated thereby. They are either half-brick, 1 brick, 1½, 2, 3, or 4 bricks in thickness. In moderate-sized modern English houses the inside partition-walls are usually half-brick, the outer walls 1 or 1½. Modern brick houses are, for the most part, far less substantial than those erected by our forefathers. Building leases being usually granted for ninety-nine years, at the expiration of which term the whole property reverts to the freeholder, the object of the builder is merely to make a house that shall stand for that period, and not to expend any money for the sake of further stability. In laying the foundations of walls, the first courses should be thicker than the intended superstructure, and the projections thus formed, usually of quarter brick on each side, are called 'set-offs' (see FOUNDATION).

Mortar composed of lime and sand is the common cement for brickwork. It should be equally and carefully applied; and the bricks wetted, in order that the mortar may adhere more firmly, by being absorbed into their pores (see CEMENTS).

The most important thing in bricklaying is to see that the wall is properly bonded. The bricks of every course should cover the joints of the course below it, or, to use the bricklayer's phrase, the work must 'break bond.' A layer or stratum of bricks is called a *course*. Bricks laid with their lengths in the direction of the course, and their sides to the wall face, are called *stretchers*; those laid transversely, with their ends forming the wall face, *headers*; a layer of headers, a *heading course*; of stretchers, a *stretching course*.

The two kinds of bond almost exclusively used in England are the English and Flemish bond. English bond consists of alternate stretching and heading courses; Flemish bond, of a stretcher and header laid alternately in each course (see figures). English bond is the strongest, Flemish bond the more ornamental; and they are used accordingly. There are two other kinds of bond occasionally used for thick walls. In both, the centre of the wall is filled up with bricks laid diagonally, by what is called in the one case raking courses, and in the other herring-bone work. In order to strengthen the bond, bands of hoop-iron, tarred and sanded, are sometimes laid flatwise between the courses. This 'hoop-iron bond' has superseded the old practice of using bond-timbers. Walls of brick are frequently built hollow, and these dry quicker and perhaps more thoroughly than those

built solid. In such walls there is a thin outer and inner face of brick with hollow spaces between. Different ways are adopted for bonding or tying these walls. Hollow bricks are also used for walls, partitions, floor arches, and other work. Neat pointing of the joints often gives a very pretty appearance to brickwork.

Bricks of the ordinary rectangular shape are often used for arches, leaving the gaping interstices at the upper ends to be filled with mortar, or chips of brick. Such an arch cannot be strong. As the joints radiate to a centre, the arch bricks should be made of or cut to the proper

form, just as arch stones are cut to the right shape. In all kinds of bricklaying the walls should be built up level throughout, in order that the *settlement* may be equal, and evidently they should be quite vertical.

Bricklaying is measured by the rod or by thousand. A rod contains 272 square feet of standard thickness—that is, 1½ brick. This is equal to 306 cubic feet, and will, on an average, require 4500 bricks, allowing for waste. A cubic yard contains 384 bricks, and on an average 373 will weigh a ton.

Bricklaying in Frosty Weather.—Building during frost has for some time been carried on in Norway, in Sweden, in Germany, and in Britain also. Originally it was believed that the whole art lay in the use of unslaked lime. But in America bricklaying can be done satisfactorily in the open at a temperature of 16° F. by heating the sand and the water used in making the mortar.

Chromatic brickwork has been very extensively used in England, especially in the revival of the so-called English Gothic, or Venetian Gothic, in which the pointed arch, formed of coloured bricks, forms one of the prominent features (see TERRACOTTA).

Bride (O.E. *brýd*) alone denotes the newly-married woman; with the addition of the word *groom* (a corruption of O.E. *guma*, 'a man,' allied to Lat. *homo*), the newly-married man (O.E. *brýd-guma*). *Bride* has cognate forms in the other Teutonic tongues; *bridegroom* has parallels in Dutch *bruidegom*, Danish *brudgom*, Ger. *bräutigam*. *Bridal*, the marriage-feast, again, is for *bride-ale* (ale being a common name for a feast, seen in *leest-ales*, *scot-ales*, *church-ales*, *clerk-ales*, *bid-ales*, and *bride-ales*). Originally it meant merely the carousal or drinking in honour of the bride, and indeed *bride-ale* is still in the Cleveland dialect of Yorkshire the name given to the draught presented to the wedding-party on its return from church. See WEDDING.

Bride, St. See BRIDGET.

Bridewell, a well between Fleet Street and the Thames, dedicated to St Bride, which has given its name to a palace, parish, and house of correction. Bridewell was a formidable castle in the days of William the Conqueror, and a residence of early sovereigns. A palace described as 'a stately and beautiful house' was rebuilt here in 1552 by Henry VIII. for the reception and accommodation of the Emperor Charles V. and his

Old English Bond.

Flemish Bond.

retinue; and King Henry himself also often lodged here, as, for instance, in 1525, when a parliament was held in Blackfriars. In 1553 Edward VI. gave it over to the city of London to be used as a work-house for the poor, and a house of correction 'for the strumpet and idle person, for the rioter that consumeth all, and for the vagabond that will abide in no place.' Queen Mary having confirmed the gift, it was formally taken possession of in 1555 by the Lord Mayor and corporation. Thomas Dekker in one of his plays relates the story of Bidewell, though he transports it from London to Milan. The chief portion of the palace was destroyed in the great fire of 1666. The bridewell was afterwards used for other persons than the class above named, and at last became a place of punishment till its removal in 1864. Bridewell House (1874), on the hospital estate, served various purposes. The Royal Bidewell Hospital educates destitute boys and girls at King Edward's Schools, Witley and Southwark. See PRISON, REFORMATORIES; and book by O'Donoghue (1923).

Bridge, or BRIDGE WHIST, a game of cards for four players. It is simpler than Whist or the Russian *Vint*, both of which games it resembles. It made its appearance in London in 1894, and quickly superseded Whist at the clubs. It is now seldom played, its place having been taken by Auction Bridge (see below). In the following description of the game, an elementary knowledge of cards on the part of the reader is assumed. The players sit at a square table, the opposite players being partners. The cards are the ordinary pack of fifty-two. They have values as at Whist, ace being the highest of each suit, then king, queen, &c., down to the two or 'deuce.' The players cut for partners, the two who cut the two cards highest in value (in cutting, the ace is the lowest card) play together against the other two. The player cutting the lowest card has the choice of seat, and deals first. The turn to deal passes from right to

Fig. 1.

left. The figure shows the position of the players at the table. A and B are partners against Y and Z. The cards, after being shuffled, are cut by the player to the right of the dealer. They are dealt, face downwards, one at a time to each player in turn, beginning with the player to the left of the dealer. Thus each player receives thirteen—a 'hand.' When all the cards have been dealt, the dealer, after looking at his 'hand,' must (1) declare the trump suit, or (2) declare 'no trumps,' or (3) leave the declaration to his partner. In making his declaration, the dealer will naturally name his 'strongest' suit—the suit, that is, of which he holds the greatest number or the highest cards. If he hold few high cards in every suit, i.e. if his 'hand' be weak, he will leave the declaration to his partner. If his 'hand' be very strong in three or four suits, he will 'call,' i.e. declare, 'no trumps.' With a very weak—a hopeless—hand, he will declare spades as the suit of least value. The declaration should be made in as few words as possible, and without any qualifying phrase. 'Hearts,' 'No trumps,' 'I leave it to you, partner,' is all that is necessary. Such phrases as 'I will try hearts' or 'I shall have to leave it' are against the etiquette of the game. If the dealer leave the declaration to his partner, the latter must (1) declare the trump suit, or (2) declare 'no trumps.' When the declaration has been made, the player to the left of the dealer, *before playing a card*, has the right of doubling the stakes for that hand. If he do not exercise that right, he says to his partner, 'May I play?' His partner then has the

right to double the stakes. If he do not exercise that right, he says, 'If you please,' and the play begins. (These and other necessary phrases in the game should be used invariably.) If either of the opponents double the stake, the dealer and his partner have, in turn, the right to redouble. The opponents have then the right, in turn, to double again (the opponent who first doubled has, first, the right to double again), and so on, but the doubling must cease before the value of the trick exceeds one hundred points. If the 'call' have been doubled, and the caller and his partner do not wish to redouble, they say, in turn, 'Content,' and the play begins. The player to the left of the dealer leads to the first trick—i.e. he places one of his cards, face upwards, on the table. B, the dealer's partner, then places all his cards, i.e. his 'hand,' face upwards, on the table, and does not take any further part in the play of the hand. A (the dealer) then plays one of B's cards. Z follows with one of his cards, and A completes the 'trick' by playing one of his own cards. A 'trick,' therefore, is the four cards played one from each hand in turn. Every player must 'follow suit' to each trick—i.e. he must play a card of the suit led if he have one. If not, he may (a) trump the trick, i.e. play a card of the trump suit; (b) discard, i.e. play a card of another suit. The trick is won by the side which has played the highest card of the suit led, or the highest trump. Any card of the trump suit will beat any card of another suit. The player whose card wins a trick 'leads,' i.e. plays first to the next trick. When the thirteen tricks have been played, the number won by each side is counted, and points are scored by whichever side has won more than six tricks. Each trick over six counts two points when spades were trumps; four points when clubs were trumps; six points when diamonds were trumps; eight points when hearts were trumps; twelve points when the declaration was 'no trumps.' A game is finished when either side has scored at least thirty points for tricks, but play continues until one side has won two games, i.e. 'the rubber.' Suppose that A (the dealer) have declared spades trumps, and that he, together with B's hand, have won eight tricks out of the thirteen, A and B score four points—two for each trick over six. Suppose that A have declared 'no trumps,' and that Y and Z together have won

nine tricks, Y and Z score thirty-six points—twelve for each trick over six. When the hand is played, the score is marked on a sheet ruled in columns, one for each side, and divided by a horizontal line. A printed form, sold by all stationers, is most convenient, and is generally used. The points scored for tricks are marked *below* the horizontal line, as they are the only points which count towards the game.

When either side has won two games, all the points scored are added up, the stakes are paid by the losing side, the players cut again for partners, and begin a new game.

Besides the points scored for tricks, there are others which may now be enumerated:

A & B.	Y & Z.	A & B.	Y & Z.

Fig. 2.—Bridge Scoring Sheet.

Honours.—These are the ace, king, queen, knave, and ten of the trump suit. (In a 'no trumps' declaration the honours are the four aces.) They are counted for every hand. Simple honours, i.e. any three honours held by one side, count twice the value of the trick. Thus, if diamonds be trumps, and A and B together hold any three honours in that suit, they score twelve points. If either side together hold four honours, they score four times the value of the trick. Thus, if hearts be trumps, and Y and Z together hold any four honours in that suit, they score thirty-two points. If a player hold four honours in his own hand, his side scores eight times the value of the trick. If either side together hold all five honours, they score five times the value of the trick. If either side together hold all five honours, and one of them hold four honours in his own hand, they score nine times the value of the trick. If there are no trumps, the side which holds together three aces scores thirty points; and the side holding together four aces scores forty points. If any player hold four aces in his own hand his side scores one hundred points.

Chicane.—If a player hold no card of the trump suit his side scores twice the value of the trick.

Slam.—If either side win twelve out of the thirteen tricks in the hand, they score twenty points for *Little Slam*. If either side win all thirteen tricks in the hand, they score forty points for *Grand Slam*.

Rubber Points.—When either side has won two games they score one hundred points for the rubber. The scores for honours and chicane are computed on the original values of the tricks, and are not affected by any doubling after a declaration has been made.

Table of Bridge Scores.

	Trump Suit.				
	Spades	Clubs	Diamonds	Hearts	No Trumps.
For every trick over six	2	4	6	8	12
Simple honours (3) ..	4	8	12	16	..
Four honours	8	16	24	32	..
Four honours in one hand	16	32	48	64	..
Five honours	10	20	30	40	..
Five honours, four being in one hand ..	18	36	54	72	..
Three aces	30
Four aces	40
Four aces in one hand	100
Chicane	4	8	16	32	..

Little Slam... 20 points. | Grand Slam . 40 points.
Rubber... 100 points.

The scores marked on fig. 2 are explained as follows:

First Hand.—A (the dealer) declares spades trumps, and holds the ace and queen. His partner (B) holds the knave and ten. A and B win nine tricks, and therefore score six points (3×2) below the horizontal line. They score also eight points for their four honours above the horizontal line.

Second Hand.—Y (the dealer) declares 'no trumps.' B says to his partner, 'May I play?' A replies, 'I double "no trumps."' Y and Z in turn say, 'Content.' Y and Z win four tricks, so that A and B win nine and score seventy-two points ($12 \times 2 \times 3$). Y and Z, however, held between them three aces, so score thirty points above the horizontal line. A and B have won the first game.

Third Hand.—B's deal. He leaves the declaration to his partner, who calls hearts. Y and Z do not double. A and B win seven tricks = eight

points. They hold between them all five honours (three in A's hand and two in B's), so score forty points above the line. Y had no hearts in his hand, so Y and Z score sixteen points for chicane.

Fourth Hand.—Z's deal. He declares diamonds, and his side win all thirteen tricks = forty-two points (7×6). Z held all five honours in his own hand, so that Y and Z score seventy points for honours and forty for the grand slam. Y and Z have won the second game.

Fifth Hand.—A's deal. He declares hearts. A and B win ten tricks = thirty-two points. A held three honours, B having none, so A and B score simple honours = sixteen points. A and B have won the third game and the rubber with a total of 182 points. To this they add 100 rubber points, making their total score 282 points. Y and Z have scored a total of 198 points, which, subtracted from 282, leave 84. If the stakes had been halfpenny points Y would pay to A 3s. 6d., and Z would pay to B 3s. 6d. It will be gathered from the above description that it is possible for one side to win the rubber and yet lose on points. This happens, as a matter of fact, not infrequently.

An elaborate series of Bridge rules has been compiled and adopted by authority of the Portland Club. They are too long to be given here, but are set out at length in most text-books. For instruction and advice on calling and on the play of the hand, the tyro is recommended to the guides by W. Dalton, 'Hellespont,' and the Bridge Manual of John Doe. In all treatises upon the game an elementary knowledge of Whist is postulated.

AUCTION BRIDGE.—A game of cards for four players; a variety of Bridge, which it has now superseded. The differences between the two games are in the methods of declaring and scoring. In Bridge the declaration must be made by the dealer or his partner; in Auction all four players compete in turn for the declaration. The points scored for tricks, honours, &c. are in most cases higher than at Bridge, so that the stakes are fixed usually on a lower scale. Auction at 1s. per 100 points is about equal to Bridge at 2s. 6d. Since its introduction many changes have been made in the game, and even now frequent suggestions are made for its alteration and improvement. The beginner should study the article on 'Bridge' above, as with knowledge of that game Auction will not present any difficulty.

Description of the Game.—The players cut for partners, and deal in turn as at Bridge. The dealer has first the right to declare, and the right to declare passes to each player in turn from right to left. Each declaration must, of course, exceed the previous one, and the play of the hand does not begin until competition ceases—i.e. until a declaration has been accepted by the other three players. As at Bridge, points are scored for each trick over six that is gained. When clubs are trumps, six points; when diamonds are trumps, seven points; when hearts are trumps, eight points; when spades or 'lilies' are trumps, nine points; when the call is 'no trumps,' ten points. It is obvious, therefore, that the call 'one diamond' exceeds the call 'one club,' the seventh trick when diamonds are trumps scoring seven points, against six points for the seventh trick when clubs are trumps. The call or declaration is, in fact, an engagement by one player to win with his partner a certain number of tricks in excess of six. 'One club' means: Clubs being trumps, my partner and I together engage to win seven tricks. If a player do not wish to compete for the declaration when his turn comes, he says 'No,' and the right to declare passes to the player on his left. Saying 'No' or 'Passing,' however, does not prevent a player competing if the turn comes round to him

again. The value of a declaration is assessed by the points it represents, 'one club' or six points being the lowest, and 'seven in "no trumps"' or seventy points the highest. If the points be equal the declaration involving the greater number of tricks is the higher. Thus, the declaration 'three clubs' or eighteen points is higher than 'two spades,' which is also eighteen points. The declarations in order of value are: One club; one diamond; one heart; one spade (spades are sometimes called 'lilies' or 'royal spades'); one 'no trumps'; two clubs; two diamonds; two hearts; two spades; three clubs; two 'no trumps'; three diamonds; three hearts; four clubs; three spades; four diamonds, and so on. In this connection an important rule should be noted: Each declaration must be higher than the preceding one. If a mistake be made, the player at fault must amend his declaration without changing the suit. For instance, A has declared 'two spades'; Y declares 'two hearts,' which is lower in value. Y must increase his declaration in hearts so as to make it better than 'two spades.' He must call, at least, 'three hearts,' and his partner, moreover, may not make another declaration unless the opponents do so. A declaration may be doubled as at Bridge, and the declaring player and his partner in turn have the right of redoubling. No further increase of the stake is permitted. The doubling of a declaration does not affect its value in competition with other declarations. If A call 'one spade' and Y double, B may call 'one "no trumps,"' or may make any other declaration involving more than nine points. The whole method of calling may be illustrated by a practical example: A, having dealt all the cards, looks at his hand and calls 'one diamond'; Y, the player on his left, calls 'one heart'; B calls 'no trumps'; Z says 'No'; A says 'No'; Y calls 'two hearts'; B says 'I double two hearts'; Y says 'Content'; Z says 'Content'; A calls 'three diamonds'; Y says 'No'; B says 'No'; Z says 'No,' and the game begins. Diamonds are trumps, and A and B between them are engaged to win at least nine out of the thirteen tricks. Once a declaration has been passed by the other three players, the game proceeds exactly as at Bridge, the player to the left of the caller playing first to the first trick. (Note in this connection that 'the caller' is the first caller of the accepted suit. If A call 'one diamond,' and, later, his partner B call 'three diamonds' and have the call, Y must play first to the first trick since A was the original diamond caller.) When the hand has been played, points are scored as at Bridge for tricks, honours, &c., but on a higher scale and in a different manner.

A Bridge scoring-form is used, but only the points gained for tricks by the declaring side are scored below the horizontal line. If the declaring side do not carry out their declaration, i.e. do not 'make their contract,' the other side score above the line fifty points for every trick short. Thus, if Y declare 'three clubs,' and he and his partner win seven tricks, they would be two tricks short or 'shy,' and A and B would score one hundred points above the line. If Y and Z had made their contract—had gained nine tricks—they would have scored eighteen points below the line. If the declaration have been doubled, the declaring side, if they make their contract, score double the ordinary number of points below the line. They also score above the line fifty points for making their contract and a further fifty points for every trick they gain in excess of their contract. Similarly, if the declaration have been doubled and redoubled, the declaring side, if they make their contract, score four times the ordinary number of points below the line, and score also above the line one hundred points for the contract and one hundred points for every addi-

tional trick they gain in excess of it. If the declaration have been doubled and the declaring side do not make their contract, the other side score above the line one hundred points for every trick short, or two hundred points if the declaration have been redoubled. For example, B declares 'three spades,' and is doubled. A and B gain ten tricks. A and B score seventy-two points below the line and one hundred points above, i.e. fifty points for their contract and fifty points for one trick in excess of it. Again, if B declare 'four clubs' and be doubled, and A and B gain six tricks only, i.e. are four tricks 'shy,' Y and Z score four hundred points above the line. The game is ended when either side have scored at least thirty points below the line, and the winning of two games by either side constitutes the rubber, as at Bridge. Honours are reckoned as at Bridge, and points are scored for them according to the original value of the trick (see table). The points scored for honours are not affected by any doubling; thus, simple honours in spades count eighteen points even though the declaration of spades may have been doubled or redoubled. Points for Chicane are scored as at Bridge. Grand Slam and Little Slam are reckoned as at Bridge, but higher points are scored.

Table of Scores at Auction Bridge.

	Trump Suit.			
	Clubs	Diamonds	Hearts	Spades
Each trick above six counts.	6	7	8	9
Simple (8) honours count...	12	14	16	18
Four honours count...	24	28	32	36
Four honours in one hand count.....	48	56	64	72
Five honours count.....	80	95	110	125
Five honours (four in one hand) count.....	54	68	82	96
Five honours in one hand count.....	60	70	80	90
Chicane counts.....	12	14	16	18

When the declaration is 'no trumps'—

Each trick above six counts..... 10.
 Three aces count 30.
 Four aces count..... 40.
 Four aces in one hand count.....100.

Whatever be the declaration—

Little Slam counts..... 50.
 Grand Slam counts 100.
 Rubber counts 250.

Only points gained for tricks by the declaring side are scored below the horizontal line—i.e. they are the only points which count towards the game. A higher score includes a lower—i.e. the one hundred points for Grand Slam include the fifty for Little Slam; five honours in one hand in spades score ninety only; no additional points are scored for four or simple honours.

Literature.—The following text-books may be studied with advantage: *Royal Spades*, by Bascule; *Auction Bridge up to Date*, by W. Dalton; *Auction Bridge under the New Rules*, and *Master Auction*, by Florence Irwin; *Foster on Auction*.

Bridge (A.S. *bryeg*; Dutch *brug*; Ger. *brücke*) is a structure raised over a river, canal, road, valley, chasm, or other impediment, to connect the opposite sides, and form a passage across. To speculate on the absolute origin of bridges is unprofitable. The simplest, and no doubt the earliest, form of bridge is that by which a stream was crossed by laying a tree on two piles of stones, or on the banks, at opposite sides. The next step was probably a development of the simple log into a system of cantilever bridge, which afforded means of greatly increasing the span, as has for centuries been prac-

tised by Japanese bridge-builders. For spanning a stream of considerable width, they would lay two balks of timber, imbedding one in one bank, and the other in the other bank, with their ends projecting over the stream, so as to form two cantilevers, and would then add a centre balk reaching across from one to the other. A good bridge of this kind was one constructed across the mountain-stream flowing through Nikko, which, although it was built two hundred years ago, is known as the 'temporary bridge,' to distinguish it from the more elaborate structure crossing the stream near it, which has its approaches closed against all but imperial and aristocratic travellers. There is an ancient Indian cantilever bridge across the Sutlej, the side beams of which, 100 feet in length, are imbedded to the extent of 50 feet in the masonry of vertical abutments, leaving 50 feet projecting. On their ends rest a centre beam, with which the span is made up to about 200 feet.

But the skilful and intelligent construction of a permanent bridge, with a large number of blocks of stone, in combination, held together mainly by the force of gravitation, was a problem of another order: apparently outside the scope of the Greek forms of constructive design, when the people of Athens crossed the Cephissus by wading or ferrying. But it was thoroughly grasped by the practical genius of the Romans, to whom, by general consent, the adoption of the arch as a constructive feature in works of architecture and of engineering is attributed. The Roman bridges generally consisted of a level road supported on one or more semicircular arches, exemplified in the Ponte de Rotto, or Senators' Bridge (fig. 1), erected

Fig. 1.—Ponte de Rotto.

by Caius Flavius, 127 B.C.—probably the first instance of the application of the arch in bridge design. The most remarkable bridge of antiquity was built by Trajan across the Danube, near Warkel, in Hungary, 4500 feet in length, 60 feet wide, consisting of twenty arches having a span of 170 feet, and 150 feet high from the foundations, constructed of squared stones. It was afterwards destroyed by Adrian, moved by jealousy probably, on the pretext that it would afford a passage for the barbarians into the empire. Some of the piers remain visible. The next considerable Roman work of this kind is the Pont du Gard, built in three stages, serving the double purpose of a bridge over the Gardon, and of an aqueduct for supplying the population of Nîmes with water. The bridge is 465 feet in length, and consists of six arches, which support a second series of arches, eleven in number, continued at each end to join the sloping sides of the mountains; and over these a third series, of thirty-five arches, much smaller than the lower arches, 850 feet in length, supporting a canal on a level with the mountains, 190 feet above the river. This unique structure was built with very large stones, worked with perfect accuracy to the required forms, and held together by iron cramps, without cement. It continues in a good state of preservation.

The semicircular arches of the ancients were succeeded by pointed arches, generally of small span; whilst in those of modern date the arches have generally been segmental—i.e. a segment of a circle less than a semicircle—or semi-elliptical. The

segmental and elliptical forms are in general much the more suitable, as they combine wide spans and free waterway with moderate elevation. But they incur a much greater lateral thrust on the piers and abutments than the semicircular arch, which must of course be provided for in proportioning the form and mass of the supporting elements.

The Gothic 'triangular' bridge of Croyland, more

Fig. 2.—Croyland Bridge in 1790.

properly 'trefoil' or three-way bridge (fig. 2), now usually called 'Trinity Bridge,' was built apparently about 1880 by the then abbot of Croyland in Lincolnshire (q.v.). It was erected at a point where a branch from the main stream of the Welland (1½ mile distant) divided into two smaller branches; and its three arches provided for three watercourses and three roadways. But it could never have been intended for heavy traffic, as it is too steep and too narrow for any vehicle. In 1854 the stream passing beneath, then become a common sewer, was arched over; and the bridge is now high and dry. On three piers or abutments arranged in a circle at the apices of an equilateral triangle, three semi-arches rise and meet in the middle—every two semi-arches balanced by the third. The longest bridge built in England in medieval times, was that over the river Trent, at Burton in Staffordshire, erected in the 12th century, of freestone, consisting of thirty-six arches, and 1545 feet long. It was superseded by a new bridge in 1864.

One of the most interesting bridges in the world is the bridge over the Taff, on the road from Llantrissant to Cardiff and Merthyr, which crosses the Taff at the village of Newbridge. It is named the 'Pont-y-tu-Prydd,' or Pontypridd, which means literally 'bridge by the earthen house,' derived from a mud hut that stood near the site. It was first determined to erect a bridge at a spot lower down the river; and William Edwards, a country mason, undertook the work, which was commenced in 1746. The bridge consisted of three arches; but two years and a half after it was finished, it was swept away during one of the great floods to which the Taff, like other rivers in mountainous districts, is subject; the water rising to so great a height as to flow over the parapet. Edwards, to guard against the danger which led to the destruction of the first bridge—the obstruction of the channel by the piers—conceived the bold design of spanning the river with a single arch of 140 feet span. The second bridge had barely been completed, when by another, but very different accident, the bridge fell like its predecessor. The quantity of material in the centre of the arch was so limited in proportion to that laid over the spandrels or haunches, that the deadweight on the haunches forced up the crown of the arch; and, again, the whole was reduced to ruins. After this second failure, most men would have relinquished the attempt. Not so with Edwards, who, per-

severing and ardent, determined on a third effort to overcome the difficulty. He rebuilt the bridge in conformity with the second design of a single arch; and profiting by experience, he adopted the precaution of greatly reducing the deadweight on the haunches, by making in each spandril three through transverse cylindrical openings, from face to face of the bridge; and, in addition, he filled the internal spaces between the faces with charcoal, a material weighing not more than one-fourth of rubble stone, bulk for bulk. By this means, a permanent structure, finished in 1750, was reared, which has now lasted nearly 150 years. The arch is a segment of a circle; it measures 140 feet wide between the abutments, as already stated, and has a rise of 35 feet. The arch is not parallel faced, but is 14 feet 5 inches wide at the crown, widening to about 16 feet wide at the springing, or the abutments. This expanding form is an element of stability. The roadway is 11 feet wide at the crown. From the great rise of the arch, the roadway over it was uncommonly steep and even dangerous; and about 1830, the roadway was raised at each end, and the surface was paved. But even now it is so steep—the inclination being at the rate of 1 foot rise in 4 feet horizontally—that it is found necessary to use a chain and drag, so that when a carriage reaches the centre of the bridge, one end of the chain is attached to the hindpart of it, the other end being secured to the drag, upon which a boy generally places himself, so that as the carriage descends upon one side, the drag is pulled up on the other side, and thus relieves the horse in descending. Edwards erected several other bridges in South Wales. With the occupation of a mason he combined that of a Methodist minister, having preached for upwards of forty years at White Cross Chapel, in his native parish.

The nature of the arch, with definitions, has already been noticed in the article *ARCH*. Each stone of an arch is acted on by three forces, one of which, its proper weight plus the weight of the load above it, is vertical. The second and third, the pressure of the two contiguous stones upon it, are perpendicular to the surface of contact with these stones. The nature of the stress everywhere is essentially compressive—that is to say, every individual stone acts and reacts by simple pressure—the result of gravitation. When every portion of the arch is equally stressed, no part tending to yield before another, it is in a perfect state of equilibrium. But, as says the old proverb, 'an arch never sleeps'—always ready for a fall—and if too great a load be placed on the crown of the arch, it will open outwards at the haunches, and sink inwards at the crown. If, on the contrary, there be a deficiency of weight at the crown, the crown will open upwards, and fall in at the haunches, as happened in the case of the second Pontypridd.

It is readily conceived that the higher the rise of the arch in proportion to the span, the less intense proportionally is the stress in its component parts, the less injurious is any slight inaccuracy of workmanship or design likely to prove, and the easier is the work of construction. But the inconvenience of the steep slopes resulting from a great proportionate rise of the arch, in situations where the approaches are low, has enforced the adoption of the lowest practicable rise and a low elevation of the roadways of bridges—segmental or semi-elliptical in form, as before stated.

The celebrated Grosvenor Bridge over the river Dee at Chester (fig. 3) supplies a fine example of a segmental arch of large span. The old bridge connecting Chester with a suburb, Handbridge, first noticed in the 13th century, is recorded to have fallen down or

been carried away twice. The third erection was of stone, in 1280, consisting of seven arches, pointed Gothic, supported on huge piers or buttresses. The old bridge has been aptly described by Ormerod, as 'a long fabric of red stone, extremely dangerous and unsightly, and approached by avenues to which the same epithet may be safely applied.'

Fig. 3.—Grosvenor Bridge.

The new bridge was designed by Mr Harrison, a local architect. It consists of one arch of 200 feet span, and 42 feet of rise—a segment of a circle of 140 feet radius. The total length is about 345 feet, and the clear width of roadway is 33 feet. It is below the old bridge, and stretches from the rock below Chester Castle towards the village of Overleigh. The abutments are founded on the solid rock, except where a fault occurs from the rock dipping almost vertically, at the back part of the north end, and where filling was necessary. So soft was the material with which the fissure was filled, a kind of quicksand, that the piles went down 5 or 6 feet at a blow for a considerable depth. A floor of stone was laid on the head of the filling, and the abutment was built upon it. The arch stones are 4 feet deep at the crown, and gradually increase to 6 feet at the springing. The radiating courses of stones on the principle of the arch is carried through the abutments, even down to the foundations; and the rock itself becomes the actual abutment as shown in fig. 4. The bridge was constructed of native sandstone, excepting the faces of the abutment and the first two courses of the arch, which are of granite.

The centering (fig. 4) on which the stupendous arch was raised consisted of six ribs in width of fir timber. The span of the arch was divided into four spaces by means of three nearly equidistant piers

Fig. 4.—Centering of Grosvenor Bridge—Half Length.

of stone built in the river, from which the timber spread fan-like towards the soffit or under face of the arch, where they were bound together with thick planking bent round to the curve of the arch. On the rim thus formed, the lagging or covering to form the bed on which the stones were laid was supported over each rib by wedges, by means of which the bed could be adjusted to the true curve, and which were driven out when the bridge was completed in order to remove the centering. The framing of the centering was composed entirely of whole and half timbers, from 22 to 36 feet in length; and, in all, the centre used up 10,000 cubic feet of timber. The effectiveness of the system adopted was proved by the circumstance that half of the arch was turned before the centre was finished; and that on its removal, the crown of the arch sank only from 2½ inches to 2¾ inches,

the joints remaining perfectly close, and no derangement of form, or of 'spaulching' or cracking being perceptible. The cost of the centering did not exceed £500.

The Grosvenor Bridge was constructed in the course of five years, and was opened in 1832. The total cost of the work was £49,900, which included a sum of £7500 for the embankment forming the approaches, or £145 per lineal foot.

The Adolphe Bridge in Luxemburg is a masonry bridge with an arch having a span of 278 feet, the longest built up to the present date. The arch has a rise of 138 feet above the river.

John Rennie led the way to the adoption of semi-elliptical bridges. His first important bridge—across the Tweed, at Kelso—opened in 1803, consists of five semi-elliptical arches of 72 feet span, with a rise of 28 feet, and four piers 12 feet thick, with a level roadway $23\frac{1}{2}$ feet wide between the parapets, and 29 feet above the ordinary surface of the river. The foundations were laid on solid rock. The piers and abutments are ornamented with three-quarter columnar pilasters of the Roman-Doric order, surmounted by a plain block-cornice and balustrade of the same character. Kelso Bridge, as Dr Smiles observes in his *Lives of the Engineers*, may be regarded as the model of the greater work by the same engineer—Waterloo Bridge. It was, he adds, one of the first bridges in this country constructed with a level roadway, contrasting vividly with the old-fashioned bridges, sloped like the roof of a house, as, for instance, the Pontypidd already noticed.

Waterloo Bridge, across the Thames, designed by John Rennie, has a level roadway, carried on nine equal semi-elliptical arches, of 120 feet span each, and 32 feet rise, leaving a clear height of 30 feet above high-water spring-tides. It was built of granite, in a style of solidity and magnificence previously unknown. Inverted arches were built between the elliptical arches in order to counteract the lateral pressure. The elliptical arch was carried to a greater extent of flatness than in bridges previously built. Isolated cofferdams upon a great scale, in a tidal river, with steam-engines for pumping out the water, were employed in the building of this bridge, for the first time, it is believed, in Britain. The length of the bridge between the abutments is 1380 feet, and the width between the parapets is 42 feet 4 inches. The long inclined approach on the Surrey side is formed by a series of thirty-nine semicircular arches of 16 feet span, besides an elliptical arch, of 26 feet span, over the Narrowwall Road, and an embankment 165 yards long, on an inclination of 1 foot rise in 34 feet of length. The total length of the bridge, with approaches, is 2456 feet, or nearly half a mile.

Fig. 5.—Centering of Waterloo Bridge.

The bridge was finished in 1817. The centering employed in the erection of the arches is illustrated by fig. 5, and is an excellent example of centering supported at the piers. It may be observed that the loads on the upper face of the centering are

resisted by oblique struts passing to the right and to the left, finally taking their bearing on the base of the piers. At each of the points *c, e, g, &c.* a pair of oblique struts is placed to take the thrust, one of them resting on a pier, the other lodged in the central shoe, *k*, and opposed by the corresponding strut from the other half of the arch. When the centres were struck, the sinking of the arches did not exceed from $2\frac{1}{2}$ to $3\frac{1}{4}$ inches at the crown.

New London Bridge (fig. 6), across the Thames, was built 180 feet higher up the river than the old bridge. It consists of five semi-elliptical arches, the least of which is wider than any other elliptical arch ever before erected. The centre arch has $152\frac{1}{2}$ feet span, with $37\frac{1}{2}$ feet rise; the next two arches are of 140 feet, and the two abutment arches are of 130 feet span. The roadway is 52 feet wide. The clear waterway at all times of the tide is 692 feet, or 60 feet more than the old bridge afforded at high-water. The whole length of the bridge is 1005 feet. At the City side the bridge is carried

Fig. 6.—London Bridge—Half Length.

over Thames Street on a dry arch. At the Borough or south side the approach is formed on an inclined plane, supported on a series of brick arches, with a large dry arch facing Tooley Street. This bridge deserves further remark for the difficulty of the situation in which it was built, above the old bridge, in a depth of from 25 feet to 30 feet at low-water, on a soft alluvial bottom, covered with large, loose stones, scoured away by the force of the current from the foundations of the old bridge. The whole of these stones had to be removed by dredging before the cofferdams for the piers and abutments could be commenced; otherwise it would have been extremely difficult, if not impracticable, to have made them watertight. The difficulty was further increased by the old bridge being left standing, to accommodate the traffic whilst the new bridge was building, and the restricted waterway of the old bridge occasioned such an increased velocity of the current as materially to retard the operations of the new bridge. At times the tide threatened to carry away all before it; and it was found expedient that two of the small arches of the old bridge on each side should be thrown into one, to compensate for the additional obstruction which the water occasioned to the navigation. The piers and abutments stand upon platforms of timber, the floors of the cofferdams resting upon piles about 20 feet long. The masonry is from 8 feet to 10 feet below the bed of the river. The great magnitude and extreme flatness of the arches, of which the keystones are 4 feet 9 inches long, demanded unusual care in the selection of the materials, which were of the finest blue and white granite from Scotland and Devonshire, as well as great accuracy of workmanship. The new bridge was opened for traffic in August 1831, the period occupied in its erection, from the time of driving the first pile for the dam of the south pier, being seven years, five months, and thirteen days.

Between 1902 and 1904 a scheme for widening the bridge was carried out, the footways being now carried by granite corbels. The present width of roadway is 35 feet, and each footway has a width of 15 feet, making the total width between the parapets 65 feet.

In the following table are given the leading dimensions of the largest stone arches that have been built for common roads, from 150 feet of span upwards:

Name	River	Form	Span	Rise	Keystone	Date	Engineer.
Clair (Grenoble) . . .	Drac	Circular	feet 150	feet 54	ft m 3 1	1611	
Gloucester	Severn	Elliptical	150	35	4 6	1827	Telford.
London	Thames	Elliptical	152	37 $\frac{1}{2}$	4 9	1881	Rennie.
Tournon	Douv.	Circular	157	65	1545	..
Verona	Adige	Elliptical	160	53	1354
Lavaur	Agout	Elliptical	160	65	10 9	1775	Saget.
Gignac	Heraut	Elliptical	160	44	6 5	1793	Garipuy.

Chester	Dee	Circular	200	42	4 0	1882	Hartley.
Washington Aqueduct	Cabin John Creek.	220	Meigs.
Adolphe	278	102	4 8	1903

The development of the railway system, with command of plenty of capital, afforded opportunities for the construction of bridges on a grander scale than for common roads. The largest railway bridges usually cross rivers or canals, the smaller bridges provide for passing over or under local roads, and for field communication; as a result of this latter fact the number of bridges required on a railway is much greater than on a corresponding length of highway.

The brick bridge over the Thames at Maidenhead, on the Great Western Railway, designed by Mr I. K. Brunel, supplies a remarkably daring instance of wide spans, combined with a low rise of arch. It consists of a central pier and two main arches, flanked at each end by four openings for the passage of flood-water. The main arches are elliptical, 128 feet span, with a rise of 24 $\frac{1}{2}$ feet only. The land arches are semicircles, 28 feet in diameter. The central pier stands in the middle of the river upon a shoal which provided a good foundation, whilst the deep waterway was left free for navigation. The low rise of the arches was imposed by the condition of the gradients.

With the railway system, nevertheless, the semicircular stone arch has been revived in bridges as well as in viaducts. One of the most imposing structures of this class, on the former Glasgow and South-Western Railway, is the Ballochmyle stone viaduct (fig. 7), over the river Ayr, which

Fig. 7.—Ballochmyle Bridge.

spans the river by a semicircular arch of 180 feet span, founded on rock—the largest span of railway masonry in Britain or elsewhere—with six auxiliary arches of 50 feet span. The arch stones of the central arch are 4 $\frac{1}{2}$ feet broad. The centering of timber erected for the construction of this arch was a masterpiece of carpentry, well worthy of careful study. Its principal members were composed of 14-inch square balks, carried up from the bed of the river, well braced by diagonals, especially transversely, as the height was very great in proportion to the width. Rails were laid at the upper part of the framing to carry the traversing cranes employed in the construction of the arch. The highest point of the centering stood 157 feet 4 inches above the bed of the river. The level of the rails on the viaduct is 167 feet high.

The Congleton Viaduct, on the Manchester and Birmingham Railway, is amongst the longest in Britain. It is of stone, 1026 yards, or more than half a mile in length, and 106 feet high. It cost £113,000, or £113 per lineal yard. The Dane Viaduct, on the same line, is of brick, 572 yards long, 88 feet high; and it cost £54,000, or £95 per

lineal yard, having 23 arches of 63 feet span. On the railway lines entering London and other large cities and towns there are miles of brick viaducts. On the Vincenza and Venice Railway there is a viaduct (1845) of stone and brick, by which the Laguna Veneta is crossed, consisting of 222 arches, and 12,000 feet, or more than two miles long. Thus is Venice, the ocean city, chained to the mainland.

Timber bridges, or frame bridges, as they are occasionally called, are in Britain never now employed for railway work by reason of their want of durability, and on account of the much heavier loads imposed on bridges by modern rolling-stock. Such railway bridges as have in earlier times been built of timber in Britain have been reconstructed of stone, brick, iron, or steel. Nevertheless, timber bridges are in some situations, in new and poor countries, practically the only works available where timber is abundant and cheap. Timber bridges and viaducts on a large scale were built in the United States of America for road and railway purposes down to about 1850, from which date metal trusses began gradually to entirely supersede timber structures. The 'inflexible arched truss,' introduced by Mr D. C. McCallum, has probably been in more general use in the States than any other system of timber bridge. It is illustrated in fig 8, showing one-half of a railway bridge of 200 feet span, 15 feet wide in the clear for a single line. The depth of the truss is 26 feet at the centre, 21 feet at the ends. Its cost is said to be from £6 to £8 per lineal foot. Some of the timber viaducts

Fig. 8.—Inflexible Truss Bridge—Half Length.

were carried on timber piers of exceptional height; the Genesee Viaduct had trestle piers 190 feet high.

Cast-iron Bridges.—Towards the close of the 18th century some bridges were erected, the arches of which were constructed mainly of cast-iron. The first of these structures was the bridge over the Severn, near the town of Ironbridge, erected by Mr Darby, of Coalbrookdale Ironworks, in 1779. The bridge consisted of a single arch, nearly semicircular, of 100 feet span. The most celebrated bridge of cast-iron was the old Southwark Bridge across the Thames, designed and erected by Mr Rennie, opened in 1819. It consisted of three cast-iron arches with stone piers and abutments, the central arch having a span of 240 feet and the two side arches spans of 210 feet. The traffic having become too great for the old bridge, it was replaced by a new bridge which was completed and opened for traffic in 1921. Temporary foot bridges for pedestrian traffic having been

erected, the old bridge was completely closed to the public on 4th November 1913, and the work of demolition at once begun. On the city side the gradient of the approach to the old bridge was about 1 in 18; for the new bridge the gradients have been reduced to 1 in 37 on the city side and 1 in 46 on the Southwark side. The new bridge was designed by Messrs Mott & Hay, and the contractors were Sir William Arrol & Co. of Glasgow. The new bridge has five spans, the central opening is 140 feet 6 inches wide, the two intermediate openings 131 feet 9 inches, and the two shore openings 123 feet. The openings are spanned in each case by seven steel arched ribs spaced 8 feet 9 inches centres, except the outer pair on each side, which are 5 feet centres. The total width of the bridge between the parapets is 55 feet. There are two footways of 10 feet each and a roadway of 35 feet. It is interesting to note that the caissons used for the pier foundations were the largest yet made in this country, two of them being 102 feet by 30 feet in cross-section. (For description of this new bridge, see *Engineering*, vol. 99, p 479)

The high-level bridge over the deep ravine through which the Tyne flows between Newcastle and Gateshead is a unique structure in cast-iron, a fine example of the bow-string arch. It formed the junction between railways from York and from Berwick, then separate (now the London and North-Eastern main line). It was proposed by Mr Hudson, the railway king, and designed by Mr Robert Stephenson and Mr T. E. Harrison. There are two roadways—one for carriages and foot-passengers, level with the Castle-garth, and the other, 22 feet above it, for railway traffic. The bridge consists of six spans of 125 feet each; the piers, 16 feet thick, being of masonry, the arched ribs of cast-iron, and the ties of wrought-iron. The soffit or under side of the roadway is 83 feet above high-water. The total height of the piers is 131 feet from the foundation. The carriage-road is 1380 feet in length—about a quarter of a mile. It forms one of the most striking features of the bridge.

It is suspended from the upper or railway roadway. There are 4728 tons of cast-iron in the bridge, and 321 tons of wrought iron. The bridge cost £243,000, or, say, £176 per lineal foot. It was opened by Queen Victoria in 1849. The first difficulty in building the bridge was to secure a good foundation for the piers. The first pile was driven to a depth of 32 feet in four minutes; and as soon as one was placed, the traveller hovering overhead presented another, and down it went, like a pin into a pin-cushion. When the piles had been driven and the cofferdams completed, the water was pumped out. But though powerful engines were employed, it forced itself through the bed of quicksand as fast as it was removed. Every effort was made for months to overcome it, but without success, until at last a bed of cement-concrete was laid in, a foundation was made, and the piers were built.

This bridge is historically interesting, as it shows a transitional form intermediate between the arch and the girder—between cast-iron structures and wrought-iron structures (see also the article NEWCASTLE).

Wrought-iron Bridges.—The unsuitability of cast-iron as a material for bridges of very large span—long-span bridges, as they are called—raised the question of the sole employment of wrought-iron as the material for the crossing of the Conway and the Menai Strait, on the line of the Chester and Holyhead Railway, involving spans of 400 feet and upwards. The maximum existing span in cast-iron—that of Southwark Bridge—did not exceed 240 feet; and for the greater spans Mr Robert Stephenson conceived the idea of wrought-iron tubes for crossing the Conway River and the Menai Strait in large spans, through which railway trains were to be conducted. Sir William Fairbairn devised and conducted the preliminary course of experiments required for the purpose of testing by models the strength of such a structure, with others of elliptical and rectangular section for comparison. Rectangular tubes had the advantage in point of strength, and a model beam accordingly was constructed, to a scale of one-sixth of the proposed bridge. It bore the test most satisfactorily, and showed that the proposed tube could be made self-supporting over the desired span of 460 feet. Arrangements were accordingly made for the erection of the colossal structure itself. The

Fig. 9.—Britannia Bridge.

Britannia Bridge (fig. 9), so called after the Britannia Rock on which the central pier rests, was built across the Menai Strait. It consists of two independent continuous wrought-iron tubular beams, 1510 feet in length, weighing 4680 tons each, independent of the cast-iron frames inserted at their bearings in the towers. They rest on two abutments and three towers of masonry at a height of 100 feet above high-water. The middle, or Britannia, tower, 230 feet high, is built on a rock in the middle of the strait. The bridge is thus in four spans, of which there are two spans of 460 feet over the water, and two spans of 230 feet over the land. The weight of one of the longer spans, single tube, is 1587 tons, and that of one of the shorter spans 630 tons. The average weight of a single tube is over three tons per lineal foot of advance. A transverse section of each tube is shown by fig. 10. The chief mass of the material is placed at the top and the bottom, represented by the upper and lower flanges or tables of an ordinary beam, the two sides serving to connect the top and the bottom. Constructed

of plate-iron, the top requires more metal than the bottom, in order to resist the buckling stress to which it is subject. But instead of putting the metal into one thick plate, or into several plates laid one on another, it is constructed to form a set of small tubes or cells, which give additional stiffness and strength to the whole tube. The floor, in

Fig. 10.

like manner, contains cells. Each tube is straight on the lower face, and slightly curved on the upper face, inasmuch that the height of the tube externally is 30 feet at the middle in the Britannia Tower, and 26 feet internally, and 22 feet 9 inches and 18 feet 9 inches at the extremities in the abutments. The width of each tube externally is 14 feet 8 inches, and 13 feet 5 inches clear inside. The side plates are from $\frac{1}{2}$ inch to $\frac{5}{8}$ inch in thickness; the top plates are from $\frac{3}{4}$ inch to $\frac{1}{2}$ inch, for resisting compression; and the bottom plates are from $\frac{1}{4}$ inch to $\frac{1}{8}$ inch thick, for resisting extension. The tubes repose solidly on the centre tower, but on the land towers and abutments they repose on roller beds, thus permitting free expansion and contraction according to the temperature. The daily variation of length is from $\frac{1}{2}$ inch to 3 inches for the whole length of the tube, the extremes of the movement being attained at about 3 P.M. and 3 A.M. The effect of sunshine in deflecting the Britannia Bridge, as observed by Mr Edwin Clark, is very curious. A short spell of sunshine on the top of the tube raised it on one occasion nearly an inch in half-an-hour, with a load of 200 tons at the centre, the top plates of the bridge being expanded by increase of temperature, while the lower plates remained at constant temperature by radiation to the water beneath them. In like manner, the tube was drawn sideways to the extent of an inch by the sun shining on one side, and it returned immediately to its normal position as clouds passed over the sun. The tubes sometimes move as much as 2 $\frac{1}{2}$ inches vertically or horizontally when the sun shines on them. The tube is in fact a most delicate thermometer, in constant motion, both vertically and laterally. The Britannia Bridge was opened in March 1850 by the passage through it of three powerful locomotives with tenders. The second experimental train that went through consisted of twenty-four heavily laden coal-wagons, aggregating 300 tons weight. The train was drawn through the tubes at leisurely speed. During the passage a breathless silence prevailed, and when the train emerged at the other end the event was announced by great cheering, mingled with the reports of pieces of ordnance. One can imagine the relief from intense anxiety to the engineer. 'Often at night,' said Mr Stephenson, 'I would lie tossing about, seeking sleep in vain. The tubes filled my head. I went to bed with them, and got up with them. In the gray of the morning, when I looked across Gloucester Square, it seemed an immense distance across to the houses on the opposite side. It was nearly the same length as the span of my tubular bridge.'

A similar tubular bridge across the Conway, on the line of the Chester and Holyhead Railway, was designed and erected by Mr Stephenson. It consists of two tubes, each of one span of 400 feet, and was opened for traffic in May 1848.

The Victoria Railway Bridge (1854-59) over the

St Lawrence River, at Montreal, Canada, was tubular in design, like the Britannia Bridge. It is 9144 feet, or nearly 1 $\frac{1}{2}$ miles in length, in twenty-four spans of 242 feet, and a central span of 330 feet. The total length of each of the tubes was 6592 feet; and there were 9044 tons of iron in the tubes, or about 1 ton per lineal foot. In 1898-99 it was reconstructed and enlarged as a truss bridge. The river is 8660 feet, or about 1 $\frac{1}{2}$ miles wide at the crossing, where it descends at the rate of 7 miles per hour. The bridge is remarkable chiefly for its ice-breaking piers, which are constructed with large bows at the up river ends to resist the enormous pressure of the ice in spring. The rails are 60 feet above the level of the river.

Although tubular bridges are not likely to be constructed in the future, it should be remembered that it was in tubular bridges that the first attempt was made to introduce wrought iron in long spans upon railways. This was done by Mr Stephenson at a time when perhaps it would not have been in the power of any other man to influence the introduction of wrought-iron in such structures. The experience of the tubular bridge, nevertheless, led to a development of plate-iron girder bridges, in which the cellular principle of the tubular bridge has been applied in the designing of the longitudinal girders or beams between which the roadway is carried. The early forms for such girders are typified in the wrought-iron girders of the Torksey Bridge, Lincolnshire, erected in 1850. The bridge is constructed of two spans of 130 feet each. The girders are of uniform depth—10 feet. The upper boom or member of each girder is cellular, being the form best adapted to resist compression, and is constructed of plates $\frac{3}{8}$ inch and $\frac{1}{4}$ inch in thickness. The lower boom is not cellular like the top, as it is exposed only to tensile stress, and is constructed of plates $\frac{3}{8}$ inch and $\frac{1}{2}$ inch thick, riveted together. The two side plates, enclosing a hollow space, are made of $\frac{1}{2}$ -inch plates. Plate girders are now only used when the bridge to be built has spans which do not exceed about 100 feet.

Lattice-girder Bridges.—The lattice bridge—so called from having sides constructed with cross-bars, like lattice-work—is the natural outcome of the tubular bridge for long spans, developing equal strength with considerable economy of material and labour.

Lattice bridges of timber were first used in America, where timber is cheap. The first lattice-girder in iron was designed by Sir John MacNeill, and erected in 1843 on the line of the Dublin and Drogheda Railway, near Dublin, of 84 feet span.

Fig. 11.

Lattice-girders are now almost universally adopted for steel bridges for long spans. Amongst the earliest of them is the lattice bridge forming a portion of the Boyne Viaduct on the line of the Dublin and Belfast Junction Railway, near

Drogheda, completed in 1855. It has three large openings, of which the middle span is 264 feet long, and the side spans 138 feet. There are two side girders 26½ feet deep, 24½ feet apart, connected by cross girders of lattice-work above and below—forming a rectangular enclosure, within which, on a platform, two lines of rails are laid on which the trains run. Each of the lattice bars is crossed by six others at the angle 45 degrees, forming squares (fig. 11).

The King Edward VII. Bridge, Newcastle-on-Tyne, is an excellent example of the lattice type girder bridge of modern design. The main line

of the North Eastern Railway was carried across the river Tyne by the old high-level bridge already described. This bridge provided for three lines of railway, and for nearly sixty years the whole railway traffic of the district had to be worked over these three lines. The traffic having increased beyond the limits of these three lines, the railway company decided to construct a new high-level bridge with four lines of railway, and an act of parliament was obtained in 1899. The new bridge is 710 yards west of the old structure, and the site was so chosen that trains from London could enter Newcastle Central Station at one end

Fig. 12.—King Edward VII. Bridge.

and proceed north from the opposite end of the station, thus obviating the old arrangement by which trains had to enter and depart at the same end of the station. The new bridge was designed by Dr Charles Harrison, engineer to the northern division of the North-Eastern Railway, and the contract for the work was let in 1902 to the Cleveland Bridge and Engineering Co., Darlington. The cost of the bridge and approaches, exclusive of the cost of land and permanent way, was about £500,000.

There are three main piers in the river, the third pier being in the centre of the river-channel. The north land span is 231 feet long, the two river spans are each 300 feet long, and the south land span ranges from 174 feet 6 inches to 205 feet. The height of the two river spans is 84 feet above high water of ordinary spring tides, and the main girders are of lattice design, the north land span and the two central spans being similar. There are five main girders to each span; in the two central spans each main girder is 308 feet long and 27 feet deep over the angles of the booms, the booms being 5 feet 6 inches wide and 3 feet deep. The south end of each girder is free to expand. The total weight of one 300 feet span is 1635 tons, or, inclusive of the bearings, 1736 tons.

Fig. 12 shows a side elevation of the structure, and the figure indicates clearly the type of lattice-girder employed in the bridge.

The three river piers are carried on caissons, the sinking of which was carried out under compressed air. The caissons were constructed of mild steel, the thickness of the outer plates of the shell varying from ½ inch to ¾ inch. The area of all three caissons was 3361 square feet over the outside of the cutting edge, the height of the permanent part varying according to the level of the river-bed, the south caisson being 54 feet high, the centre caisson 26 feet 6 inches, and the north caisson 56 feet. The interior of the caissons was filled eventually with concrete, in the case of the south caisson the weight of the concrete being about 10,000 tons. The cement concrete in the caissons finished at the river-bed level, and from this point upwards the piers are constructed of granite masonry, and are 103 feet 6 inches by 30 feet 6 inches in cross-section at the bottom. (See *Minutes of Proceedings Inst. C. E.*, vol. clxxiv. p. 158.)

American Quadrangular Girder Bridges.—One of the best examples of American long-span iron-bridge construction (fig. 13) is the bridge across the Kentucky River on the Cincinnati Southern Railway, designed by Mr C. Shaler Smith—

noteworthy for the economical design and comparatively light weight. The ironwork of the bridge is 1138 feet in length, and it consists of three spans of 375 feet each. It crosses a limestone cañon at a height of 280 feet above the bed of the stream. The piers are of stone to a height of 60 feet, to clear the highest recorded floods; and they are about 34 feet thick at the flood-level. Above the stonework the piers are of iron. The truss or girder is rectangular in section, 37½ feet high, 18 feet wide, consisting of top and bottom pairs of booms, forming the corners, united by panels or frames at intervals of 18½ feet longitudinally, stiffened and bound with diagonal tie-rods. The booms each consist of flat plates placed vertically, riveted together. The piers consist of hollow pillars of

Fig. 13.

Bridge across the Kentucky River—Half Length.

plate-iron riveted together in box form. The diagonal rods are 'pin-connected'; that is to say, they are connected to the framework with cylindrical pins, a form of connection much practised in the States. The bridge was completed in February 1877. The expansion and contraction of the bridge operate each way from the centre, bending the tops of the piers correspondingly towards or from the shores—the greatest observed movement being half an inch either way. The ends of the girder rest by means of rollers on the abutments, and they have a maximum of 3 inches of travel resulting from variation of temperature. The ironwork of the bridge weighs 1631 tons, or 1.43 tons per lineal foot—less than half the weight per lineal foot of the tubes of the Britannia Bridge.

The Ohio Bridge on the Cincinnati and Covington Railway is a remarkable illustration of the application of the lattice-girder type of construc-

tion—its central span is 545 feet, and the two side spans are 490 feet. The three spans weigh about 5000 tons, and the bridge carries two lines of rails, two roadways, and two footways. It was built in 1888

Cantilever Bridges—The Forth Bridge.—The principle of the cantilever bridge has already been noticed as applied primitively in Japan and India, and in China also. A cantilever is, as Baker has said, a bracket; a structure overhanging from a fixed base. The bridge across the river Forth (fig 14), on the North British Railway system, opened by the Prince of Wales, 4th March 1890, is the largest and most magnificent bridge in the world. The engineers were Sir John Fowler, K C M G., and Sir Benjamin Baker. The site of the bridge is at Queensferry. At this place, the estuary of the Forth is divided by the island of Inchgarvie into two channels, whose depth, as much as 200 feet, precluded the construction of intermediate piers. Hence, two large spans of 1700 feet each were adopted. Between these, the central pier is founded on the island midway across, and is known as Inchgarvie pier. There are two other main piers—shore-piers—known respectively as the Fife pier and the Queensferry pier. On these three piers respectively three double lattice-work cantilevers (fig. 15), like scalebeams,

cylindrical columns of masonry 36 feet high, each 49 feet in diameter at the top, and 55 feet at the bottom, founded on rock or on boulder-clay. To make assurance doubly sure, the superstructure is bolted down to each column with forty-eight steel bolts 2½ inches in diameter and 24 feet long.

The piers were founded by means of Cofferdams

Fig 14.—General View of the Forth Bridge (looking up the river).

Fig. 15.—One of the Cantilevers of the Forth Bridge.

1360 feet, or a quarter of a mile in length, are poised in line, reaching towards each other, and connected at their extremities by ordinary girders 350 feet long, by which the two main spans are completed. The bridge consists of two main spans of 1700 feet, or nearly one-third of a mile each; two of 675 feet each, being the shore-ends of the outer cantilevers; and 15 spans of 168 feet each. The total length of the viaduct, including piers, is 8296 feet, or a little over 1½ miles, of which almost exactly 1 mile is covered by the great cantilevers. The clear headway under the centre of the bridge is 152 feet at high-water, and the highest part of the bridge is 361 feet above the same level. Each of the three main piers consists of a group of four

(q.v.) for shallow depths under water, and Caissons (q.v.) worked with compressed air for the deep water at Inchgarvie and at Queensferry. At Inchgarvie, two caissons constructed of wrought-iron plates, 70 feet in diameter, were sunk, the rock being excavated from below the lower edge of the cylinder, to a depth of 72 feet below the waves of the Forth. The operations were conducted under the pressure of compressed air in a mining-chamber 7 feet high, lighted by electricity, at the lower end of the caisson. A striking incident served to impress the reality of the high pressure of the air in this chamber. A flat-sided spirit-flask was taken down and emptied. The bottle of course was filled with compressed air, of a pressure of 33 lb. per square inch, and was coiled. Under this pressure it exploded when passing through the Air-lock (q.v.) into the open air. At Queensferry, four caissons like those employed at Inchgarvie were sunk to depths of from 71 to 89 feet below high-water. The bed of the river was of soft mud, through which the caissons were sunk into hard boulder-clay. The mud, after having been diluted with water, was blown out by the compressed air supplied to the mining-chamber. The caissons were gradually filled with concrete as it was required, to steady them, and at the same time to drive them down by deadweight through the clay. When they were sunk to the required depth, the bottom or mining-chamber was cleared out and rammed with concrete, grouted up under pressure. No subsidence took place after this final operation, the boulder-clay being very hard. But independently of this consideration, it is readily seen that by in this way substituting the whole area of the immense circular caisson for the mere circular cutting-edge at the bottom to take a bearing on the clay, the bearing surface, and with that the resistance to a vertical load, was almost indefinitely increased. When the concrete was filled to the water-level, the piers were carried up with massive stones laid in cement, the whole pier becoming one solid mass.

The bridge is taper in plan, each span narrowing from a width of 120 feet—the distance apart of the lower members of each cantilever—at the pier, to a minimum of 31½ feet at the extremities of the cantilever, giving an outline, in a vertical view of it, like a truncated triangle, in order to confer a degree of stiffness laterally, for resisting irregular stresses, wind-pressure in particular. The metal columns above each pier, forming the basis of the cantilever, are 12 feet in diameter. The members under compression are tubular, those in tension are of open braced forms. The wind-pressure is assumed from calculation at a maximum of 56 lb. per square foot. The maximum possible stress on any member of the bridge is calculated to be at the rate of 7½ tons per square inch of sectional area, leaving a plentiful margin of strength, since the steel of which the bridge is constructed is capable of resisting a tensile stress of from 30 to 33 tons per square inch, and compression to the extent of from 34 to 37 tons per square inch. Between the two main girders a double line of railway is carried on an internal viaduct supported by trestles and cross girders. The whole of the metal-work of the superstructure is of Siemens steel. The way will consist of heavy bridge-rails laid on longitudinal sleepers bedded in four steel troughs, into which the wheels will drop in case of derailment, when they will run on the sleepers.

In the piers there are about 120,000 cubic yards of masonry, and in the superstructure 44,500 tons of steel. The bent steel plates which go to make the tubes and struts would, if placed in a line, end to end, stretch a distance of 42 miles. There are 20 acres of surface to be painted. The contract was let for the sum of £1,600,000, or £215 per lineal foot. An impression of the great magnitude of the bridge is derived from a comparison with the largest completed railway bridge in England—the Britannia Bridge, which has spans of 460 feet—little more than one-fourth of the spans of the Forth Bridge. The best proof of approval is imitation. In this connection mention should be made of the fine organisation of labour secured by Sir Wm. Arrol, of Tanager, Arrol, & Co., the contractors, and of the ingenious special tools designed by him for carrying out the work of construction. Since the first publication of the design for the Forth Bridge, nearly every new long-span bridge throughout the world has been built on the principle of that design, the most important being the railway bridge over the river St Lawrence at Quebec.

Quebec Bridge over the St Lawrence.—The Quebec Bridge and Railway Company called for tenders for this great structure in 1898, and the contract was eventually given to the Phoenix Bridge Company of U.S.A. The bridge, which connected

important railway systems and reduced the railway mileage between Moncton and Winnipeg by 219 miles, was of the cantilever type, and was designed for two lines of railway and a roadway and electric railway on each side, the length between abutments being 3240 feet. The great central span was 1800 feet (exceeding that of the Forth Bridge by 91 feet), and the central girder was 675 feet as compared with 350 feet in the Forth Bridge. The work of erection was started in July 1905, but unfortunately, on 29th August 1907, the structure collapsed while under construction, the disaster involving a serious loss of life. Immediately after this disaster the Canadian government appointed a royal commission to report upon it, and after receiving the report of this commission, a board of three engineers was appointed to prepare a new design for the bridge. Eventually, after much discussion, tenders were called for in June 1910, and the design of the St Lawrence Bridge Company was accepted in February 1911, and the contract was signed on 4th April 1911, the enterprise becoming thus a pure Canadian one. The new design provided for a total length of 3240 feet between abutments, a central span of 1800 feet, a central girder of 640 feet with a clear headway of 150 feet for this length; the total height of the two piers at the ends of the main span was 310 feet above the masonry-work. In the new design roadways were not provided, owing to the difficulties of making the necessary connections on the north side with existing highways, and to the greatly enhanced cost of superstructure if provision were made for them. The bridge as now constructed therefore carries only a double railway track and two side-walks, the width from centre to centre of trusses being 88 feet and uniform from end to end of the bridge. The work of erection proceeded smoothly up to September 1916. By this time the cantilevers had been completed and the 640 feet central span had been erected on false work at Sillery Cove on the north bank of the river, and the preparations for floating the span out and hoisting it into position had been made. On 11th September the girder was floated to its designed position and the work of lifting it began. Unfortunately disaster again overtook the bridge; when the girder was hanging about 30 feet above the level of the water it slipped off its supports and fell into the water at 10.46 A.M. Undismayed by this second failure, it was at once decided to rebuild the central span on exactly the same lines as that of the one which had fallen, and to adopt the same method of hoisting, employing new hoisting chains and rebuilding all the suspension gear and jacking girders. On 20th May 1917 work was

Fig. 16.—Quebec Bridge.

begun on the new central girder at the old site, Sillery Cove, and by 20th July the span was completed; on 17th September 1917 the girder, weighing about 5000 tons, was successfully towed out into mid-river, and by 9.10 A.M. the work of jacking was started; the work proceeded satisfactorily and without a hitch until 20th September, when the great girder had been lifted 150 feet to its final position, and on the 21st the permanent

connections to the cantilevers were all completed. The floor system was then laid across the span, and the first train crossed the bridge on 17th October, and on 3d December 1917 the great structure, with the greatest length of span ever constructed, was handed over to the Canadian government and opened for general traffic (fig. 16). (See *Transactions of the Engineering Institute of Canada*, 1919, vol. xxxii.)

The bridge over the Zambezi at the Victoria Falls (1905) is of great railway bridges the highest above water. Other railway bridges are:

	Length. Feet	Greatest Span. Feet
Forth Bridge	8296	1700
Brooklyn Bridge	5989	1595
Niagara Bridge		821
Britannia Bridge	1510	460
Victoria, Montreal	9144	330
Boyne Viaduct	1760	264
Tay Bridge	10,780	245
Charing Cross Bridge	1365	154
Crumlin Viaduct, Monmouthshire	1800	150
High-level Bridge, Newcastle-on-Tyne	1880	125
Amu-Daria Bridge	6320	
Memphis Bridge (over Mississippi)	1586	790
Cernavoda Bridge (Danube)	2350	600
Sukkur Bridge (Indus)	1250	790

The latter has cantilevers each 320 feet long.

Suspension Bridges.—These are bridges in which the roadway is suspended from chains, links, or ropes, passing over piers or towers, and fixed or anchored at their extremities. Another line of evolution had its origin in the principle of suspension. The simplest form, if possible, is a rope, traversed by a pulley, ring, or grooved block of wood, from which a rude car is suspended, or, in some cases, only a loop, in which the passenger sits, and either works himself across with his own hands, or is drawn from side to side by a smaller line attached to the car. Such elementary bridges have been in use from the earliest ages. More than a hundred and thirty years ago, Don Antonio de Ulloa described them as commonly used in the mountainous districts of South America. Structures of a more bridge-like character were erected by the Peruvians. Six strong cables are suspended across the river, four of which carry the platform, consisting of sticks laid across them, and branches of trees laid longitudinally upon the sticks. The two other ropes are considerably higher than the platform, and are connected with it. They serve as rails for the security of the passenger. Ulloa observes that 'the appearance of the bridges, which move with the wind, and are agitated by the movements of every passenger that crosses them, is very frightful at first.' They cross chasms hundreds of feet deep, through which cataracts of water, derived from the melting snow, rush, lashed into irresistible fury.

Fig. 17.—Suspension Bridge.

Fig. 17 is a typical illustration of a modern suspension bridge. When the weight of the roadway is known by the stress on the suspending links, the problem of statical equilibrium assumes the simplest form, and the conditions of strength and stability are readily determined. But when there is a shifting or rolling load on the roadway, which is heavy in proportion to the weight of the bridge, as, for example, a railway train, the conditions are involved. When the train occupies, say, only one-half of the bridge, the chain is depressed on that side, and is raised on the other side. Thus an undulation is produced in the bridge, which, especially if the train be moving rapidly, may seriously disturb the equilibrium, and even endanger the stability of the bridge. Various combinations have been devised to overcome this difficulty. The simplest and probably the best course is to stiffen the roadway, so that the stress of the passing load may be distributed over a considerable

length of the chain. In this manner large railway bridges have been constructed in America—for example, the former Roebling's bridge (1855) over the Niagara, 2½ miles below the falls, with a span of 822 feet, and 245 feet above the level of the stream. A hundred yards higher up is a cantilever railway bridge (1883).

The Menai Suspension Bridge, designed and constructed by Thomas Telford, was a great step, in its own time, as its neighbour the tubular railway bridge of Robert Stephenson. After various abortive designs were proposed and abandoned, Telford put forward his plan for crossing the straits by a suspension bridge of one large span, 100 feet high above the water-level. The roadway is suspended from four cables, each consisting of four tiers of bars, making in all sixteen chains, having a drop of 57 feet, or about one-tenth of the span. There are two carriage-ways, each 12 feet wide, with a footpath between them, 4 feet wide. The chains consist of flat bars on edge, 10 feet long, 1 inch thick, and 3½ inches wide, connected to each other by round bolts. The total length of the bridge is 1710 feet, or about one-third of a mile; and the distance between the points of suspension is 579 feet. The total weight of iron used for the structure was 2187 tons. The bridge occupied six years in construction, and was opened in 1825. The total cost, including the embankment and about half a mile of new line of road, was £120,000.

The success of the Menai Suspension Bridge having been assured, one of a still larger span, 870 feet, at an elevation of 167 feet above the river, was constructed at Freiburg, which crossed the valley of the Sarine, in Switzerland. The bridge was suspended by wire-ropes, each consisting of eighty wires, ¼ inch thick, tied together by coils at intervals. The bridge was finished in 1834, demolished 1924. There is a similar, but rather smaller, bridge over the Gotteron, a tributary of the Sarine.

The Clifton Suspension Bridge (fig. 18) has an interesting record. In 1753 William Vick, a Bristol alderman, bequeathed the sum of £1000, to accumulate at compound interest until it reached £10,000, and then to be used in constructing a stone bridge at or near the site of the present Clifton Bridge. This sum was augmented by contributions, and in 1830 an act was obtained for the construction of the bridge, to the design of Mr Telford, having a central span of 400 feet. The work subsequently passed into the hands of Mr I. K. Brunel, a man of large ideas, who made a new design for a single span of 702 feet, at a height of 250 feet above high-water level. The new design was proceeded with in 1836, and the abutments and piers were completed; but, for want of funds, the work was arrested until 1860, when advantage was taken of the removal of the old Hungerford Suspension Bridge, to make room for the Charing Cross Railway Bridge. The chains were bought at a low cost, and in 1861 the works of the Clifton Bridge were resumed, in which the old chains were utilised. In the new bridge there are three chains on each side, supporting longitudinal stiffening girders of wrought-iron, with open-work cross-girders to carry the floor of the bridge. The hand-railing was also ingeniously utilised with lattice-work as a girder to co-operate in stiffening the platform. The span of the bridge, measured between the centres of the piers or towers, is 702½ feet; the width is 31 feet, including 20 feet of roadway defined by the distance apart of the chains, and two footways, one at each side. The roadway is not on a dead level, but between the piers has a rise or arching of 2 feet. The chains, passed over the piers on cast-iron saddles or rollers, are carried downwards to land-saddles at a distance of 196 feet from the piers, bedded on

brickwork set upon the solid rock. Sixty feet farther the chains are carried down at an angle of 45 degrees to the anchorage-plates, bedded in a mass of brickwork in the form of an arch abutting on the solid rock far below the surface of the ground. All the links were proved with a stress of 10 tons per square inch. The platform is suspended by vertical rods from the chains, and that the stress on the rods may be adjusted and equalised, they are fitted each with a double adjusting screw at the lower end. The roadway is of creosoted timber 5 inches in thickness. The footways are laid with timber of half this thickness. The weight of the chains between the piers is 554 tons; and yet they are subject to a tensional stress of 680 tons at the middle, by their own weight. The suspension-rods, guides, flooring, &c. weigh 440 tons, making, with the chains, a total weight of nearly 1000 tons. It is calculated that, if the bridge be loaded all over the platform at the rate of 70 lb. per square foot, which is estimated as the maximum weight of a crowd, the final stress on the chains at the middle would amount to 2094 tons, or 4½ tons on each square inch of section of the chains. In order to provide for the effects of expansion and contraction and other causes of disturbance, the two ends of the roadway are furnished with hinged flaps 8 feet long, which give perfect freedom of movement vertically as well as horizontally.

The Brooklyn Suspension Bridge across the East River, between New York and Brooklyn, opened in 1883, is built of steel. It has a central span of 1595½ feet, and two land spans of 930 feet each; making, with the approaches, a total length of 5989 feet, or about one mile and one furlong. The anchorage at each end is a solid cubical structure of stone, measuring 119 feet one way, by 132 feet the other, rising to a height of 90 feet above high-water mark, weighing 60,000 tons each. The towers are 276 feet high. The weight of the whole structure suspended between the towers is nearly 7000 tons. The stress of suspension is borne by four cables, of 5000 steel wires each, 15½ inches in diameter. The foundations of the towers were laid by means of caissons and compressed air, at a level of about 80 feet below high-water mark. The roadway presents five parallel avenues, of an average width of 16 feet each, the two outmost for vehicles, the central one for foot-passengers, and the other two for tramways. For the second bridge,

the longest suspension bridge in the world, see NEW YORK.

Movable Bridges.—Movable bridges are usually required in the neighbourhood of rivers, docks, wharves, canals, and like situations, for the passage of ships and boats. They are variously designed

Fig. 18.—Clifton Suspension Bridge.

and adapted to particular situations, and may be classified as: (1) bascules or drawbridges, (2) swing bridges, (3) traversing bridges, (4) lift bridges, (5) pontoon bridges.

Bascules or Drawbridges.—The bascule bridge is such as is raised by turning, in one piece or in two pieces, round one or two horizontal axes or hinges. The most ancient form of the bascule was that of

Fig. 19.—Brooklyn Suspension Bridge.

one flap of framed timber used to cross the moat or ditch of a fortress or castle, and capable of being drawn up by means of chains from the inside. For large dimensions it is convenient to construct the bridge in two halves, lifting from each side, and

abutting together at the middle. An excellent bascule bridge, erected in 1839, on the North-Eastern Railway, across the river Ouse, gives a clear water-way of 45 feet. The bridge is opened by two men, one at each leaf, in about one minute and a half, and is opened about eight times every day. One of the largest bascule bridges is that at Copenhagen, which was opened for traffic in 1867, giving a free passage-way of 56 feet 8 inches. The bridge is counter-weighted with 57 tons load at the end of the tail, which is $13\frac{1}{2}$ feet from the centre of the hinge.

The Tower Bridge, a bascule bridge, across the Thames, at the Tower of London, opened in 1894, is constructed on such a scale as to be the largest bridge in the world of the bascule class. It is illustrated by fig 20. The bridge may be

Fig. 20.—The Tower Bridge.

described as a compound suspension and bascule bridge of three spans, of which the centre opening is fitted with a bascule or drawbridge, shown lifted in the figure. The bascule is carried by two massive Gothic towers, from which the chains or links are suspended, and in which provision is made for the machinery required for opening and closing the middle span. Lifts at both sides, as well as internal staircases, are provided for the use of foot-passengers. The lifts communicate immediately with the upper footway connecting the towers, so that the foot-traffic is never interrupted. The leaves of the drawbridge, when open, will be flush with the towers, allowing the largest shipping to pass through. When the bridge is closed, there will be sufficient height at high-water for the ordinary traffic of the river to pass under. The bridge has been built of gray granite for the lower portions, hard red brick for the upper portions of the towers. The opening of a passage for vessels, and the closing of the bridge, may be accomplished in the course of four or five minutes. Of the three spans, the clear centre opening for shipping is 200 feet, the side spans are each 270 feet, and the total length between abutments is 800 feet. The headway of the centre span when closed is $29\frac{1}{4}$ feet above Thames high-water, and that of the side spans is 27 feet. The height of the foot-bridge across the centre span is 135 feet above high-water. The approach-roads and the foot-bridge are 60 feet wide. The parliamentary estimate cost of the bridge, including land, is £750,000, or about £940 per lineal foot. The late Sir Horace Jones was

the architect, and Sir John Wolfe Wolfe Barry the engineer.

Swing Bridges.—Swing bridges are by far the most commonly employed of movable bridges. The large rivers to be crossed in America have demanded swing bridges of great span, with excellent contrivances for minimising friction and insuring steadiness when closed. The swing bridge over the Raritan, in New Jersey, U.S., allows two free passages, each 216 feet wide. It is what is known as a double-swing bridge—the bridge being balanced on a central pivot assisted by a system of rollers—opening and closing two passages at once, and affording two passages instead of only one, as in the earlier bridges, which were generally made in two leaves to cross single passages. The Kansas City Bridge crosses two passages, each 160 feet wide. The total

moving weight is 303 tons. The bridge is opened by steam-power in about one minute and a half, or by manual power in two minutes. From two-thirds to three-fourths of the moving weight rests on the central pivot.

Traversing Bridges.

—Movable bridges, sometimes called telescope bridges, capable of being rolled horizontally backward, or in an oblique direction, are occasionally employed. The bridge across the Arun, near Arundel, on the Southern Railway, is 144 feet long. It is traversed on wheels, and acts as a sliding cantilever, the over-

hanging portion resting on the opposite abutment when in place.

Lift Bridges.—These are not common. There appear to be only two—one erected over the Surrey Canal, which is lifted by the four corners; and another over the Royal Canal, Dublin. In the second case, a branch railway crosses the canal at an angle of 25 degrees. The bridge first made for the situation weighed 14 tons, and was balanced by a counterpoise consisting of a tank filled with water, the counterpoise, empty, being 1 ton lighter than the bridge, and when loaded with 2 tons of water, 1 ton heavier. The bridge could thus be raised and lowered with the aid of a man at a winch. The lift of the bridge was $7\frac{1}{4}$ feet, which gave a headway for barges equal to that of the adjoining stone bridge. The supply of water for working the bridge was taken from an adjacent lock. At the four corners rams worked into cylinders, which admitted water from the lock to enter through small holes, and fill the cylinders as the rams were drawn up in the raising of the bridge, acting as a check in case of accident. The bridge has been reconstructed for a greater lift.

Pontoon or Floating Bridges.—Bridges of Boats.

—Bridges of boats are made of boats laid over with planks, fastened across the stream by means of anchors or stakes. The bridge at Rouen is 300 yards long, paved with stone for the passage of carriages and horses. The so-called 'flying bridge' is rather a ferry than a bridge of boats (see FERRY).

A well-known pontoon bridge was designed by Mr Mallet to cross the Royal Canal at the Broad-

stone terminus of the Midland Great Western Railway of Ireland. The general idea is that of a pontoon or flat-bottomed boat of iron. When the bridge is in place, water is admitted until it settles down firmly on timber wall-plates. To open it the water is drawn off by a movable siphon, which is connected with a fixed pipe, having a considerable vertical fall. A smaller branch pipe is set at an angle to the exhaust-pipe, and through it a strong jet of water is allowed to issue. This operation, on a well-known principle of hydrodynamics, sucks away the air from the siphon and causes it to act. The bridge then floats, and is drawn into a recess, leaving the passage clear along the canal.

The longest floating bridge in the world, probably, is the pontoon bridge across the river Hugli, at Calcutta, designed and constructed by Sir Bradford Leslie. The bridge is 1530 feet long between the abutments, and is carried on 14 pairs of pontoons, which are held in position by means of chain-cables, $1\frac{1}{2}$ inches thick, and anchors weighing 3 tons each, laid on the up-stream and down-stream sides, 900 feet asunder. By their great length, the cables afford the necessary spring to allow for the ordinary rise and fall of the river, the stress on each cable varying from 5 tons to 25 tons, according to the state of the weather and of the tide, the maximum velocity of which is 6 miles an hour. The pontoons are rectangular iron boxes, having rounded bilges and wedge-shaped ends. They are each of the great length of 160 feet, made of such considerable length in order to obviate pitching motion in rough weather, with a beam of 10 feet, and depth of from 8 to 11 feet, presenting a side of from $3\frac{1}{2}$ to 4 feet above water, according to the state of the traffic. For perfect safety, each pontoon is divided by bulkheads into 11 compartments. They are made of iron plates $\frac{1}{2}$ inch and $\frac{3}{4}$ inch in thickness, riveted together. The platform of the bridge is supported by tressel-work on the pontoons at a clear height of 27 feet above the water—a convenient height for boat navigation. The roadway platform is of 3-inch planks of teak-wood from Burma, forming a roadway 48 feet wide, with a footpath at each side, 7 feet wide. An opening 200 feet wide, for the passage of ships, is made by removing, when occasion requires, four of the pontoons with their superstructure, and sheering them clear of the opening. The portion so removed is in two divisions, which are separately secured, right and left, and when in place, are connected by draw-bridges with the fixed portions of the bridge. Before launching, the pontoons were ballasted sufficiently to make them float upright; and were afterwards coupled in pairs by the cills of the main trusses, when the ballast was removed. The floating bridge is connected with the shore at each end by adjusting ways hinged to the shore. The ordinary time taken to open the bridge is 15 minutes; and to close it, 20 minutes. It is only opened twice a week. The bridge cost £182,000, or about £120 per lineal foot.

MILITARY BRIDGES are temporary constructions to facilitate the passage of rivers by troops, to restore a broken arch, or cross a chasm of no very great width. Those over a river are either floating or fixed. The former are made of pontoons (q.v.), boats, casks, rafts of timber, or anything that will give sufficient buoyancy, and the latter of piles, tressels, or other timber work. Spars, ropes, and planks are used in a variety of ways for spanning narrow chasms. The pontoon bridge is the only one which is carried with an army. Enough material for 100 yards of length accompanies each army corps. All military bridges have their roadway formed in the following manner: five to nine road-bearers of stout timber support *chesses* or flat planks 10 feet long, held in position so as to

form a level surface, by two *ribands* placed above them and over the outer road-bearers, to which they are fastened by *rack-lashings*. The road-bearers are supported by the pontoons, casks, boats,

Fig. 21—Military Bridge.

tressels, or piles, which form the piers, usually 10 to 15 feet apart, or by transoms on the ropes in the case of suspension bridges. To prevent injury to the boats, barks of timber are built up along the keel of each for the road-bearers to rest upon. A *saddle* on pontoons and *gunnels* on casks answer the same purpose, and in the latter case keep the casks together by being lashed to them. The maximum loads such bridges are usually calculated to bear are, for infantry, 5 cwt. per lineal foot; for cavalry, 2 cwt.; for field artillery, with two horses per gun only, $4\frac{1}{2}$ cwt. Heavy guns are better warped across on specially constructed rafts. A *flying bridge* is a boat or raft anchored by a long cable up-stream, and carried across by the action of the current acting obliquely against its side, which should be kept at about an angle of 55 degrees with the current.

Of the rock formations called *Natural Bridges*, the most remarkable is the natural bridge over Cedar Creek, in Virginia, U.S., 125 miles W. of Richmond. The mass of siliceous limestone through which the little river passes is presumably all that remains of a once extensive stratum. The cavern or arch is 200 feet high and 60 feet wide. The solid rock walls are nearly perpendicular, and the crown of the arch is 40 feet thick.

See Edwin Clark, *The Britannia and Conway Tubular Bridges* (1860); James Hodges, *Construction of the Great Victoria Bridge in Canada* (1860); Samuel Smiles, *Lives of the Engineers* (1862-68); J. Gwilt, *An Encyclopedia of Architecture* (1867); J. A. L. Waddell, *Iron Highway Bridges* (1884); C. B. Bender, *Design of Metallic Bridges* (1885); Henry Law and D. K. Clark, *Civil Engineering* (1881); J. Claxton Fidler, *A Practical Treatise on Bridge Construction* (1887); W. Westhofen, *The Forth Bridge*; and the *Minutes of Proceedings of the Institution of Civil Engineers*.

Bridge, in musical instruments, transfers the vibrations of the strings to the resonance box, and is of the utmost importance in the violin and its kindred, as its material, shape, and position affect the tone. One foot acts chiefly upon the belly of the violin; the other, through the medium of the sound-post immediately below it, upon the back. The bridge raises the strings above the belly so that they may be acted on by the bow, and likewise determines the end of the vibrating portion. It assumed its present form in the time of the Amatis.

Bridge, SIR JOHN FREDERICK (1844-1924), organist, composer, conductor, and writer on music, was born at Oldbury, Worcestershire. He was organist of Manchester Cathedral 1869-75, deputy organist of Westminster Abbey 1875-82, organist 1882-1918, professor in London University from 1902, and held other offices. He composed oratorios and cantatas, and organ music; wrote

Samuel Pepys, Lover of Musique (1903), *A Westminster Pilgrim* (reminscences, 1919), *Twelve Good Musicians* (1920), *The Old Cryes of London* (1921), *Shakespearean Music* (1923).—His brother, JOSEPH COX BRIDGE, composer, organist, professor of music at Durham, was born at Rochester in 1853.

Bridge, WHEATSTONE's, a device for comparing electrical resistances, not invented by Wheatstone (q.v.). See ELECTRICITY, and fig. 17 there.

Bridge-head, or TÊTE DE PONT, is an arrangement of defensive works on the far bank of a river, which runs at right angles to the line of advance of an army. It consists of a central work immediately covering the bridge or bridges, and a line of detached redoubts on a wide arc.

Brigdenorth. See BRIDGNORTH.

Bridge of Allan, a police burgh of Stirlingshire, on Allan Water, 3 miles N. of Stirling, has saline wells and a mild climate, and attracts many visitors. Between it and Stirling is the Abbey Craig, with its Wallace Monument, commanding a fine panorama. Pop. 3500.

Bridgeport, a city and port of Connecticut, at the mouth of the Pequannock, which empties itself into an inlet of Long Island Sound, 57 miles NE. of New York. It has a safe harbour for small vessels, and a considerable coasting-trade. The city is modern and well built, and the streets are shaded by trees; Golden Hill, commanding fine views of the sound and shore, is covered with good residences, many of the inhabitants belonging to New York. There are manufactures of machinery, war-stores, &c. Pop. (1870) 18,869; (1890) 48,866; (1910) 102,054; (1920) 143,555.

Bridges, ROBERT SEYMOUR, poet-laureate since 1913, was born 22d October 1844 the son of a Kentish squire, studied at Eton and Corpus Christi, Oxford, qualified in medicine at Bartholomew's, and practised in that and other London hospitals till he retired in 1882. For a dozen years before that he had been known as a cultured and scholarly poet of indisputable and unique gifts; his lyrics give him a place apart from contemporaries, and some of them have a charm hardly equalled since the Elizabethan days. *The Growth of Love*, *Prometheus the Fire-giver* (1883), *Eros and Psyche* (1885), *October* (1920), are noteworthy poems and volumes; and his plays include *Nero* (1885), *Achilles in Scyros* (1890), *Palicio*, *Ulysses*, *The Christian Captives*, *The Humours of the Court*, *The Feast of Bacchus* (1889), *Demeter* (1905). He showed rare sympathy and insight as a critic in his essay on Keats; and by his examination of Milton's prosody and other studies on verse forms, he has shed much light on the mysteries and fascinations of the subtlest metrical rhythms and harmonies. He has been, perhaps, less happy in his tracts on pronunciation and in his experiments in classical metres, such as *Ibant Obscuri* (1916). Sometimes he seems to defy his own lessons; at times his verses are apparently written to illustrate his theories; and some of his experiments—such as the 'Peace Ode' in 1903, written so that 'if English were spelt as it is or should be pronounced, the syllables would scan according to the laws of Greek prosody'—must be pronounced scholarly, ingenious, and original rather than inspired, happy, or melodious.

Bridget, St (*Birgitta* or *Brigitta*), was born at Finstad, in the district of Uppland, in Sweden, in 1302 or 1303, her parents being of the blood-royal of Sweden. At fourteen she married Ulf Gudmarson, by whom she had eight children. She was for some years mistress of the royal household, and afterwards made pilgrimages to the shrines of St Olaf at Trondhjem, and of Santiago de Compostela in Spain. Ulf died in 1344, and Bridget

founded about the same time the monastery of Wadstena, in East Gothland. Sixty nuns and seventeen monks, with eight lay-brothers, received the rule of St Augustine, as modified by St Bridget, and constituted a new order, which at one time had seventy-four establishments scattered throughout Europe, from Finland to Spain; it has now only a few representatives in Spain, Bavaria, and Belgium. In 1349 St Bridget went to Rome, and, having made a pilgrimage to Palestine, died at Rome on her return in 1373. She was canonised in 1391 by Pope Boniface IX. Her daughter, St Catharine of Sweden (1335–81), was canonised in 1489. The *Revelationes Sanctæ Brigittæ* were written by her confessors; to Bridget have been attributed some discourses on the Virgin and the passion of Christ.

Not to be confounded with this Swedish saint is the Irish St Brigit, or Bride of Kildare (453–523). It is tolerably certain that she was the daughter of one Dubtach at Fochart Muirthemne, in Leinster, entered a monastery at Meath in her fourteenth year, through her extraordinary piety and beneficence gained great fame and influence, and founded four monasteries, the first and chief of these at Kildare, where, after her death, she was buried, and a perpetual fire was kept up in her memory. The rest of her traditional history is a mass of astonishing miracles, and it is supposed that many of these, along with the sacred fire (which was abolished by the bishop of the diocese in 1220), were transferred to St Brigit from the heathen goddess Ceridwen, the Celtic Ceres, on the ruins of whose chief sanctuary the monastery at Kildare was built. She was regarded as one of the three great saints of Ireland, the others being St Patrick and St Columba; in Scotland, too, she was held in reverence, and by the Douglasses was regarded as tutelary saint.

Bridgeton, a city and port of entry in New Jersey, U.S., on both sides of Cohansey Creek, navigable up to this point, 38 miles S. of Philadelphia. The town contains the West Jersey Academy and other educational institutions, and a public library. It has glass-works, iron-works, and manufactures of woollen goods, leather, carriages, machinery, and canned fruits. The surrounding region is well cultivated and fertile. Pop. (1870) 6820; (1880) 8729; (1890) 11,424; (1920) 14,323.

Bridgetown, the capital of Barbados (q.v.), is situated on the west coast of the island along the north side of Carlisle Bay, which forms its roadstead. The inner harbour is protected by a breakwater known as the Mole Head. Founded in 1628, the town took the name Indian Bridge, and later its present appellation, from a rude aboriginal structure which spanned a neighbouring creek. The town was almost destroyed by fire in 1666, and again in 1766. In 1831 a part of Bridgetown was destroyed by a hurricane, and in 1845 it again suffered severely from fire. It is the residence of the Bishop of Barbados, and has a college, several high-class schools, town-hall, government buildings, hospital, water-works, and jail. To the south are the barracks, with parade-ground and arsenal. A short railway was completed in 1882. Pop. about 17,000.

Bridgewater. See BRIDGWATER.

Bridgewater, FRANCIS EGERTON, third DUKE OF, the 'father of British inland navigation,' was born in 1736, and succeeded his elder brother as duke in 1748. In 1762–72 he constructed, after the plans of the celebrated Brindley, the earliest canal in England, 42 miles long, uniting Worsley with Manchester and Runcorn on the Mersey above Liverpool. The canal crossed the

lwell by an aqueduct 39 feet high and 600 feet long. The duke exhausted his credit to the utmost on his undertaking, nobly restricting himself to the simplest fare for the sake of his idea, but his far-sightedness was equal to his public spirit, and great wealth ultimately flowed in upon him. The success of this canal gave an impulse to the internal navigation of England, and led to the extension of the canal-system throughout the kingdom. In 1873 the Bridgewater Canal was purchased from Lord Ellesmere for £989,612, including the plant, valued at £150,000; and in 1887 it was resold to the Manchester Ship Canal Company for £1,710,000. The duke took little part in politics, but belonged to Pitt's party. He died unmarried, March 8, 1803, and with his death the dukedom became extinct.

Bridgewater. FRANCIS HENRY EGERTON, EARL OF, son of John Egerton, Bishop of Durham, grandnephew of the first Duke of Bridgewater, was born 11th November 1753, and succeeded his brother as eighth earl, October 21, 1823. Educated for the church, he had previously been prebendary of Durham. He died unmarried, February 11, 1829, and the title became extinct. By his last will, dated February 25, 1825, he left £8000, invested in the public funds, to be paid to the author of the best treatise 'On the Power, Wisdom, and Goodness of God, as manifested in the Creation,' illustrating such work by such arguments as the variety and formation of God's creatures in the animal, vegetable, and mineral kingdoms, the effect of digestion, the construction of the hand of man, and by discoveries, ancient and modern, in arts, sciences, and the whole extent of literature. The then president of the Royal Society of London, Davies Gilbert, to whom the selection of the author was left, with the advice of the Archbishop of Canterbury, the Bishop of London, and a friend of the earl, resolved that the money should be allotted to eight different persons for eight separate treatises. The earl also left upwards of £12,000 to the British Museum, the interest to be employed in the purchase and care of MSS.

The BRIDGEWATER TREATISES are: (1) *The Adaptation of External Nature to the Moral and Intellectual Constitution of Man*, by Thomas Chalmers (1833); (2) *Chemistry, Meteorology, and Digestion*, by William Proutt, M.D. (1834); (3) *History, Habits, and Instincts of Animals*, by Kirby (1835); (4) *Geology and Mineralogy*, by Dean Buckland (1837); (5) *The Hand, as evincing Design*, by Sir Charles Bell (1837); (6) *The Adaptation of External Nature to the Physical Condition of Man*, by J. Kidd, M.D. (1837); (7) *Astronomy and General Physics*, by Whewell (1839); (8) *Animal and Vegetable Physiology*, by P. M. Roget, M.D. (1840). All these works were afterwards republished in Bohn's Scientific Library.

Bridgman, LAURA. This famous blind-mute was born in Hanover, New Hampshire, U.S., on the 21st December 1829. She was a bright, intelligent child, but at two years of age was seized with a violent fever, which utterly destroyed sight, hearing, and sense of smell, while her sense of taste was also impaired. For a time this so shattered her system that there seemed no hope of recovery; but she rallied, and soon learned to find her way about the house and neighbourhood, and even learned to sew and to knit a little. At the age of eight Dr Howe of Boston undertook her care and education at the Perkins Institution for the blind. The first attempt was to give her a knowledge of arbitrary signs, by which she could interchange thoughts with others. Then she learned to read embossed letters by the touch; next, embossed words were attached to different

articles, and she learned to associate each word with its corresponding object. Thus far, however, the work was only an exercise of imitation and memory; but at last the truth flashed upon her, that by this means she could communicate to others a sign of what was passing in her own mind. Her whole being seemed changed. The next step was to procure a set of metal types, with the letters cast at the ends, and a board with square holes for their insertion, so as to be read by the finger. In three months she could write down the name of most common objects, and in two years had made great bodily and mental improvement. She grew happier, and enjoyed play like other children, amusing herself with imaginary dialogues. Her touch grew in accuracy as its power increased; she learned to know people almost instantly by the touch alone. In a year or two more she was able to receive lessons in geography, algebra, and history; and learned to do needlework and various household duties. She received and answered letters from all parts of the world, and was always employed, and therefore always happy. She learned to write a fair, legible, square hand, and to read with great dexterity, and at last, even to think deeply on religious and other subjects, and to reason with good sense and discrimination. She afterwards became skilful as a teacher of the blind and deaf and dumb, and died 24th May 1889. Dickens gave some account of her in his *American Notes*; and see works on her by Miss Lamson (1878), and by the two daughters of Dr Howe (1904).

Bridgnorth (formerly *Brug* or *Bruges* = Bridge), a municipal borough of Shropshire, 19 miles SE. of Shrewsbury. The Severn divides it into the upper or 'High Town,' and lower or 'Low Town.' The former is built on a red sandstone rock rising 180 feet above the right bank of the river. This rock was formerly crowned by a royal fortress, a huge leaning fragment being all that now remains of the keep. The walk round the castle-hill was said by Charles I. to be 'the fairest in his dominions.' Bridgnorth has two parish churches, a grammar-school existing in Henry VIII.'s reign, carpet, worsted, and tanning industries, and agricultural trade. Until 1868 it sent two members, and until 1885 one member, to parliament. The Danes wintered here in 896, and the site of a Saxon castle, built by the princess Ethelfleda, is still distinctly marked. Early in the 12th century, Robert de Belesme (a kinsman of the Conqueror) built the Norman castle, and unsuccessfully defended it against Henry I. It was also besieged by Henry II. and Edward II. According to Shakespeare (*Henry IV., Part I., III. iii.*), Bridgnorth was the meeting-place of the royal forces before the battle of Shrewsbury; and, according to Clarendon, before the battle of Edgehill. The castle was demolished by the Parliamentarians after a three-weeks' siege, during which the 'High Town' was destroyed by fire, one of the few houses surviving being the fine old Tudor mansion, still standing, in which Bishop Percy was afterwards born (1728). To recompense the inhabitants, Charles II., by proclamation, authorised them to make a special collection in every church throughout the kingdom. High Town and Low Town are connected by an inclined railway (1892). Pop. 5000.

Bridgwater, a municipal borough and seaport town of Somersetshire, on both sides of the Parret, 6 miles in a direct line, and 12 by the river, from the Bristol Channel, and 29 miles SW. of Bristol. It stands on the border of a plain between the Mendip and Quantock Hills, in a well-wooded country. It is chiefly built of brick, and an iron bridge connects it with the suburb of Eastover. St Mary's Church has a remarkably graceful

spire, and contains a fine altar-piece. The Parret admits vessels of 700 tons up to the town; it rises 36 feet at spring-tides, and is subject to a bore or perpendicular advancing wave, 6 or 8 feet high, often causing much annoyance to shipping; a canal gives water communication with Taunton. Bath or scouring bricks, of which Bridgwater has a monopoly, are made here of a mixture of sand and clay found in the river, and there are carriage-works and potteries. Coal, grain, wine, hemp, tallow, and timber are imported; while bath-bricks, earthenware, cement, and agricultural produce are exported. The Conqueror granted the manor to one Walter de Douay, and its name thereupon became *Brigge-Walter*, of which *Bridgwater* is a mere corruption. A castle was built here in the reign of John, and an Augustinian abbey about 1230. Admiral Blake was a native of this town, which suffered severely in the civil wars, when besieged for a whole week by Fairfax, and forced to surrender, the castle being dismantled. The battle of Sedgemoor (q.v.) was fought in 1685 near Bridgwater, whose corporation had proclaimed the Duke of Monmouth as king. Bridgwater formerly returned two members to parliament, but was disfranchised in 1870. Pop. 16,000. See books on the history of the town by Jarman (1889) and A. H. Powell (1908).

Bridle and Bit, that part of a horse's harness which is attached to the head and mouth, by means of which he is governed and restrained. The proper biting of horses has been a matter of much study in England, and innumerable kinds of bits have been introduced for the purpose. It will be sufficient for our purpose, however, to describe only a few of those most generally used.

Fig. 1.

a, headstrap; b, front; c, cheek-piece; d, throat-band; e, nose-band; f, reins.

There are several forms of the snaffle-bit. The common riding form (fig. 2, a) is a round smooth bit, jointed in the middle, attached at either side to straight bars or cheeks, which prevent the bit being pulled through the horse's mouth, and with rings to which the reins and cheek-pieces of the headstall are fixed. The twisted snaffle has the mouthpiece twisted or fluted, increasing its severity on the horse's mouth. The ring snaffle is made without cheeks; and the rings for headstall and reins are not fixed, but work loose in holes at the ends of the mouthpiece. Another form which is very generally used, especially in driving, is the double-ring snaffle (fig. 2, b), having two rings at either end, one working within the other, to one of which the reins are fastened, and to the other the headstall. The snaffle being jointed, its action is to press on the sides or *bars* of the lower jaw, and not on the tongue, while its shape prevents anything like severity.

The double or Weymouth bridle is generally used in the hunting-field and often for ordinary purposes.

It has two separate bits, the snaffle and curb, or bridoon and bit, each having separate headstalls and reins. The snaffle or bridoon is like the plain ring snaffle already described. The bit or curb (fig. 2, c) has a fixed unjointed mouthpiece having

Fig. 2.

an upward curve, or *port*, of varying size, in the centre, which answers the same purpose as the joint in the snaffle of confining the pressure of the bit to the *bars*, where it is most effective. Hooks are fixed to the upper end of the cheeks, on which the curb-chain is hung, and which is passed round the chin-groove under the horse's under-jaw. To the lower end the curb-reins are attached; the other reins are fastened to the bridoon-rings. One advantage of the double bridle is that its action can be varied according as the curb or snaffle rein is tightened or relaxed. Military bridles are double, and generally similar to that just described, except that the cheeks are made in the form of the letter S, and other ornamentation added.

The Pelham is an extensively used modification of the double bridle. It consists of a single bit (fig. 2, d) similar in form to the curb-bit of the double bridle, but with the addition of rings fixed to the cheeks at either end of the mouthpiece to which reins are attached, in addition to those fixed to the lower end. The curb-chain is adjusted as in the double bridle. The running martingale is an arrangement applicable to any bridle, by which a pair of reins run through rings at the ends of two straps attached to the horse's girth to prevent him throwing his head up.

In connection with driving-bridles, two questions have in recent years caused considerable discussion—viz. *bearing-reins* and *blinkers*. The bearing-rein, in its simple form, is intended as a support to the horse's head, and consists of a strap buckled to the ring of the bridoon-bit of a double bridle, passed through a swivel on the throat-band, and fastened to a ring on the saddle-pad. In its severe form, known as the 'gag,' it is attached to the headpiece, passes through the bridoon-ring, through a swivel on the throat-band, and then to the saddle. The effect is to cramp the horse's neck, and prevent him throwing his nose forward, but it is supposed to improve his appearance in a carriage. The opponents of the bearing-rein complain of the torture unnecessarily inflicted on the horse, and hold that nature supplies all the support necessary for the head. The blinker question is not so important, and consists of a difference of opinion as to whether a horse would or would not be more easily startled with his eyes uncovered.

In European nations and in North America, the bridles used are generally similar to those described; but among the Arabs and in South America and some parts of Mexico and Texas, a heavy, old-fashioned, and terribly cruel curb-bit is used. On the other hand, the stockmen of the Australian bush employ the plain snaffle-bridle alone, with which they manage their powerful and usually half-broken horses easily, an equal tribute to the

sufficiency of the snaffle and their own horsemanship.

It is interesting to know that in the representations of harnessed horses in the Assyrian sculptures the bridle generally shown is apparently almost

Fig. 3.

identical with the modern snaffle. Fig. 3 represents a chariot horse with bridle (Koyunjik); a, a bronze bit from Nimroud. See Major Dwyer's *Seats and Saddles, Bits and Bitting*; Stonehenge's *Horse in the Stable and Field*. See also the articles HORSE, RIDING.

Bridlington, or **BURLINGTON**, a town in the East Riding of Yorkshire, 6 miles SW. of Flamborough Head, and 23 SSE. of Scarborough. An old-fashioned place, with narrow irregular streets, and with a considerable trade in corn, it is supposed to have been the site of a Roman station. From 1664 till 1753 it gave title of Earl of Burlington in the peerage of England to the Boyle Earls of Cork. An Augustinian priory of immense wealth, founded in the reign of Henry I., is represented by the nave of its splendid church, which, mixed Early English and Perpendicular in style, was restored by Sir Gilbert Scott in 1857. On Bridlington Bay, a mile to the south-east, is Bridlington Quay, the port of the town, which has risen into repute as a watering-place, has fine sands, a parade, ornamental gardens, a chalybeate mineral spring, and hot and cold baths. The bay has good anchorage, and the harbour is inclosed by stone piers. In 1643 Henrietta, queen of Charles I., landed here from Holland with arms and ammunition bought with the crown-jewels, when Bridlington was cannonaded for giving her refuge. Bridlington is noted for its chalk-flint fossils. Hundreds of windbound vessels may sometimes be seen in Bridlington Bay, stretching north to Flamborough Head, which affords good shelter and anchorage. Pop. (municipal borough) 23,000.

Bridport, a municipal borough of Dorsetshire, at the confluence of the Asker and the Brit, 2 miles from the English Channel, and 16½ W. of Dorchester by rail. It stands on an eminence surrounded by hills, and consists chiefly of one spacious street running east and west, and of another stretching towards the sea. It has a town-hall (1785), and a good cruciform parish church (restored in 1865). Till 1867 Bridport returned two members to parliament; and till 1885, one. The chief manufactures are ropes and cordage (a 'Bridport dagger' was proverbial for a halter in Leland's day), besides twine, shoe-thread, fishing-nets, and sailcloth. Bridport was a considerable town before the Norman Conquest, and had a mint for coining silver. Vessels of 250 tons can enter the harbour, which is 1½ mile below the town; and there is some foreign and coasting trade, timber, coal, and flax being imported. Pop. 6000.

Brief, or **BREVE**, **PAPAL** (from Lat. *brevis*, 'short'). The word breve was originally used in

the Low Latin of the middle ages for ecclesiastical documents of various kinds—e.g. for inventories of church goods. It now signifies such papal documents as are issued without some of the solemnities proper to bulls, and which assumed a recognised name and form in the 15th century. They were introduced in order to lighten the work of the papal chancery. The brief is written on a sheet of thin white parchment, of greater breadth than height, in current Latin characters. It has a stamp of red wax bearing the impress of the fisherman's ring—i.e. a figure of St Peter hauling in his net, surmounted by the name of the pope. The name of the pope also appears on the first line of the brief, then follows 'Dilecte fili (or the like), salutem et apostolicam benedictionem,' 'In perpetuum,' &c., being sometimes added as in bulls. It ends with the words 'given at Rome at St Peter's under the ring of the fisherman,' followed by the day of the month (not as in bulls according to the old Roman, but according to the modern mode), the year of the Christian era and of the pontificate. It is subscribed by the secretary of briefs. A comparison with the article **BULL** will show the difference between the two kinds of documents, which has been considerably lessened by the legislation of Pope Leo XIII.

Brief, in the practice of the English bar, is the name given to the written instructions on which barristers advocate causes in courts of justice. It is called a brief because it is, or ought to be, an abbreviated statement of the pleadings, proofs, and affidavits at law, or of the bill, answer, and other proceedings in equity, with a concise narrative of the facts and merits of the plaintiff's case, or the defendant's defence. Probably, when pleadings were entirely oral, nothing was handed to counsel except the brief or writ originating the action. The brief is often called 'observations' in Chancery proceedings. In Scotland, the corresponding term is *Memorial*. *Breve* (q.v.) in Scotland has a different meaning. This paper should be confined to the statement of facts without argument or quotation. —*Kings' Briefs* were royal mandates ordering collections to be made in chapels for building churches, relieving sufferers by fire, refugees, and suffering Protestants abroad.

Brieg, a town of German Silesia, on the left bank of the Oder, 27 miles SE. of Breslau by rail. The 13th-century church of St Nicholas has a splendid organ and towers added in 1884–85. Brieg manufactures machinery, ironwares, thread, sugar, leather, tobacco, &c. Pop. 26,000.

Briel, or **BRIELLE**, sometimes **THE BRILL**, a fortified seaport town of south Holland, situated on the north side of the island of Voorne, near the mouth of the Maas. It contains a government arsenal and military magazines, and possesses a good harbour. The tower of St Peter's Church serves as a lighthouse. Pop. 4000, most of the men engaged as pilots and fishermen. Briel may be considered as the nucleus of the Dutch republic, having been taken from the Spaniards by William de la Marck in 1572 (see **HOLLAND**). Admiral Tromp was a native.

Brienne-le-Château, a small town in the French department of Aube, on the right bank of the river Aube, 35 miles ENE. of Troyes. At the military school here (suppressed in 1790) the great Napoleon spent five years. Here, too, he was defeated by the allies, after a desperate struggle, in the last days of January 1814. This victory opened the way to Paris, and led to the fall of the empire.

Brien, a Swiss town, beautifully situated at the foot of the Bernese Alps, on the north-east shore of the lake of the same name, 30 miles ESE.

of Bern; pop. 3000.—The pretty lake of Brienz, which is $\frac{5}{8}$ miles long and $1\frac{1}{2}$ in breadth, is an expansion of the river Aar, and is believed to have been at one time united with Lake Thun. It lies 1857 feet above the sea, is 859 feet deep at one point, and is surrounded by lofty mountains, the principal of which is the Rothorn.

Brierley, BENJAMIN (1825-96), a Manchester weaver who read industriously in the English poets, and from 1855 onwards made a name for himself as a writer of Lancashire stories and verses, many of them in the Lancashire dialect.

Brierley Hill, a town of Staffordshire, $2\frac{1}{2}$ miles NE. of Stourbridge. The district abounds in coal, iron, and fireclay; there are collieries, iron-works, glass-works, brick-works, and potteries. Pop. 12,500.

Briex, EUGENE (born in Paris in 1858), by his comedies and plays—of which *Maternity*, *The Three Daughters of M. Dupont*, and others have been translated—earned a seat in the Académie Française and a reputation as Augier's successor, a gifted dramatist and a powerful censor morum.

Brig, a square-rigged vessel with two masts. A brigantine, or hermaphrodite brig, has the mainmast of a schooner and the foremast of a brig.

Brig.

A brig's mainsail is the lowest square-sail on the mainmast, whereas the mainsail of a brigantine is a fore-and-aft sail like that of a schooner.

Brigade, in its proper military sense, is a tactical and administrative group of battalions or regiments or batteries, commanded by one superior officer (see **BRIGADIER**). In most modern armies an infantry brigade consists of two regiments, but in Britain it has four battalions, three of such brigades supplying the infantry of a division. In a cavalry brigade there are three regiments, four of such brigades in the British army forming, in war, a cavalry division. Only in recent years have these brigades been permanent units in peacetime. Brigade of Guards is the term applied to the regiments of Foot Guards. The regiments of Life Guards and Horse Guards (see **GUARDS**) are called Household Brigade. Two new units, the Mounted Brigades, were recently instituted, consisting of two regiments of cavalry and one battalion of mounted infantry, with a battery of horse artillery. Artillery is also grouped into brigades, both administratively and tactically—horse artillery, 2 batteries; field artillery, 3 batteries; medium siege artillery, 4 batteries; heavy, 2 batteries. The commissioned staff of an infantry brigade has an aide-de-camp, a brigade-major, and a staff-captain. In India there are 36 infantry brigades. A mixed

brigade is a force of 2000 to 5000 men, containing more than one arm.

Brigade-major is a military staff-officer who exercises duties, in a brigade, analogous to those of the Adjutant (q.v.) of a battalion. The appointment is held for four years, and is nearly always held by officers who have passed through the Staff College (q.v.). This holds also for the Territorial Army. When temporary brigades or mixed brigades are formed on manoeuvres or in war, their commander is provided with a brigade-major.

Brigadier, or **BRIGADIER-GENERAL**, is the commander of a Brigade (q.v.). It is not a permanent rank; the officer, on vacating the command, reverts to colonel, if not promoted. In all armies the rank is next below that of major-general, but a brigade is often commanded by a colonel or a major-general. At large stations where there are one or more divisions, and where a lieutenant-general or general is in command, the brigadier usually commands a brigade proper of infantry or cavalry, but at other places an officer of this rank is often in command of a mixed force of more than one arm. This also happens in the case of detachments in war. In India the sub-districts called brigade commands have a mixed force, and are under colonels with the temporary rank of brigadier-general, which may be held for five years or until promotion. The rank of brigadier-general in the British army was abolished in 1920. That of colonel commandant answers to it.

Brigandine, a coat of mail worn during the middle ages, made of small plates of iron, sewed upon quilted linen or leather, and covered with a similar substance to hide the glittering of the metal. The brigandine was named after the *Brigands*.

Brigands (Ital. *brigante*, from *briga*, 'an intrigue or quarrel'), a name originally given to the mercenaries who held Paris during King John's imprisonment (1358), and who made themselves notorious for their ill-behaviour. It was applied by Froissart to a kind of irregular foot-soldiery (see **BRIGANDINE**), and from them was transferred to simple robbers; it is now used especially of such of these as live in bands in secret mountain or forest retreats. In this sense, the pest has been common to most countries, by whatever name the robbers may have been known—whether the escaped slaves and gladiators of Rome, the pre-Islamite brigands of Arabia, English outlaws and highwaymen, German robber-nobles, the later banditti of Mediterranean countries and of Mexico, American stagecoach robbers, Australian Bushrangers (q.v.), or the dacoits and hill-robbers of Asia. It has ever flourished under weak or corrupt governments, and patriotism at times has swelled its ranks, always largely recruited from those disposed readily to join in any political movement, and has transformed them into guerilla companies, who have carried on a bitter warfare against the invader. Such Spanish bands harassed the French during the Peninsular war; in Italy, the Austrian troops were frequently engaged in expeditions against the banditti led by the daring Bellino ('Il Passatore'); and in Greece, the Klephts rendered brave and worthy service in the war of independence. In Cuba, in 1888, political discontent was made the excuse for the brigandage then rampant in the island, where four provinces were on this account declared in a state of siege. Religious persecution also has encouraged brigandage; in Bosnia, which for centuries produced the most perfect specimens of bandits, it was formerly very common, the unhappy Christians, who were reduced by the Turks to the condition of serfs, frequently taking to the mountains in despair, and thence wreaking vengeance on their oppressors. Gener-

ally speaking, in countries with a notably scanty population, which is yet in many districts as notably overcrowded, brigandage is, or was recently, in existence. In Hungary, where brigandage had flourished from time immemorial, and where even the free towns in the 15th century enrolled companies for organised rapine, it found a stronghold in the shades of the Bakony Forest. Vigorous steps have been taken since the middle of the 19th century to repress the practice, and in some countries with signal success. In Greece organised companies of brigands, as distinguished from bands of highway robbers fortuitously collected, have disappeared; and in Italy the chiefs with whom princes made treaties are found only in history. Even in Sicily brigandage is all but extinct. Examples of those forms of brigandage that spring up on a racial and on a national frontier are both afforded by Scottish history. The Highland caterans used to plunder their Lowland neighbours or exact blackmail for their forbearance; while the Border reivers, accustomed to drive cattle across the Border, did not scruple to make raids on their own countrymen, as when the Liddesdale men, having 'nearhand herried hale Ettrick Forest and Lauderdale,' turned their attention upon Lothian.

Brigantes, the most powerful of the old British tribes, inhabiting, with subject tribes, the country from the Trent to the Forth, or possibly the Perthshire Almond.

Brigantine. See **BRIG.**

Brigantium, Brigantion, Latin and Greek names of Betanzos, Bregenz, and Briançon.

Briggs, HENRY, a distinguished mathematician, was born in 1561, at Warley Wood, near Halifax, Yorkshire, and studied at St John's College, Cambridge. He took the degree of B.A. in 1581, that of M.A. in 1585, and obtained a fellowship in 1588. In 1592 he was appointed reader of the Physic Lecture founded by Dr Linacre, and in 1596 first reader in geometry at Gresham House (afterwards College), London, and in 1619 first Savilian professor of Astronomy in Oxford. This office he retained till the time of his death, which took place at Oxford, January 26, 1631. Briggs made an important contribution to the theory of logarithms, of which he constructed invaluable tables. Napier the inventor had in 1614 published a table of the so-called natural logarithms, when Briggs observed that another system, in which the logarithm of 10 should be taken as unity, would afford great facilities of calculation. In 1616 he visited Napier at Edinburgh to discuss the suggested improvement, and again in the following year, when Napier admitted the improvement on his own system. He published his *Logarithmorum Chilias Prima* in 1617, containing the first thousand natural numbers calculated to eight decimal places. He was also the author of a tract on the *North-west Passage to the South Seas*, by way of Virginia and Hudson Bay (1622); and in 1624 he published his *Arithmetica Logarithmica*, the fruit of many years of unwearied application, and giving the Logarithms (q.v.) of 30,000 natural numbers to fourteen places of figures, besides the index. His system of logarithms is that now commonly adopted. He next employed himself on a Table of Logarithms of sines and tangents, carried to the hundredth part of a degree, and to fifteen places, which, with a table of natural sines, tangents, and secants, was printed at Gouda, in Holland, in 1631, and published in London in 1633, under the title of *Trigonometria Britannica*. The Greek epitaph written on him by Henry Jacobs, finishes by saying that his soul still astronomises and his body geometrises.

Bright, JOHN, a politician, first brought into notice by the Anti-Corn-Law agitation,

son of Jacob Bright, a cotton-spinner and manufacturer at Rochdale, Lancashire, was born at Greenbank, near that town, November 16, 1811. The family were members of the Society of Friends, and Bright was educated at a Friends' school at Ackworth, and afterwards at York and at Newton. While in his father's factory he took a great interest in public questions, and before he had attained his majority spoke upon such subjects as capital punishment, church rates, temperance, and parliamentary reform. In 1835 he made a foreign tour, which included a journey to Palestine, and on his return delivered before a literary institution at Rochdale, of which he was one of the founders, lectures on the subject of his travels, and on topics connected with commerce and political economy. When the Anti-Corn-Law League was formed in 1839 he was one of its leading members, and, with Cobden, engaged in an extensive Free-trade agitation throughout the kingdom. In the spring of 1843 he offered himself as a candidate for the representation of Durham, and though at first unsuccessful, he became in July of the same year M.P. for that city. At all times an animated and effective speaker, Bright was incessant, both at public meetings and in parliament, in his opposition to the Corn Laws, until they were finally repealed. In 1845 he obtained the appointment of a select committee of the House of Commons on the Game Laws, and also one on the subject of cotton cultivation in India. An abridgement of the evidence taken before the former, published in one volume, contained from his pen an *Address to the Tenant Farmers of Great Britain*, strongly condemning the existing Game Laws. At the general election of 1847 he was elected one of the members for Manchester. He co-operated with Cobden in the movement in favour of financial reform. On the formation of the first Derby ministry, February 27, 1852, Bright aided in the temporary reorganisation of the Corn-Law League, in favour of the principles of Free-trade; and at the general election which followed, was re-elected for Manchester. Like Cobden a member of the Peace Society, he energetically denounced the policy of the Crimean war (1854). A severe illness compelled him to withdraw for a time to the Continent, and in his absence he was rejected by Manchester. Elected in 1857 for Birmingham, he seconded the motion against the second reading of the Conspiracy Bill, which led to the overthrow of Lord Palmerston's government. Mr Bright advocated the transference of India to the direct government of the crown, together with other reforms affecting our eastern dependency. When the civil war in America broke out, he warmly supported the cause of the North, although his own business and the whole of the Lancashire cotton-trade suffered severely in consequence. His name next became chiefly associated with the movement for reforming the electoral representation, which resulted in the Act of 1867. In 1868 he accepted office as President of the Board of Trade, but in 1870 was again obliged to retire in consequence of severe illness. His health having been restored, he took office in 1873, and again in 1881, as Chancellor of the Duchy of Lancaster; he was appointed Lord Rector of Glasgow University in November 1880. Mr Bright retired from the Gladstone ministry in 1882, being unable to support the government in its Egyptian policy. His appearances in public were afterwards infrequent; but in 1883 he defended himself in the House of Commons from a charge of breach of privilege in connection with speeches delivered at Birmingham. His completion of 25 years of service to this town was marked by a series of popular demonstrations there, in June 1883. In 1886-88 he opposed the Home Rule policy of Mr

Gladstone. He was one of the most eloquent public speakers of his time. He died 27th March 1889.

A collection of his speeches was published in 1868; Lives by Robertson (1877), R. Barry O'Brien (1910), and G. M. Trevelyan (1913); his Life and Speeches, 2 vols., by G. Barnett Smith (1881); and his *Public Letters* (ed. by Leech, 1885).

Bright, RICHARD, physician, was born at Bristol, 28th September 1789, and studied at Edinburgh, Berlin, and Vienna, and from 1820 was connected with Guy's Hospital. He died 16th December 1858. He made many important medical observations (see BRIGHT'S DISEASE) and wrote numerous medical dissertations. His *Travels through Lower Hungary* (1818) contains a valuable account of the Gypsies.

Brighton, a parliamentary and county borough and fashionable watering-place in East Sussex, 50½ miles S. of London by rail. Its former name, *Brighthelmstone*, was superseded in the 19th century by *Brighton*, which occurs, however, as early as the 14th. The town is built on a slope ascending eastward to a range of high chalk cliffs; to the west these hills recede from the coast; and within easy reach in the South Downs is the Devil's Dyke, 5 miles distant. Hove, Portslade, Southwick, and Shoreham continue the town westwards. Ancient Brighthelmstone was a mere fishing-village on a level under the cliff. It suffered much at the hands of French, Flemings, and Spaniards, and still more from the sea, whose inroads in 1699, 1703, and 1706, undermined the cliffs and destroyed many houses. During excavations in 1818 the walls of some of the old streets were found under 15 feet of beach. Further inroads are prevented by a sea-wall of great strength (60 feet high and 23 feet thick at the base), extending along the east cliffs, and built between 1827 and 1838 at a cost of £100,000, the money being raised by the imposition of a duty on all coal entering the town. This duty was abolished in 1887, the whole of the debt having been paid off. The writings of Dr Richard Russell, a celebrated physician, first drew public attention about 1753 to Brighton as an eligible watering-place, and the discovery of a chalybeate spring in the vicinity increased its popularity. Dr Johnson in 1770 described the country as 'so desolate, that if one had a mind to hang one's self for desperation at being obliged to live there, it would be difficult to find a tree on which to fasten a rope.' Now the growth of trees is encouraged, and they have been freely planted both in and around the town. The visit of the Prince of Wales in 1782, and his subsequent yearly residence there, finally opened the eyes of the fashionable world to Brighton's immense attractions, and it thenceforth became the crowded resort of a health-seeking population, in which the opening of the Brighton Railway in 1841 greatly assisted. It was made a parliamentary borough in 1832, a municipal one in 1854; its progress has been very rapid, and the town is still steadily increasing. Brighton is for the most part extremely well built, as becomes a favoured retreat of wealth and aristocracy. It mostly consists of new and elegant streets, squares, and terraces. Kemp Town, as the east end of Brighton is called, has a famous crescent and square. The public hotels are magnificent; besides these there are the boarding-houses and many hundreds of lodging-houses. A range of splendid houses fronts the sea for upwards of 4 miles, the promenade—asphalted from end to end, and exceptionally well lighted—being almost on a dead level, within a few feet of the sea, for the greater part of its length, but rising at the east end of the town to a height of 60 feet, on the top of the sea-wall already referred to. Beneath this is the Madeira Road, a fine drive and promenade a mile in length,

sheltered effectually from the north wind. The population is greatly increased during the fashionable season by the influx of many thousands of visitors, chiefly from London, for which reason it is sometimes called London-super-Mare. There are more than thirty churches, that of St Nicholas, dating from the time of Henry VII., and restored in 1853, being the only ancient building, and more than fifty chapels. Holy Trinity Church has been rendered famous from the ministry of F. W. Robertson. The public buildings include the town-hall, the town-hall in the adjoining borough of Hove (part of the parliamentary borough, but not included for municipal purposes), the unrivalled aquarium (1872), library and art gallery, museum, school of science and art, Brighton college, theatre, Sussex county hospital, workhouse, blind asylum, various bathing establishments, and an abundant supply of good schools. At Queen's Park, in the east of the town, is the German Spa establishment, and at St Anne's well and wild gardens, in the west, is a chalybeate spring. In the north of the town is the Preston public park of 67 acres, which was opened in 1884, and cost £50,000, the money being left to the town by the 'leviathan' bookmaker, Mr W. E. Davies (1819-79). Hollingbury Park (240 acres) is near the north boundary.

Near the centre of the town is the Royal Pavilion or Marine Palace, a fantastic oriental or Chinese structure, with domes, minarets, and pinnacles, and Moorish stables, begun for the Prince of Wales in 1784, and finished in 1827. It was purchased in 1850 for £53,000 by the corporation, and with its fine pleasure-grounds it is devoted to the recreation of the inhabitants. The concert-hall known as the 'Dome,' formerly the royal stables, can accommodate 3000 people. Adjoining are the public library and museum and picture-gallery. The site of the Pavilion is in the Steyne Valley, which is practically in the centre of the Brighton sea-front, and the starting-point of the main road to London. The Marine Parade is an esplanade extending some three or four miles along the coast. The famous Chain Pier (1823), 1136 feet in length, was destroyed by a storm in 1896; the much wider West Pier (1866) is 1350 feet long; the Palace Pier, completed in 1900, near the site of the old Chain Pier, is 1700 feet long. Numerous groynes to intercept the shingle constantly moving from west to east, and thus protect the promenade, intersect the beach from north to south. Most of these are of stout timber, but two are costly concrete structures, 21 feet wide at the top, and these are favourite promenades. Brighton has no maritime trade, but there is some mackerel and herring fishing. The water-supply, which is in the hands of the corporation, and has cost £450,000, is derived from the chalk, and is practically inexhaustible. The Municipal School of Art, erected in 1876, was extended in 1911. The Municipal Technical College was opened in 1898, and extended in 1906. The electric power station at Southwick (outside the borough) yields a large profit to the town, which has electric tramways and lighting. The suburb of Preston is incorporated with the municipal borough; Hove, in the parliamentary borough, which returns two members, received a separate municipal charter in 1898. Pop. (1801) 7339; (1821) 24,429; (1841) 46,661; (1861) 77,693; (1881) 107,546; (1891) 115,873; (1911) 131,237; (1921) 142,427; of parliamentary borough, 188,946.

See works on Brighton by Erredge (1862), J. Bishop (1875-95), Sawyer (1878), Sala (1895), Lewis Melville (1909); and on the 'Brighton Road' by C. G. Harper (1892).

Brighton, a watering-place of Victoria, on Port Phillip Bay, 8 miles S. of Melbourne; pop. 11,000.

Bright's Disease (of the kidneys), so called after Dr Richard Bright (q.v.), who first investigated its character. In 1827 he published a work in which he showed that dropsy is frequently associated with inflammatory changes in the kidneys, and an abnormal condition of the urine. When we apply heat or certain chemical reagents to the urine in such a case, it becomes opaque, showing that it contains *Albumen* (q.v.); and on examining the sediment under the microscope, we see exuded material mixed with epithelium in the form of casts of the small ducts of the diseased organ. Further research has shown that these conditions of the urine occur in connection with several distinct affections of the kidney, varying much in duration, severity, and danger to life; and, while Bright's disease is retained as a generic term for the whole group, more precise names are applied to the several diseases included in it—e.g. acute nephritis, chronic nephritis, and fibrotic or granular kidney. See KIDNEY (DISEASES OF).

Brigitta. See BRIDGET.

Brignoles, a town in the French department of Var, 42 miles ESE. of Aix by rail. A very salubrious place, it has a trade in wines, brandy, olives, and prunes. Pop. 3000.

Brihuega, a town of New Castile, Spain, on the Tajuña, 20 miles ENE. of Guadalajara; pop. 2600. Here in 1710, during the War of the Succession, the English general Stanhope, owing to the dilatoriness of his allies in affording him support, was defeated by the Duke de Vendôme, and compelled to surrender, with all his force, amounting to about 5500 men.

Bril, the name of two landscape painters, both natives of Antwerp.—**MATTYS BRIL** (1550–84) went during his youth to Italy, and, under the patronage of Pope Gregory XIII., painted several frescoes in the Vatican. He was also distinguished as an historical and landscape painter.—His more celebrated younger brother, **PAUL BRIL** (1556–1626), received instruction under Mattys in Rome, and soon excelled his master. The works of his riper age exhibit high poetical qualities, and a fine appreciation of the effects of light in the sky, which have been described as but little inferior to those of his great successor, Claude Lorraine. They have a character of solemn rest and calmness, and at times even an elegiac tone of melancholy, which well accords with representations of the glories of fallen Rome.

Brill, a Dutch port. See BRIEL.

Brill (*Rhombus levis*), a common flat fish on British and other European coasts, belonging to the same genus as the Turbot (q.v.), from which it is distinguished by its being much less high in proportion to length, by the absence of bony tubercles, by the small, almost smooth scales, by the different curve of the lateral line, by the reddish-brown spots on the grayish brown of the 'upper' side, &c. It is seldom above 8 lb. in weight, is much eaten, but lacks the firmness and delicacy of turbot.

Brillat-Savarin, **ANTHELME**, French gastronomist, born at Belley, 1st April 1755, was a deputy in 1789, and mayor of Belley in 1793; he resided for a time in Switzerland, and afterwards in America, where he played in the orchestra of a theatre in New York; and from 1796 until his death, 2d February 1826, he was a member of the Court of Cassation. Shortly before this event, appeared his *Physiologie du Gout* (1825), an elegant and witty compendium of the art of dining, to which he brought the experience of half a century. It has been repeatedly republished and translated; the latest English form is *A Hand-*

book of Gastronomy, with 52 etchings by Lalauze (1884).

Brilliant is a popular name given to the diamond when cut in a particular way. See DIAMOND.

Brimstone ('a stone that burns'; from Anglo-Saxon *byrnan*, 'to burn,' and 'stone') is the commercial name for Sulphur (q.v.) in sticks or rolls.

Brindāban, or **BINDRABAN**, a town of the United Provinces of Agra and Oudh, on the Jumna, 6 miles N. of Muttra. It is one of the holiest cities of the Hindus, and crowds of pilgrims come from all parts of India, more particularly in honour of Kīshna, who passed most of his youth here; and here his mistress Radha loved to dwell. Amongst the most notable temples are those of Gobind Deva (1590), Madan Mohan, Gopinath (1580), and that of the Seths, erected between 1845 and 1851 at a cost of about £450,000. Here, as at Benares, the immediate margin of the river is occupied by flights of steps or ghauts. The inhabitants are almost exclusively Hindu. Pop. 18,000.

Brin'disi (the ancient *Brundisium* or *Brundisium*), a seaport town of Southern Italy, in the province of Lecce, is situated on a small promontory in a bay of the Adriatic Sea, 346 miles SE. of Ancona by rail. A place of very great antiquity, it was taken from the Sallentines by the Romans (267 B.C.), who some twenty years later established a colony here. It rapidly increased in wealth and importance, chiefly on account of its excellent port—consisting of an inner and outer harbour, the former perfectly landlocked, and capable of containing the largest fleets, and the latter also very well sheltered. Indeed, it soon became the principal naval station of the Romans in the Adriatic, and attained a population of 100,000. Horace has made a journey to Brundisium the subject of one of his satires (*Sat.* i. 5), and Virgil died here (19 B.C.) on his return from Greece. The city suffered greatly in the wars which followed the fall of the empire. When the Normans became possessed of it in the 11th century, the Crusaders made it their chief port for embarkation to the Holy Land; but with the decline of the crusades, the port again sank into insignificance. The city subsequently suffered greatly from wars and earthquakes. The principal buildings are the cathedral (1150), lately restored; and the castle, commenced by the Emperor Frederick II., and finished by Charles V. The neighbouring district is still remarkable for its fertility, olive-oil being largely produced. After the establishment of the Overland Route (q.v.) to India, Brindisi became a standard point of departure for passengers for the East. Since 1898, however, when the Peninsular and Oriental Company made Marseilles the starting-point of their main-line steamers, the number of passengers travelling by Brindisi has been very greatly diminished. So far as the carriage of mails is concerned, the port retains its importance. Since 1866 great quays and breakwaters have been added, and the entrance channel deepened. Brindisi exports casks, wine, figs, hats, &c. An important wireless station, with government coal and oil depots, Brindisi has manufactures of briquettes and wine and oil casks. The city is the seat of an archbishopric. Pop. 28,000.

Brindley, **JAMES**, an eminent English mechanic and engineer, born in Thomssett, near Chapel-en-le-Firth, Derbyshire, in 1716. His parents being in poor circumstances, he received very little education; he was apprenticed at seventeen to a millwright, afterwards became an engineer, and in 1752 showed great ingenuity in contriving a water-engine for draining a coal-mine. A silk-mill on a new

plan, and several others of his works, recommended him to the Duke of Bridgewater (q.v.), who employed him to execute the canal between Worsley and Manchester. This difficult enterprise was crowned with success, including the remarkable aqueduct over the Irwell at Barton, 39 feet above the river, removed in 1888, to give place to a steel aqueduct in connection with the Manchester ship-canal. Thenceforth he devoted his great skill and genius to the construction of navigable canals; commenced the Grand Trunk, and completed the Birmingham, Chesterfield, and others. He appears to have constructed or laid out 365 miles of canals. Up till the last he remained illiterate, most of his problems were solved without writings or drawings, and when anything specially difficult had to be considered, he would go to bed and think it out there. Once, when under examination before a committee of the House of Commons, being jocularly asked for what purpose he supposed rivers to have been created, he is said to have replied: 'Undoubtedly to feed navigable canals.' His life was shortened by his excessive thought and labour, and he died at Turnhurst, Staffordshire, 30th September 1772.

Brine-shrimp (*Artemia*), a genus of small crustaceans, in the Phyllopod sub-order, occurring in salt-lakes and brine-pools in the northern hemisphere. The body has eleven pairs of flattened swimming-limbs. The animals swim actively and gracefully on their backs. They are hatched at

Fig. 1.—Side View of Male Brine-shrimp (*Artemia salina*), enlarged.

the lowest level of crustacean life as nauplii (see CRUSTACEA). The full-grown animal is about half an inch long, and, having no shell, is transparent. The male has a strong embracing organ, the female a pouch-like brood-sac. The multiplication is very rapid. There are five species of *Artemia*, all found in salt-lakes or in brine-pools where salt is manufactured. Of these species the most unlike are *A. salina* and *A. milhausenii*. Schmankewitsch found that an increase in the salinity of the water containing the typical form called *Artemia salina* led to its being replaced in the course of generations by the form called *Artemia milhausenii*. He also made the converse experiment. The two forms are varieties rather than species, and are connected by intermediate stages. In respect of habitat, the brine-shrimp is indeed remarkable, occurring, as it does, in myriads, in the concentrated brine of salt-pans. The workmen at salt-pans so confidently ascribe to it the rapid clearing

Fig. 2.—Transformation of *A. salina* to *A. milhausenii*: 1, tail-lobe of *A. salina*, and its transition through 2-5 into 6, that of *A. milhausenii*. (After Schmankewitsch.)

of the brine in which it occurs that when it does not appear in their salt-pans they transport a few from other pools. See Bateson, *Materials for the Study of Variation* (1894).

Brinjal, an Anglo-Indian name for the Egg-plant (q.v.).

Brink, BERNHARD TEN, philologist, born at Amsterdam in 1841, from 1861 to 1865 studied philology at Münster and Bonn, and in 1870 became professor of Modern Languages and Literature at Marburg, in 1873 at Strasburg. Among his works (in German) are two books on Chaucer (1870 and 1884), a history of English literature (1874-93; Eng. trans. 1883-96) left incomplete, one on Beowulf (1882), and lectures on Shakespeare (1893; Eng. trans. 1895). These works are still of very great value. His work on Chaucer stimulated a revival of Chaucer study not only in Germany, but also in Britain. He died at Strasburg 29th January 1892.

Brink, JAN TEN (1834-1901), born at Appingadam, studied theology at Utrecht, but early devoted himself to literary studies. After a short residence at Batavia, he returned in 1862 to lecture on Dutch at the Hague, and earned for himself a foremost place as a critic of acuteness and insight, especially in fiction and belles-lettres. He became professor of Dutch literature at Leyden in 1884. A popular novel of his own is *Het verloren Kind* (1879). His *Causerien over Moderne Romans* (1885) is a valuable critique.

Brinkley, JOHN (1763-1835), born at Woodbridge, graduated from Caius College, Cambridge, as senior wrangler, and became in 1792 first Irish Astronomer Royal, in 1826 Bishop of Cloyne.

Brinsmead, JOHN (1814-1908), founded a London piano house in 1836.—His son EDGAR wrote a *History of the Pianoforte* (1870), and died in 1908.

Brinton, DANIEL GARRISON (1837-99), American ethnologist, was born at Thornbury, Pennsylvania. He was an army surgeon, and afterwards professor of American linguistics and archaeology in the university of Pennsylvania. His chief work is the *Library of American Aboriginal Literature* (8 vols 1882-85).

Brinvilliers, MARIE MADELEINE, MARQUISE DE, poisoner, was the daughter of Dreux d'Aubray, lieutenant of Paris, and in 1651, while still young, was married to the Marquis de Brinvilliers. A gay and careless spendthrift, he allowed her to do very much as she pleased, and even introduced to her a handsome young officer, the Seigneur de Sainte Croix, who inspired her with a violent passion. Her father caused Sainte Croix to be arrested and imprisoned in the Bastille, where he learned from an Italian the properties of arsenic. On his release he imparted his fatal knowledge to his mistress, who during his incarceration had affected the greatest piety, spending most of her time in visiting the hospitals and in attending the sick. She now resolved to destroy her father, and, to test the efficacy of the poison, tried its effects on patients in the *Hôtel Dieu*. Having satisfied herself, she commenced operations on her parent, kissing and poisoning him continually for eight months, until her diabolical patience was exhausted, and she was at last induced to administer a very violent dose. He died, and no one suspected his daughter, who, aided by Sainte Croix and a domestic, Jean Amelin or Chaussée, next poisoned her two brothers and her sisters, her object being to find means of supporting her extravagant style of living with her paramour. She made several attempts to poison her husband; but Sainte Croix is said to have given him antidotes, dreading that he should be compelled to marry the widow. Sainte Croix died suddenly in 1672—his glass mask having fallen off while he was engaged in preparing a poison—and left documents inculcating the marchioness. She escaped to England, afterwards travelled into Ger-

many, and next took refuge in a convent at Liège. From this, however, she was decoyed by an officer of justice disguised as an abbé, and conveyed to Paris. Among her papers was found a general confession of her crimes, whose truth she acknowledged after having been put to the torture, and on 16th July 1676 she was beheaded and burned at Paris (see *CHAMBRE ARDENTE*). Scribe made her the subject of a comic opera, and Albert Smith of a romance (1856). See books on her by Bauplein (1871), Toiseleur (1883), and Hugh Stokes (1911).

Brioude, a town in the French department of Haute-Loire, 34 miles SSE. of Clermont, with a 12th century Romanesque church; pop. 4000.

Briquette (*Fr.* 'small brick') is the name applied to a form of fuel made by moulding, under the combined influence of heat and pressure, a mixture of small coal with pitch, or other suitable binding material, so as to make a coherent block suitable for transport. By such means a vast amount of otherwise waste colliery slack or culm can be converted into a useful fuel for domestic and industrial purposes. The process of manufacture is quite simple in principle. The small coal, which should be previously washed free from particles of clay, shale, gypsum, pyrites, &c., is first of all well dried in some suitable form of oven, and then passed, together with the requisite proportion (6 to 8 per cent.) of pitch, through (1) a disintegrator, and (2) a vertical pug-mill, which thoroughly mixes the two ingredients. Steam is introduced into the pug-mill in order to soften the binder and render it viscid and adhesive. The mixture, thus thoroughly amalgamated, is then forced from below into brass-lined moulds fixed on a vertical revolving table by rams, exerting a pressure of 20 lb. or more per square inch. After half a revolution of the table the contents of the mould are further pressed by a plunger, up to a pressure of 2 tons per square inch in some cases. After another quarter-revolution of the table the briquette is pushed out of the mould on to an endless band and cooled by a current of air from a fan. The briquettes are usually rectangular in shape, a convenient size being 6×5×4 inches (although larger are made), weighing about 7 lb. each. The specific gravity averages 1.2 and weight 50 lb. per cubic foot. The calorific value is somewhat higher than that of the coal from which the briquette is manufactured. Briquettes are chiefly used in Britain for domestic consumption, but in certain parts of America and Europe they are largely employed as locomotive fuel on the railways. Extensive experiments have been made under government auspices in the United States on the subject of briquetting (see U.S. Bureau of Mines, *Bulls.* 343, 385; and U.S. Geol. Survey Report on the Coal-testing Plant at the St Louis Exposition, 1904, part iii.).

Brisbane, the capital of Queensland, a sea-port and chief seat of trade in the state, is situated about 500 miles N. of Sydney, in Moreton district. It stands about 20 miles by water from the mouth of a river of its own name, which falls into Moreton Bay, and it is divided into the four divisions of North Brisbane, South Brisbane, Kangaroo Point, and Fortitude Valley. Pop. (1876) 26,911; (1881) 31,109; (1901) 54,315, or within a five-mile radius 119,428; (1921) 85,837, or with suburbs 200,000. The iron bridge (1022 feet long) connecting North and South Brisbane took the place of that destroyed by the flood of 1893, which laid half of South Brisbane in ruins. Brisbane possesses broad and handsome streets and some fine buildings, among the chief of which are the Houses of Legislature, which cost £125,000, and the new Government Buildings. Other buildings of importance are the post and tele-

graph office, town-hall, custom-house, Queensland club, museum, and the former Government House, later used to accommodate the university of Queensland. Brisbane is the seat of an Anglican and of a Roman Catholic bishop. There are some forty churches, the chief being the two cathedrals; and several daily and weekly newspapers are published. There are four parks and well-laid-out botanic gardens. Brisbane is very well lighted, and supplied with water from several inexhaustible sources. It is the fourth port in the Commonwealth. Regular steam communication is kept up with the other Australian ports, as well as with London (11,295 miles), and there is an extensive system of wharfs on both sides of the river. The channel of the river has been deepened, and the approach through Moreton Bay straightened, providing a channel 400 feet wide, with a minimum depth of 24 feet at low water. South Brisbane, on the south side of the Brisbane River, is a favourite place of residence, has good wharfs, and a spacious dry-dock, opened in 1881. Brisbane is the terminus of railways to the southern border and Sydney, to Cunnamulla in the far west, and (*via* Rockhampton) to Longreach in Central Queensland. A scheme is now in progress whereby through connection will be given to Cairns, 1000 miles north. The university of Queensland, established in 1909, was opened to students in 1911.

Brisbane was occupied in 1824 by Sir T. Brisbane (q.v.), governor of New South Wales, as a penal settlement for convicts of specially bad character. Shut off from the pastoral country inland (which traded directly with Sydney) by the precipitous Dividing Range, as well as by regulations which forbade free men to come within 60 miles of the settlement, the township grew slowly, and in 1836 comprised the houses of the commandant and other officers, barracks, a tread-mill, stores, &c. In 1842, however, transportation to New South Wales having been abolished, Sir G. Gipps had the town site surveyed and thrown open for sale; but it was not until Queensland became in 1859 a separate colony, with Brisbane as its capital, that the prosperity of the town and district became steady and rapid. The climate on the whole is dry and healthy, with a high summer temperature, the mean temperature in the shade being 70° F. Race-meetings are held at the Ascot racecourse in one of the eastern suburbs. The Brisbane River rises in the Burnett Range, and receives the Bremer and other rivers before its entrance into Moreton Bay, below the town of Brisbane.

Brisbane, GENERAL SIR THOMAS MACKDOUGALL, soldier and astronomer, was born at Brisbane House, Laigs, Ayrshire, July 23, 1773. At the age of sixteen he entered the army, and served with distinction in Flanders, the West Indies, Spain, and North America. In 1821, on Wellington's recommendation, he was appointed governor of New South Wales, a position he held for four years. Towards the end of his term the reforms in penal and land administration which had been recommended by Commissioner Bigge were put into force; the colony received a constitution (1823), a supreme court, and in certain cases trial by jury; and settlers were attracted from England by grants of land proportioned to the live-stock they owned and the convicts they were willing to employ. To provide new jails for other convicts explorations were made along the coast, in the course of which Surveyor-general Oxley discovered the Brisbane River (1823). While in Australia, Brisbane catalogued no less than 7385 stars, and received the Copley medal from the Royal Society. In Scotland, he had an astronomical and a magnetic observatory established at his residence. He was president of the Royal Society of Edinburgh after Sir Walter

Scott. He was made a baronet in 1836, and a G.C.B. in 1837. He died January 27, 1860.

Brissot, JEAN PIERRE, one of the leaders of the French Revolution in its early stage, and afterwards numbered among its victims, was born at Chartres in 1754, and educated for the bar. After completing his studies at Paris, he went into the office of a procurator, but quickly abandoned the legal profession for the more congenial one of authorship. From his earliest years he had devoted himself with passionate eagerness to literary studies, especially history, economy, and politics. His first work, *Théorie des Lois Criminelles* (1780), gained the approbation of the best judges, and was followed by his *Bibliothèque des Lois Criminelles*, which established his reputation as a jurist. He was imprisoned in the Bastille on the false charge of having written a brochure against the queen; but after four months was liberated through the intervention of the Duke of Orleans. His love of freedom again involved him in danger, and to escape from a new term in the Bastille he retired to England. He afterwards visited North America as representative of the *Société des Amis des Noirs*. On the outbreak of the Revolution in 1789 he returned to France, and was elected by the citizens of Paris their representative in the National Assembly, where he exercised a predominant influence over all the early movements of the Revolution. He also established a journal called *Le Patriote Français*, which became the recognised organ of the earliest Republicans. As the Revolution proceeded, Brissot was recognised as the head of the party usually called Girondists (q.v.), from Gironde, the province to which most of them belonged, but also named Brissotins after their leader. Brissot contributed powerfully to the fall of the French monarchy, and strongly enjoined war against Austria and England, and the diffusion of republican principles throughout Europe. In the Convention, his moderation made him suspected as a friend of royalty, as he opposed the 'men of September' and the trial and condemnation of the king. When Louis XVI. heard his doom pronounced, he exclaimed: 'I believed that Brissot would have saved me!' But Brissot was weak enough to imagine that the best way to save the king would be to vote first for his death, and then appeal to the nation. Brissot and his party, perhaps the purest in principle and the weakest in action, ultimately fell before the fierce accusations of the Mountain or Jacobin party, which believed, or at least pretended to believe, that the virtuous Brissot had received money from the court to employ against the Revolution. With twenty other Girondists, Brissot was guillotined, October 31, 1793. See his *Memoirs (Legs à mes Enfants*, ed. by Lescure, 1885), and a study by E. Ellery (1916).

Bristle-fern (*Trichomanes radicans*), one of the Filmy Ferns (q.v.) found in Ireland and rarely in Britain, so called from the bristle projecting from its indusium on the leaf-margin.

Bristles, the strong hairs growing on the back of the hog and wild-boar, and extensively used in the manufacture of Brushes (q.v.), and also by shoemakers and saddlers. They form an important article of British import, and are obtained chiefly from Russia and Germany, but also from France, Belgium, Denmark, Holland, the United States, India, and China. The quality of bristles depends on the length, stiffness, colour, and straightness—white being the most valuable. The best bristles are produced by hogs that inhabit cold countries. The Russian hog is a long, spare animal, and the thinner the hog, the longer and stiffer the bristles. In the summer the hogs are driven in herds through the forests, to feed on soft roots, &c., when, by

rubbing themselves against the trees, they shed their bristles, which are collected and sold.

Bristle-tails. See THYSANURA.

Bristol, a mercantile city 6 miles from the mouth of the Avon, and at its junction with the Frome, is locally partly in Gloucestershire and partly in Somerset, but since 1373 has been itself a county. In 1888 it was made a county borough. Between 1836 and 1904 the city was enlarged four times; in 1885 its parliamentary representation was increased from two to four; in 1918 to five. Since 1899 its chief magistrate has been styled Lord Mayor. The dock undertakings of the corporation are by far its most important enterprise, and shipbuilding and associated trades are great industries. The manufactures are varied, including cocoa, chocolate, leather, boots and shoes, soap, pottery, chemicals, spelter, beer, iron goods, machinery, glass, brass and copper wares, cotton, and sugar (once the staple product). Pop. (1801) 61,153; (1821) 125,148; (1881) 206,503; (1911) 357,048; (1921) 377,061. The ancient town stood wholly on the north of the Avon, on a peninsula formed by that river and the Frome, which then flowed across the bottom of Corn Street; a new course was dug for the Frome in 1248, and this added a large area; and soon afterwards a stone bridge was built across the Avon, connecting the town with Temple-fee, and with Redcliff, which belonged to the lords of Berkeley. After a violent struggle with the House of Berkeley, these districts were included in the town and county by the charter of 1373. The castle, first built probably by Geoffrey, Bishop of Coutances, and rebuilt with a vast keep by Robert, Earl of Gloucester (died 1147), fell into decay, and was demolished in 1654; some remains may be seen in Castle and Tower streets. The cathedral was formerly a church of Augustinian canons (1148); the nave and aisles, pulled down for rebuilding in 15th century, were rebuilt in 1877; the choir is good 14th-century work; a fine Norman chapter-house and gateway remain. Bristol, originally in the diocese of Worcester, was created a see and a city in 1540, with the abbey-church of St Augustine's as cathedral, and was united to the see of Gloucester in 1836; the see was re-erected in 1897. Other noteworthy churches north of the old course of the Avon are St James' (Benedictine), with fine Norman work, and showing the division of the building into parochial and monastic churches; St Philip's and St Jacob's, St Stephen's, All Saints, and the Mayor's Chapel. South of the river is St Mary Redcliff, justly declared by Queen Elizabeth to be the 'fairest and most famous parish church in England.' Of the church rebuilt, 'from the cross aisles downwards,' by William Canynges, sen., merchant (circa 1376), only the south transept and south wall of nave remain; the rest was wrecked by the fall of the spire, and was built by Canynges' grandson and namesake (circa 1470); it is vaulted throughout, and is a magnificent specimen of Perpendicular architecture. The truncated spire was completed in 1872. In the muniment-room is the chest in which Chatterton (1752-70) pretended to have found the Rowley poems. The present Temple Church, on the site of an oval church of the Templars, was built in the 14th century; the tower leans about 5 feet, through a defect in the foundations; attached to the church is the Weavers' Chapel of St Katharine. Among the ancient houses of the town are Canynges' house, Redcliff Street, Spicer's (or Back) Hall, and St Peter's Hospital. The principal educational institutions are the university (1909, formerly University College, 1876, with very fine buildings erected at the expense of Messrs G. A. and H. H. Wills); Clifton College (1862); the grammar-school (1531);

the Merchant Venturers' Technical School; and the charitable foundations, Queen Elizabeth's Hospital (1586), the Red Maids' School (1621), and Colston's School (1704), now in Stapleton. The City Library (free) dates from 1613. Bristol first appears in history on a coin *circa* 1000. The town, which derived its early wealth from exporting slaves to Ireland, took a large part in the war of Stephen's reign, and was besieged by the king. The first charter was granted by Henry II., who also (1171) gave Dublin to the men of Bristol. By 1217 the town had a mayor. In the reign of Edward II. the burghers made an insurrection, stood a siege, and were not brought to obedience for nearly four years. The town did a large trade in wool, leather, wine, and salt, was famous for its cloths, and was one of the 'staple' towns (1353). In the next century its trade was in the hands of great merchants, many of them, like Canynges, men of princely liberality, and generally on the Yorkist side. Bristol took a prominent part in discovery and colonisation. In 1497 John Cabot sailed from the port, and was the first to discover North America; his son Sebastian was probably born in Bristol, and sailed with his father on this voyage. Bristol men colonised Newfoundland, engaged in several early attempts to colonise Maine, and established a large trade with the West Indies and American colonies. The city was taken by Prince Rupert in 1643, and by Fairfax in 1645. Colston the philanthropist (1636-1721) founded many charities, and his 'day' is annually kept in Bristol. In the 18th century privateering was largely carried on, and was encouraged by the success of Captain Woodes Rogers in 1708-10. Other famous names connected with Bristol and Clifton by birth and residence are those of Grocyn, Wixall, Cottle, Sir T. Lawrence, T. L. Beddoes. Southey (1774-1843) was a native of Bristol, and he and Coleridge were much there in their younger days. Burke was returned for the city in 1774, and declined the poll in 1780. One of his chief supporters was Champion (1743-1791), maker of the famous Bristol china; true Bristol china is the product of 1773-81 only. The Reform riots of 1831 occasioned great loss of life and property. The first steam-ship for the transatlantic voyage, the *Great Western*, was built in the port in 1838. Strenuous efforts have been made to improve the dock accommodation; in 1809 the Avon for about 3 miles was turned into a floating harbour. In 1884 the corporation purchased the large docks at Avonmouth and Portishead, which, with the Royal Edward Dock at Avonmouth, opened in 1908 (one of the best-equipped in the country; extension begun 1924), now count as within the port of Bristol. There is a large trade with America, the West Indies, and other overseas regions. The principal imports are grain, provisions, oils, hides, tallow, sugar, and petroleum; the exports, coal, salt, tin-plates, cotton piece-goods, chemical products, oils, and sundries. The art gallery dates in its present shape from 1905. The Hotwell, noticed by the Bristol chronicler, William Worcester (died *circa* 1491), was a fashionable resort during the later half of the 18th century (see *Humphry Clinker* and *Evelina*); it is now reviving after decay. Clifton, the parish to which it belongs, has thriven. It is mentioned in

Domesday, but has little history till it appears as a 'beautiful village' in 1760; it is now a large and handsome suburb of Bristol, of which it forms part for municipal and parliamentary purposes. It stands above St Vincent's Rocks, which rise majestically from the Avon. The river is spanned 245 feet above high-water by a suspension bridge (1864; see BRIDGE). Clifton is well furnished

The Church of St Mary Redcliff, Bristol.

with places of worship, and has a zoological and botanical garden (1836), fine arts academy (1858), observatory, museum, libraries, and other public buildings. In the neighbourhood are the remains of some Roman camps.

Bristol, (1) a city of Connecticut, 15 miles SSW. of Hartford, with foundries, machine-shops, factories for clocks, brass goods, &c.; pop. 20,000. —(2) A town of Bucks county, Pennsylvania, on the Delaware River, 20 miles NNE. of Philadelphia by rail or river. Here is the terminus of the Delaware Canal from Easton (Pa.), and a line of steamboats also connects the town with Philadelphia. It has a foundry, and manufactures of machinery, flour, felt, worsted, and furniture. Pop. 10,000. —(3) A port of entry and capital of Bristol county, Rhode Island, on Narragansett Bay, 15 miles SSE. of Providence by rail, with shipbuilding and sugar-refining, and manufactures of cotton and rubber goods. Pop. 11,000. —(4) A town of Tennessee and city of Virginia, with a joint population of 15,000 (8000 in Tennessee, 7000 in Virginia), the state boundary running through the principal street. There are iron and lumber industries.

Bristol Bay, an arm of Behring Sea, lying immediately to the north of the peninsula of Alaska, receives the waters of two large lakes, by which communication with the interior is opened up for a considerable distance.

Bristol Channel, an inlet of the Atlantic Ocean, in the south-west of England, between South Wales on the north, and Devon and Somerset shires on the south; or it may be regarded as an extension of the estuary of the river Severn. It is about 80 miles long, and 5 to 43 miles broad; the depth ranging from 5 to 40 fathoms. It is the largest inlet or estuary in Britain, having a very irregular coast-line of 220 miles. The chief rivers

entering it are the Towy, Taff, Usk, Wye, Severn, Avon, Axe, Parret, Taw, and Torridge. The tides rise to a great height—at Portishead, 35½ feet; at the mouth of the Avon, 40 feet; and at Chepstow, 53 feet or more. The rapid flow of the tides meeting the currents of the river produces, in the narrow parts of the channel, and in the mouths of one or two of the rivers which enter it, the phenomenon of the *Bore* (q.v.), the tide advancing like a wall of water sometimes 6 to 9 feet high. The chief bays and harbours are Caermarthen and Swansea Bays, Cardiff Roads, on the north, and Bideford or Barnstaple, Ilfracombe, Minehead, Porlock, and Bridgwater, on the south.

Brisure, in Heraldry, is a variation on the original arms of a family, introduced to distinguish cadets from the head of the family and from each other. See CADENCY, HERALDRY.

Britain. See GREAT BRITAIN, NEW BRITAIN.

Britannia, or **BRITANNIA**, the name applied by Roman writers to the island of Great Britain. According to Rhys, *Britannia* has nothing to do with the Welsh *brith*, 'spotted, tattooed,' from which it is commonly derived; but 'so far as we know, the only Celtic words which can be of the same origin are the Welsh vocables *brethyn*, "cloth," and its congeners; in which case the Britons may have styled themselves 'cloth-clad' in contradistinction to the skin-wearing neolithic nation that preceded them (see CELTS). Following their invasion in 43 A.D., the Romans held Britain for close on four centuries, though the uplands and highlands to the north of the Humber and to the west of the Severn they never really subdued. In the first years of their occupation the country south of the Solway Firth and the mouth of the Tyne formed one Roman province under a consular *legatus* and a procurator. Ptolemy mentions seventeen native tribes as inhabiting this tract. Severus (210 A.D.) divided it into two parts, *Britannia Inferior*, the southern, and *Britannia Superior*, the northern, placing these under separate prefects. In the division of the empire under Diocletian (292 A.D.) Britain was made a diocese in the prefecture of Gaul, and was governed by a vicarius residing at Eboracum (York). It was divided into five provinces, of which the boundaries, though uncertain, are supposed to have been as follows: *Britannia Prima*, England south of the Thames and the Bristol Channel; *Britannia Secunda*, Wales; *Flavia Caesariensis*, the country between the Thames, Severn, Mersey, and Humber; *Maxima Caesariensis*, the rest of England to the Wall of Hadrian (q.v.); and *Valentia*—soon abandoned by the Romans—Scotland south of the Wall of Antoninus (q.v.). While certain districts of Britain were administered by agents of the emperor, more often it was sought (with less success in Britain than in Gaul) to mould to Roman shape existing forms of government. Thus the greater part of Britain was divided up into cantons corresponding to the territories of native tribes, and these were ruled on Roman lines by former tribal chiefs and princes. In the lowland parts of Britain troops were hardly ever seen, but in the highlands of the north and west unruly elements were kept in check by auxiliaries posted locally in *castella*, and by at least three Roman legions—chiefly composed of Gauls, Germans, Iberians, and but few pure Romans—stationed at Eboracum (York), Deva (Chester), and Isca (Caerleon, in South Wales). To facilitate the movement of these troops an elaborate road system, radiating from London, was developed. Of the system, equally important from an economic and from a military point of view, there are still numerous remains. The influence of Roman civilisation in Britain was confined almost solely to the

peaceful areas of the eastern and southern lowlands. There many towns arose, centres of Roman law, and industry, and culture. Fifty-six such towns (*coloniae* and *municipia*) are enumerated by Ptolemy. Of these Eboracum (York) and Verulamium (near St Albans) had the privileges of Roman citizenship. In the rural districts the Roman 'villa' system of land tenure was introduced, and under Roman rule Britain first became a corn-producing country. Over the whole lowland area, town and country, Latin became the common language of the more educated classes of the community. Druidism was the religion of the Britons at the time of their conquest by the Romans, but the latter introduced Christianity and Roman literature into the country, though Christianity was not recognised as the state religion till 324 A.D. There are many remains still extant of the presence of the Romans in Britain, such as camps, roads, ruins of houses, baths, fives, altars, mosaic pavements, painted walls, metallic implements and ornaments, weapons, tools, utensils, pottery, coins, sculptures, bronzes, inscriptions, &c. These remains show that the Romans wished to render their British conquests permanent, and that they had greatly improved the arts of the ancient Britons. In the beginning of the 4th century the skilled artisans and builders of Britain were famous on the Continent. Many of the Roman remains in Britain show that the Romans had introduced into the country the refinements and luxuries of Rome itself. After their departure, however, about 410 A.D., a Celtic revival and an English invasion served very largely to obliterate their influence. See ENGLAND, ROADS, WATLING STREET; Conybeare's *Roman Britain* (1903), Codrington's *Roman Roads* (1903), Haverfield's *Romanization of Roman Britain* (1923) and other works, and Collingwood's *Roman Britain* (1923).

Britannia Metal, an alloy of 90 parts of tin, 8 antimony, and 2 copper, or of 81 tin, 16 antimony, 1 copper, and 2 zinc. At least most of the alloys passing under this name have between 80 and 90 per cent. of tin with varying proportions of antimony and copper. The manufacture was begun at Sheffield by Hancock and Jessop in 1770; it reached Birmingham towards the close of the century, and made gradual progress. At first, the articles were made by stamping with dies, and soldering up into form; this, being a slow operation, rendered the articles expensive. Afterwards, the curious process of *metal-spinning* was introduced; and this, with the subsidiary operation of swaging, rendered a great reduction in price possible. In the spinning process, a thin sheet or piece of Britannia metal is placed upon a wooden model shaped like the article to be made; the model is made to rotate in a lathe; and steel, hardwood, bloodstone, or other tools are employed to press the yielding metal into all the curvatures of the model. Ductility is an essential quality to the attainment of this end with the metal; how complete it is, may be seen in such articles as Britannia metal teapots and dish-covers, the principal forms of which are not given by hammering, stamping, or casting, but by spinning. Besides spinning and swaging, the processes include stamping, soldering, casting, and polishing. Britannia metal forms a good ground or basis for electroplating with silver. Britannia metal spoons and ladles, made by casting, stamping, and burnishing, have been nearly driven out of the market by German silver; but the former metal is more largely used than ever for hot-water jugs, coffee-pots, sugar-basins, soup tureens, gravy-dishes, vegetable and side dishes, dram bottles, drinking-cups, wine-coolers, soap-boxes, liquor-frames, cruet, waiters, trays, &c.; and as a basis for electroplate. Sheffield and Birmingham are

the chief seats of the manufacture. After electroplating came into general use in the decade 1840-50, the trade in Britannia metal wares became double what it was previously.

Britannia Tubular Bridge. See BRIDGE.

Britannicus, or in full, Claudius Tiberius Britannicus Caesar, was the son of the Emperor Claudius (q.v.) and his wife Messalina, and was born 42 A.D. The second wife of Claudius, Agrippina, caused her husband to adopt her son Nero, and treat Britannicus as an imbecile; and Nero, after his accession to the throne, caused his miserable half-brother to be poisoned in 55.

British Association, an association whose object is, by bringing together men eminent in all the several departments of science, to assist the progress of discovery, and to diffuse over the whole country the latest results of scientific research. A prevailing impression that England had fallen behind other countries, both as to the general estimation in which scientific men were held, and the prosecution of science itself, led to its formation. It was thought that an imposing union of men of science with the nobility, gentry, and clergy might tend to revive the philosophic spirit of the country. Such meetings had already taken place in Germany, and probably suggested the idea of this institution. Many leading men of the age took part in its formation, but the honour of being its founder must be ascribed to Sir David Brewster. By his exertions the first meeting of those who were favourable to the design was held at York in the year 1831. At this meeting the constitution of the society was determined, the several sections had their provinces assigned to them, and subjects were proposed on which reports were to be drawn up and read at the ensuing meeting. This took place at Oxford in 1832. The university had cordially welcomed the new association, the papers read gave it a high character, and from this date it may be said to have been in complete and successful operation.

At the close of each meeting, the town at which the meeting shall be held (usually in the United Kingdom, but now and then in the Dominions) is determined two years in advance, and a president appointed. The subscriptions of a continually increasing membership have placed a fund at the society's disposal, which has been expended in the prosecution of science.

The annual meeting takes place about the end of August and lasts more than a week, excursions and social gatherings diversifying the more serious labours of the association. There are similar American, French (1872), and German associations for the advancement of science. See O. J. R. Howarth, *The British Association: a Retrospect, 1891-1921* (1922).

British Museum. The British Museum, an important national institution in London, originated in a bequest of Sir Hans Sloane, in accordance with which his extensive collection of objects of natural history, works of art, books and manuscripts, was offered in 1753 to the government for the sum of £20,000, or two-fifths of its original cost. The offer was accepted; the necessary funds were raised by a lottery; and the collection, with the Royal Library and the Harleian and Cottonian MSS., was arranged in Montagu House, which had been purchased for £10,250. The new institution,

thenceforth called the BRITISH MUSEUM, was opened in 1759. The presentation by George III. of a collection of Egyptian antiquities in 1802, the purchase of the Towneley Marbles in 1805, and of the Elgin in 1816, necessitated the erection of a new wing. Soon afterwards the old house was condemned, and plans were prepared by Sir R. Smirke for new buildings; but none were undertaken till 1823, when the eastern wing of the present building was erected for the reception of the library of George III., which had been acquired by the museum from George IV. The building, a hollow square in the Ionic order of architecture, was not completed till 1852. Its principal front is towards the south, facing Great Russell Street, and presenting an imposing columnar façade, 370 feet in length. On each side of the south front there is a semi-detached block, containing the residences of the director and keepers; they will before long be taken into the museum for storage.

Scarcely had Smirke's plans been carried out, when it was found that the increase of the library, both in books and readers, made fresh building imperative. A plan devised by Mr (afterwards Sir Anthony) Panizzi, the keeper of the department of printed books, was accepted. Parliament voted the first grant for it in 1854, and it was executed in three years, at a total cost of £150,000. The new building was erected in the interior quadrangle, which it almost completely occupies. The reading-room is circular, and contains ample and comfortable accommodation for 458 readers. It is constructed principally of iron, with brick arches between the main ribs. The dome is 106 feet in height, and its diameter 140 feet, being second only to the Pantheon of Rome, and that but by 2½ feet. Equally remarkable has been the saving of space in the fitting up of the library. The shelves are formed of galvanised iron plates, and are supported on malleable-iron standards. The bookcases are all double, being divided by a lattice of ironwork. Thus interior walls are dispensed with. In front of the original bookcases movable or 'sliding' cases (an invention of a member of the staff) are now added as need arises. The building is now being raised by a story; it contains, perhaps, 35 miles of book-shelves, holding 2,000,000 volumes, and potentially many more. In addition to this, the domed reading-room has accommodation for 60,000.

With the rapid increase of the collections, both by donation and purchase, the need of space was soon again felt, and the trustees resolved to erect a building to be devoted entirely to Natural History—that is to say, to the departments of Botany, Zoology, Geology, and Mineralogy—on the site occupied by the International Exhibition of 1862. Parliament voted in the year 1873 £80,000 for this purpose, and the new rooms began to be occupied in 1881. The whole cost of the new museum very nearly reached the sum of £400,000. This building, which stands in the Cromwell Road, South Kensington, was designed by Alfred Waterhouse; it is faced within and without with terra-cotta, and is architecturally greatly inferior to the Bloomsbury building. In 1879 the reversion of a bequest by Mr William White enabled the building at Bloomsbury to be enlarged by the addition of the Mausoleum Room on the west side, and on the east, on ground formerly occupied by the principal librarian's garden, of the 'White Wing,' which included a new MSS. Students' Room; these were opened in 1888. The adjoining land on the east, north, and west sides, extending to the street-front, was acquired in 1894 for further extension, which was begun on the north with the 'King Edward VII. Galleries,' partly provided from a bequest by Mr V. Stuckey

Lean; this wing was designed by Sir J. J. Burnet, and opened in 1914. Since 1905 British provincial newspapers have been stored at a repository at Hendon.

Contents.—At first the contents of the museum were arranged under three departments—Printed Books, Manuscripts, and Objects of Natural History. From time to time the number of the departments has been increased, so that, instead of three, there are now twelve—viz. *Bloomsbury*: Printed Books (with printed Music and Maps), Manuscripts, Oriental Printed Books and MSS., Prints and Drawings (with the sub-department of Oriental Prints and Drawings), Oriental Antiquities, Greek and Roman Antiquities, Coins and Medals, British and Mediæval Antiquities, Ceramics and Ethnography; *South Kensington*: Zoology, Entomology, Botany, Geology, and Mineralogy.

Printed Books.—This, the national library, occupies nearly half the building.

The original bequest of Sir Hans Sloane consisted of 50,000 volumes. In 1757 George II. presented the library of printed books which had been collected by the kings of England since Henry VII., and which included the libraries of Cranmer and Casaubon. He also annexed the important privilege, which the Royal Library acquired in 1709, of being supplied with a copy of every publication entered at Stationers' Hall. Among subsequent additions may be mentioned the Thomason collection of English Civil War pamphlets, presented by George III.; Dr C. Burney's Newspapers; Garrick's collection of old English plays; Dr Bentley's collection of the classics, annotated by his own hand; the Rev. C. M. Cracherode's library of about 4500 volumes, remarkable for their beauty and excellence of condition; Sir J. Banks's collection on natural history; and J. W. Croker's collection of French Revolution pamphlets. The library was nearly doubled in size, and more than doubled in value, in 1823, when parliament acquired from George IV. the splendid library collected by his father. The smaller but even choicer library of Thomas Grenville was bequeathed to the museum in 1846. It consists of 20,240 volumes. Whole libraries are now rarely acquired, as they involve the multiplication of duplicate copies. But in 1910 Mr A. H. Huth bequeathed a small but very valuable selection of 50 printed books and MSS. from his famous library, the selection being left to the trustees. A modern extension of the scope of the library has been made by the bequest in 1891 by Thomas Keay-Tapling, M.P., of his Postage Stamps. By purchases, bequests, and donations, largely owing to the energy of Panizzi, the library has become one of the two finest, and in foreign books far the finest, in the world, containing now nearly 4,000,000 printed volumes. In 1880-90 the annual increase was between 30,000 and 40,000 volumes. Since 1900 the annual additions from all quarters, exclusive of about 350,000 continuations, music, newspapers, &c., average about 30,000. The works acquired under the Copyright Act are much more numerous, and on the average less valuable, than those purchased or those presented.

A catalogue of the printed books, in seven octavo volumes, was published in 1813-19. So great have been the additions to the collection that in 1880 the general MS. catalogue occupied upwards of 2000 volumes folio. The printed catalogue, begun in 1881 under the care of Dr Richard Garnett, required for its completion at the beginning of the 20th century some 50 folio printed volumes; as now interleaved for accessions these (with the catalogues of maps and music) occupy over 1000 volumes. The adoption of printing also facilitated the commencement of a subject-catalogue of all new acquisitions

by Mr G. K. Fortescue, at first privately, now officially kept up to date. Other important catalogues of special classes and collections have since been published.

The right of access to the library is easily obtained. Any person desiring it is 'to apply in writing, addressed "To the Principal Librarian of the British Museum," specifying his description and place of abode, and accompanying his letter with a written recommendation,' when he will receive a ticket, renewable every six months. After the adoption (1880) of electric light in the reading room the number of readers greatly increased; in 1913 they reached the total of 236,643, in 1920 of 147,145. The number of books consulted by these readers was well over 1,500,000. There are also the Newspaper Room, the Map Room, and the North Library, enlarged in 1914 from the Lean bequest, for rare books, &c., part of the last being used as a Journal Room. There are separate catalogues of *Maps* and *Music*. See LIBRARY.

Manuscripts.—The manuscripts are contained in several rooms in the south-east angle of the building. The collection consists of: (1) The Sloane, relating chiefly to medical and natural history subjects. (2) The Cotton, rich in documents referring to the history of Britain, including two of the originals of *Magna Carta*, in registers of English monasteries, and in original letters of royal and illustrious personages. This collection contains the *Lindisfarne Gospels*—a copy of the Latin text, written and illuminated about 700 A.D., with a later interlinear Northumbrian gloss. (3) The Harleian, a collection rich in illuminated MSS., in ancient, civil, and ecclesiastical records, in manuscripts of the classics, among which is one of the earliest known copies of the *Odyssey*, and in early English poetry. (4) The manuscripts of the Ancient Royal Library. These were collected by our kings, from Richard II. to George II.; many of them were obtained from the monasteries at the dissolution. Amongst the most valuable treasures here is the *Codex Alexandrinus*, a manuscript of the Bible written in uncial Greek, before the close of the 5th century. (5) The Lansdowne. This collection comprises the Burghley and Cæsar papers, the manuscripts of Bishop Kennett, and numerous valuable historical documents and state papers. (6) The Hargrave, almost exclusively connected with law. (7) The Burney, of Greek and Latin classics. (8) The King's, being those from King George III.'s library (see above, *Printed Books*). (9) The Howard-Arundel, obtained from the Royal Society. This collection is singularly rich in materials for the history of our own country and language. (10) The Egerton, bequeathed by Francis Lord Egerton in 1838, with a fund (augmented by Charles Lord Farnborough) from which it is continually added to. (11) The Stowe, purchased in 1833. (12) Additional, consisting of all miscellaneous acquisitions from the foundation of the museum. Catalogues of the complete collections have long been in existence, while that of the Egerton and additional manuscripts is continually being increased by fresh volumes. Separate catalogues have also been issued of the collections of Greek and Latin MSS., and of romances. The most important recent addition to the department is the gift by the Earl of Chichester of the Duke of Newcastle's papers in 430 volumes. The department now contains about 60,000 volumes, 76,000 charters and rolls, some 17,000 detached seals and casts of seals, and upwards of 1900 ancient Greek, Coptic, and Latin papyri.

Oriental Printed Books and MSS.—Formed from the departments of Printed Books and MSS. Noteworthy are: the collection of Hebrew Bibles; the Near-Eastern MSS., collected by Claudius

Rich (died 1820) while consul at Baghdad; the Syriac MSS. from Nitria; the Ethiopic MSS. acquired after the Abyssinian expedition of 1867; the Chinese library of Robert Morrison (1846); and the Chinese and other Central Asian MSS. recently collected in Turkestan by Sir M. A. Stein.

Prints and Drawings.—This department is housed in the King Edward VII. Galleries; its exhibition gallery and students' room occupy the top floor. Its foundation was in bequests by Cracherode (1799), and Payne Knight (1824); no purchases were made till about 1840. The collection now contains examples in all English and foreign schools of original drawings, etchings, and engravings, also of prints from pictures by well-known masters. There is also an extensive collection of English and foreign portraits and of satirical prints.

Oriental Prints and Drawings (sub-department of).—Formed in 1913, when the Morrison collection of Japanese and Chinese paintings was presented by Sir W. Gwynne-Evans. A large collection of Japanese drawings and woodcuts was already in the department.

Oriental Antiquities.—The Egyptian monuments in this department date from the late pre-dynastic period (about 4500 B.C.), and come down to the 11th century A.D. The collection comprises the antiquities which fell into the hands of the British army at the capitulation of Alexandria; presents from General Vyse, the Duke of Northumberland, &c. The sculptures are formed of granite and basalt; they represent human and allegorical figures, sometimes of colossal size. There are several beautifully sculptured sarcophagi. The key to the Hieroglyphics (q.v.) was furnished by the celebrated Rosetta Stone (q.v.), which is placed at the south end of the gallery. The smaller Egyptian remains are exhibited in a gallery on the upper floor; they consist of objects relating to religion, as representations of divinities and sacred animals in wood, metal, stone, and porcelain; of objects relating to civil and domestic life, as dress, personal ornaments, household furniture, artistic and writing implements, armour, and weapons of war, &c.; and of objects relating to death and burial, as mummies and coffins, with the scarabæi, amulets, and other ornaments foundwith them.

The Assyrian antiquities mainly consist of sculptures excavated at Nimrud, Khorsabad, and Koyunjik by Layard in 1847–50, and more recently by Rassam and Loftus, under the direction of Sir H. C. Rawlinson. The Nimrud sculptures are the oldest, belonging to a period ranging from 930 to 747 B.C. Those obtained from Khorsabad seem to have been executed under a monarch who reigned about 747–721 B.C., while the collection from Koyunjik belong to the time of Sardanapalus, apparently 721–625 B.C. The monuments consist chiefly of slabs of gypsum, alabaster, and limestone sculptured in low relief, the subjects being the exploits of the king whose palace walls they ornamented.

Other Semitic antiquities are here; also the Hittite remains, with hieroglyphic inscriptions as yet undeciphered, from the site of the ancient Carchemish. Excavation for the museum, suspended there, has been renewed at 'Ur of the Chaldees.'

This department has published not only catalogues and guides, but very many texts of great value; among these may be mentioned the *Egyptian Book of the Dead*, from the *Papyrus of Ani*.

Greek and Roman Antiquities.—This collection occupies a series of rooms extending on both floors from the entrance-hall to the former north-west angle of the museum. The Archaic Room contains remains from ancient cities in Lycia, obtained by Sir C. Fellows in 1842–46; the Ephesus Room,

those of the 'temple of Diana of the Ephesians'; the Elgin Room, Attic sculptures of the 5th century B.C., the greater portion of which were saved from destruction, at a cost of £70,000, by the Earl of Elgin, and purchased from him in 1816 for £35,000. The most important series in this gallery, and the most famous possession of the museum, are the decorations of the Parthenon (q.v.). It contains also sculptures and casts from the Temple of Wingless Victory, the Temple of Theseus, and the Erechtheum, at Athens. In an anteroom is the beautiful Demeter of Cnidos. The Phigaleian Room is named from the Phigaleian frieze; it also contains the 'mourning woman' from Trentham, and a series of Attic sepulchral slabs (stelæ), &c. In the Mausoleum Room are the remains of the famous Mausoleum (q.v.) at Halicarnassus, discovered by Sir C. T. Newton in 1857–59. The Nereid Room contains the sculpture from the 'Nereid' monument at Xanthos in Lycia.

The Græco-Roman sculptures include many from the Towneley collection, such as the well-known Clytie, Venus, and Discobolus, and afford a striking contrast with the true Greek work in the neighbouring rooms. The Hall of Roman Busts contains a fine series of portraits of emperors and others. A basement room is given to Etruscan remains. Of Greek and Roman inscriptions a selection is exhibited.

The collections of smaller remains are on the upper floor. They consist of (1) Greek vases formed from the collections of Sir W. Hamilton, &c., and from excavations on the sites of Greek colonies; the series begins with vases, &c., excavated on sites in Crete by Sir A. Evans, representing the prehistoric Minoan civilisations. (2) A miscellaneous collection of terra-cottas, including the beautiful figurines from Tanagra and other places, mural paintings, and other objects. (3) Bronzes of Greek, Etruscan, and Roman workmanship, consisting of sculptures, and various domestic and other articles, as candelabra, lamps, vases, horse-trappings, armour, &c. (4) The collection of engraved gems and gold ornaments, now, since the addition of the Blacas and Castellani collections, perhaps the richest in the world. (5) Roman mosaic pavements.

Coins and Medals.—The nucleus of the collection was formed by Cotton's and Sloane's and George III.'s cabinets. Among notable sources of later additions have been:—(1) Greek: the Payne Knight bequest (1824), and the Bunbury (1896), Montagu (1896–97), and Weber (1919) sales; (2) Roman: the Cracherode (1799) and Wigan (1864) bequests; (3) English: the Bank of England's collection, presented in 1877; Sir John Evans's, presented by Mr J. Pierpont Morgan, and his early British and Celtic coins, presented in 1919 by Sir A. Evans; this section has also been frequently enriched by the Crown's right to treasure-trove; (4) Oriental: the W. Marsden and the India Office collections, presented in 1834 and 1882, and General Sir Alexander Cunningham's collections, sold on very generous terms in 1888 and 1894. Most valuable for their beauty, as apart from historical interest, are the coins of ancient Greece and the medals and plaquettes of the Italian Renaissance. The department has recently secured adequate space for exhibition in the former Waddesdon Room.

British and Mediæval Antiquities.—This is what remains of the old department of antiquities, which originally included the Egyptian, Assyrian, Greek, and Roman Ceramic and Ethnographical collections, and the coins. It still represents most phases of European culture. Canon William Greenwell presented his British Stone and Bronze Age weapons, &c., excavated by himself, and described in his *British Barrows*; his two later and more general

prehistoric collections were (1) presented by Mr J. Pierpont Morgan, and (2) bequeathed (with the donor's other collections) in 1919 by Dr Alan Sturge. The sections of British and mediæval art have been much enriched by the following great bequests: William Burges's of mediæval art (1881), Octavius Morgan's clocks and watches (1888), Baron Ferdinand Rothschild's Waddesdon collection of works of art, chiefly of the Renaissance (1898), Canon Barwell's Limoges and other enamels (1913). In all sections this and the next department are largely indebted to the gifts and bequest of Sir A. W. Franks, keeper from 1866 to 1896.

Ceramics and Ethnography.—Divided from the British and Mediæval Antiquities in 1921. (a) *Ethnography*: Henry Christy, one of the first to perceive that the prehistoric age is illustrated by the weapons, utensils, &c. of peoples now in the same stage of development, made this section (founded on the Cook and Wallis collections) important by his bequest in 1865. The religious art (other than the great monuments) of many countries is here represented, and that of India should not pass unmentioned. (b) *Ceramics and Glass*: Now housed in the King Edward VII. Galleries; chiefly enriched by Felix Slade's glass (1868), John Henderson's Italian majolica, Oriental wares, &c. (1878), and the Franks gifts and bequest. The Chinese porcelain and the Rhodian and English potteries are specially noteworthy.

Natural History Museum at South Kensington.—In 1856 the trustees united the Natural History departments under Professor Owen. In the spring of 1881 the new building at South Kensington was opened. It houses the following departments:—

Zoology.—This department contains a collection of animals arranged in systematic order, comprising stuffed mammals, birds, reptiles, and fishes. A room is specially devoted to the fauna of Britain. Among the very numerous collections that have enriched the department may be mentioned the Wallace birds from the Eastern Archipelago (1873), the Gould humming-birds, the Walsingham birds and nests, and the Selous African animals and birds' eggs (1919).

Entomology.—Separated from Zoology in 1913. The two departments at the removal in 1881 possessed 1,300,000 specimens; in 1922 they possessed over 6,000,000. The annual addition to the entomological collections is about 150,000. The department did much valuable service during the war of 1914–19 in studying the parasites of man. It also conducts a popular campaign on the same subject.

Botany.—The herbaria of Sir Hans Sloane and of Sir Joseph Banks (bequeathed 1820) are the nucleus of the collection; others have been added from time to time. It contains an extraordinary number of typical specimens—the identical plants from which the original descriptions were taken by Linnæus and other famous botanists.

Geology and Palæontology.—This department is especially rich in the fossils of the secondary formations. Amongst its contents may be mentioned the collections of Dr Mantell, the Tertiary fossils collected by Dr Falconer in India, and the fossil birds from New Zealand. Notable recent additions to the series of fossil remains of man are the Pilt-down and Rhodesian skulls.

Mineralogy.—In the mineral gallery is exhibited a selection of specimens, arranged according to a chemical classification.

The museum has always been governed by a body of trustees, of whom there are three principals, the Lord Chancellor, the Archbishop of Canterbury, and the Speaker of the House of Commons.

The usefulness of the museum must always be gauged by the help it renders to real students. Even the art departments at Bloomsbury aim

rather at preserving for comparison and study representative products of different civilisations, than at the direct education of artists, the latter being the object of the Victoria and Albert Museum. Its officers have conducted many archaeological and scientific explorations, by which the collections have been greatly enriched. Of the vast collections in the Natural History departments only a small selection can be exhibited; and the work of the departments lies rather in the classification and private study of the specimens. In all departments the museum's officers are constantly publishing these studies in specialist journals. Every department has published full and scholarly catalogues as well as popular guides; very few, therefore, have been mentioned here. The primary function of the museum, in fact, is to educate the educators, and public exhibition has been a later development. But much of late years has been done to increase its educational value and popularity with casual visitors. Every article exhibited is clearly labelled. In departments, the bulk of whose treasures cannot be displayed, selections are shown. Exhibitions have also been given in the King's Library in celebration of the tercentenaries of Luther, Wyclif, Milton, the Authorised Version of the Bible, &c. At South Kensington the Central Hall is given up to a general introductory exhibition. Official guides conduct popular lectures through both museums daily.

The expenses of the museum are paid by public grants aided by trust funds. The sum provided by the estimates in some years exceeds £200,000. The normal grant for purchase has for many years been fixed at about £6500 per department. As auction prices have long been increasing, it is now very difficult for the museum to secure acquisitions of the first importance in the open market. But by the vigilance of its officers, aided by private benefactors and occasionally by special grants of public money, valuable additions are made and gaps filled year by year in the various departments. The number of visitors to the museum (exclusive of readers in the library) and to the Natural History Museum amounted together in 1913 to a total of 1,433,410, in 1920 to 1,379,184.

Britomartis, or APHAIA. See DICTYNNA; also ÆGINA.

Briton Ferry, a seaport of South Wales, in Glamorganshire, at the mouth of the river Neath, serves as a port to Neath, $2\frac{1}{2}$ miles distant, with which it was incorporated in 1922; pop. 9000.

Brittany (Fr. *Bretagne*), the great north-western peninsula of France, extending in triangular form into the sea, its base resting on Normandy, Maine, Anjou, and Poitou, its sides washed by the Channel and the Atlantic Ocean. In earlier times it formed, with the name of duchy, one of the provinces of France; now it forms the five departments of Finistère, Côtes-du-Nord, Morbihan, Ile-et-Vilaine, and Loire-Inférieure, with a total area of 13,130 sq. m., and a population (1921) of 2,837,946. Before the Revolution, this district fell into the nine dioceses of Rennes, Dol, Nantes, St Malo, and St Brieuc, Tréguier, Vannes, Quimper, and St Pol-de-Léon; of which the first five made up one of the two popular divisions, the names of which are still in general use: Upper Brittany (*Haute-Bretagne*); the last four, Lower Brittany (*Basse-Bretagne*). Though the height of its mountains nowhere exceeds 1150 feet, their structure gives to the peninsula a wild and savage aspect. Clay-slate forms the centre of the country, and masses of granite rise in the north and the south. The climate is often foggy, and subject to violent storms of wind. Large tracts of land lie uncultivated; but in the well-watered

valleys vegetation is luxuriant. The peculiar shut-in situation and the characteristics of soil and climate in Brittany, seem to have had a powerful effect on the character of its people. The Breton has generally a tinge of melancholy in his disposition; and often conceals, under a dull and indifferent exterior, a lively imagination and strong feelings. He is passionately attached to his country and his customs, and is strongly averse to change. A bold seaman and steady soldier, he is devoted in his loyalty to time-honoured authority in church and state, and is capable of extraordinary devotion and sacrifice of self for his ideal. His piety is profound, although simple and unaffected; his pride, serious and self-respectful, entirely free from that petty peevishness and uneasy watching for small slights which so often belittle the real dignity of the Celtic nature. The manners of the natives might be called rude but for their simplicity. The percentage of illiterate persons in Morbihan is 50; in Loire-Inférieure, Côtes-du-Nord, and Finistère it sinks to 40; in Ille-et-Vilaine it is as low as 30. Thus book-learning, so far as regards French books, has hardly yet reached more than a half of Brittany, and the Bretons would be ignorant and uncivilised indeed but for a quite extraordinary wealth of traditional song and story, that serves effectively all the purposes of a national culture. Perhaps nowhere in the world has folklore reached such a high development, and this not less in quality than in quantity; for no traditional stories come near the Breton folk-tales, no popular poetry the Breton folk-songs. It must not be forgotten that there has long existed a pretty abundant literature, at least in religious subjects, in the Breton language, and that even in our day many natives are capable of reading this who do not read, and need not even speak, French. No part of Europe contains so many megalithic monuments as Brittany. Within the province are more than six hundred *dolmens*, and more than eight hundred isolated *menhirs*, and these, moreover, the grandest examples in the world. The largest, at Locmariaquer in Morbihan, is 67 feet high and no less than 342 tons in weight. *Cromlechs* also are very common, some of rectangular form. The great *alignments* near Carnac, situated within a few miles of each other, are the most celebrated megalithic monuments in the world.

In ancient times, Brittany, under the name of *Armorica*, was the centre of the confederated Armorican tribes, who were of Celtic origin. Later it was known as *Provincia Lugdunensis Tertia*, but it never was more than nominally under Roman sway. Already entirely liberated in the 4th century, it became divided into several allied republican states, which afterwards passed into petty monarchies. The Franks called its turbulent and warlike population *Breton*; the Latin writers, since the 5th century, *Britanni* and *Brittones*; while the country was called *Britannia Cismarina*, also later *Britannia Minor*, to distinguish it from the island of Britannia across the Channel, and to mark the original identity in the populations of the two. Brittany became subject to the Franks in the reign of Charlemagne, and was handed over by Charles the Simple to the Northmen in the 10th century. After fierce struggles the Bretons at length acknowledged the suzerainty of the Norman dukes. Geoffroi, Count of Rennes, was the first to assume the title of Duke of Bretagne, in 992. The duchy of Brittany was incorporated with France in 1532 by Francis I., to whom it had come by marriage; and subsequently it shared in the general fortunes of the kingdom. Its local *parlement* at Rennes was of course merely its supreme court, which but rarely played a political

rôle. At the outbreak of the Revolution all the towns, and even some of the larger communes as well as the coast villages, embraced the new ideas, but the country-people mostly followed the lead of their curés and landlords, and remained intensely loyal to the ancient royal house. Brittany accordingly became the arena of a long and bloody struggle against dominant republicanism, its Chouans almost rivalling the Vendéans in the heroic stubbornness of their opposition to the Revolution; but it must be remembered that the revolt against the new ideas was at no time general as it was in Vendée. It was still smouldering so late as 1832, when there was an outbreak of popular feeling in favour of the elder Bourbons. Brittany has given many great men to France: Abélard, Duguesclin, the Connétable de Richemont, Jacques Cartier, Michel Colomb, Dom Lobineau, Duclos, Surcouf, Broussais, Laënnec, Jules Dupré, Duguay-Trouin, Kératry, Maupertuis, Chateaubriand, Lamennais, Jules Simon, and Renan, not to mention countless seamen and admirals. See Daru, *Histoire de Bretagne* (3 vols. 1826); Le Saint, *La Bretagne Ancienne et Moderne* (2d ed. Limoges, 1879); Loth, *L'émigration Bretonne en Armorique* (1883); Joanne, *Bretagne* (1884); books by Baling-Gould (1900), Menpes (1905), Le Braz (trans. 1906), Mrs Bell (1907), Mrs Gostling (1909), and G. W. Edwards (1911).

Language and Literature.—The Breton (*Brezonek*, *Brezounek*; Fr. *Bas Breton*), the ancient language of Brittany, still called sometimes *Armorican*, to distinguish it from insular Breton, is one of those small Celtic tongues which have continued to be spoken languages down to the present time. It forms, together with Welsh in Wales, the but recently extinct Cornish in Cornwall, and that language known from a number of inscriptions to have been the tongue spoken by the ancient Gauls, the Cymric or southern group of the Celtic languages, in which (as in some Italic dialects) Indo-Germanic *gv* became *p*. It is at the present day spoken chiefly in the department of Finistère and the western parts of Côtes-du-Nord, and in Morbihan, and was still, according to the careful calculations of M. Paul Sébillot (in *La Revue d'Ethnographie* for January 1886), the ordinary language of about 1,322,000 persons, of whom no fewer than 679,700 knew that language alone. The paper referred to contains maps showing village by village the limits of Breton and French. By the close of the century there were about 500,000 persons ignorant of French, Breton remaining the 'vernacula lingua' of almost all the actual Breton country. Breton has four dialects: that of Vannes (*Vannetais*), of Quimper (*Cor nouaillais*), of Tréguier (*Trécorrois* or *Tréguois*), and of St Pol-de-Léon (*Léonais*), of which the last is the most important. The dialect of Léon is the purest of the four, although the narrowest in its geographical extent; while the Cornouaillais is the widest, and next to it the Vannetais. These dialects indeed follow very nearly the limits of the ancient dioceses. Breton is most closely allied to Cornish and next to Welsh, but it surpasses both these tongues in the refinement of its grammatical forms and words. Most competent scholars consider it as having been carried across the Channel from England in the settlement made in the 6th century. See Rhys, *Lectures on Welsh Philology* (2d ed. 1879), and Belloguet, *Ethnogenie Gauloise* (4 vols. 1858-75). The greatest service to the grammar and lexicography of the language has been done by Pater Gregoire of Rostrenen, Le Pelletier, and especially Le Gonidec (died 1838). The last wrote the best grammar (Paris, 1807; 3d ed. 1850), as well as an excellent lexicon (Angoulême, 1821; St Brienc, 2 vols. 1847-50). Many valuable papers on questions of Breton philology have been

contributed to the *Revue Celtique*, which was commenced by H. Gaidoz at Paris in 1870, by Gaidoz, Ad. Pictet, Dr Stokes, Sir John Rhys, D'Arbois de Jubainville, Le Men, Sauvé, Luzel, and other scholars. Breton philology was brilliantly advanced by two scholars, Bretons both by birth and tongue: M. Loth and M. Ernault. At the instigation of M. Loth, and mainly under his editorship, the Faculté des Lettres at Rennes has published since 1885 a review, *Les Annales de Bretagne*, devoted in great part to Breton philology. See also Whitley Stokes, *Middle Breton Hours*, with translation and glossary (Calcutta, 1876), and his *Old Breton Glosses* (Calcutta, 1879 and 1880; reprinted by the Philological Society, 1886); J. Loth, *Chrestomathie Bretonne* (1890); dictionaries by Loth and by Ernault; and the *Zeitschrift für Celtische Philologie*.

The Breton literature of the earliest period (since the 6th century) is grouped together with the Bardic literature of the British Isles. Many of the oldest and most famous of the bards (as Gwezou, Taliesin, Sulio) belonged perhaps to Brittany, and their strong and spiced poetry, partly of a patriotic and historical, partly an erotic character, may have had no small influence on the work of the French trouvères of the succeeding centuries. We need only allude to the Arthurian cycle of legend, worked up with such poetic wealth and variety of form by the mediæval poets. The chief monuments of old Breton are two miracle-plays, a prayer-book or 'Hours,' a dictionary, and the cartularies of two monasteries. Of the plays, the first is founded on the life of St Nonna or Nonita, and exists in a manuscript ascribed by Zeuss to the 14th century. It was chiefly from this source, together with the two cartularies of the monasteries at Rhedon and Landevin, alluded to above, that Zeuss drew the materials for the Armorican part of his famous *Grammatica Celtica*. It was published in 1837 under the title of *Buhez Santez Nonn*, but a much better edition was given by M. Ernault in vol. viii. of the *Revue Celtique*. The second play, the *Burzud braz Jezuz*, the great miracle or mystery of Jesus, was edited by Hensart de la Villemarqué in 1865, with a translation. It should, however, be added that this mystery has since been shown to be a translation from the French. As in course of time the French speech and culture spread over the country, and became the more familiar form for literary expression, the Breton struck root all the deeper into the affections of the common people, by becoming the chosen medium alone for the expression of their homely proverb, song, and story. Although it gradually ceased to be used for formal literary composition, Breton continued for centuries to be the medium through which the manuals of piety supplied by the church reached the faithful. The primitive manner of life preserved the conditions necessary not only for the transmission, but the creation of the folk-tale and the ballad, and genuine examples of these have continued to be produced by the free working of the popular imagination almost down to our own time. The extraordinary wealth of Breton popular literature was first revealed to the world, although under a somewhat fictitious garb, by La Villemarqué. His *Barzaz Breiz* (1839; Englished by Tom Taylor in 1865) professed to be the fruit of many years' collecting in every part of Lower Brittany, but unfortunately it cannot be accepted as a genuine undoctored product of the popular imagination in the proper and scientific sense. It consisted of *gwerziou* (plural of *gwerz*), heroic or mythological ballads, many of which are short, but some have as many as 600 verses; *soniou* (plural of *sonn*, or *son*), love and festive songs; and religious poems; and was accompanied with translations and notes, and the original airs noted

in the sixth edition (1867), some of which had, however, been given already in the first edition. Other volumes of poetry in the Breton language were Luzel's *Bepred Breizad* ('always Breton'), consisting of original verse (Morlaix, 1865), and a fine collection under his editorship of genuine *gwerziou* or popular ballads chiefly in the dialect of Tréguier, *Gwerziou Breiz-Izel* (2 vols. 1874). F. M. Luzel, one of the most intelligent and patriotic representatives of 'Bretagne biétonnante' of recent times, as well as one of the most profoundly learned and scientific folkloists of France, published in 1890 his *Soniou Breiz-Izel*. The legends of Brittany were worked up with fine effect by Emile Souvestre in his *Foyer Breton* (1844), and to their rare literary charm we owe some of the finest passages in the pages of George Sand and Renan. Since the 16th century, as has already been said, the native clergy have used the Breton speech for the composition of religious plays and hymns, as well as sermons and books of edification and instruction. At the present day there still appear almanacs in Breton, some bi-lingual; while at election-times there is a plentiful crop of Breton placards and posters. The weekly journal *Faiz ha Breiz* ('Faith and Brittany'), which had a predominantly religious character, died at Quimper after nineteen years' existence (26th April 1884); but other periodicals have followed, wholly or partly in Breton. The language has now a considerable body of modern literature, largely lyric and dramatic. There waited in Upper Brittany an ample harvest of folklore, no less than song and story, for the most learned and indefatigable of its editors, M. Paul Sébillot, the chief of whose collections are his *Contes Populaires de la Haute-Bretagne* (three series, 1880-82), *Littérature Orale de la Haute-Bretagne* (1881), *Traditions et Superstitions de la Haute-Bretagne* (2 vols. 1882), *Contes de Terre et de Mer, Légendes de la Haute-Bretagne* (1885), and *Coutumes Populaires de la Haute-Bretagne* (1886). And from La Villemarqué's own ground, Lower Brittany, M. Luzel gave the world the rich gleanings of years in *Légendes Chrétiennes de la Basse-Bretagne* (2 vols. 1881) and *Contes Populaires de la Basse-Bretagne* (3 vols. 1887), collections that have a place on the shelves of all folklorists. Loth's *Chrestomathie Bretonne* appeared in 1890. There is also a good collection of Breton proverbs, 'Lavarou-Koz,' by L. F. Sauvé (1878). See Henri Gaidoz on 'La Poésie Bretonne pendant la guerre de 1870-71,' in the *Revue des Deux Mondes* for December 15, 1871; and for other books and papers, the 'Bibliographie des Traditions et de la Littérature Populaire de la Bretagne,' by H. Gaidoz and Paul Sébillot, in vol. v. of the *Revue Celtique*.

Brittle-stars (Ophiuroidea), one of the classes of Echinodermata, including forms not far removed from starfishes (Asteroids), but differing markedly in the more centralised body, more sharply defined arms, and more active habit. Compared more fully with starfishes, the brittle-stars are more muscular and less limy; the arms do not contain digestive cæca from the gut nor reproductive organs, and are supported by an axis of central limy bodies like vertebrae; the tube-feet are smaller, and often of little use in locomotion, which is largely effected by wriggling the arms; the ventral (ambulacral) groove is closed in by limy plates; the alimentary canal is blind—that is, without anus; the entrances to the water-vascular system (madreporic plates) are ventral; and the larval form is quite different. The popular name 'brittle-star' refers to the extreme ease with which the arms break; another common name, 'sand-stars,' refers less happily to their occasional occurrence on the shore; the technical title Ophiuroid describes the snake-like coils of their 'arms.' The commonest British species are

the Common Sand-star (*Ophiura texturata*), the Lesser Sand-star (*O. albida*), and the Common Biittle-star (*Ophiocoma rosula*). Another important genus is Euiyale, to which the Basket-fish or Argus Starfish belongs. See ECHINODERMS, STARFISH.

Britton, JOHN (1771-1857), topographer and antiquary, born near Chippenham, received but a scanty education. At sixteen he went to London, and was in turn cellarman, clerk, and compiler of a song-book. Some contributions to a dramatic miscellany led the publisher to employ him, with a young friend, Brayley, to compile the *Beauties of Wiltshire*; its success led up to the *Beauties of England and Wales* (partly by others). They also prepared the *Beauties of Bedfordshire* in the same manner. Britton afterwards issued a more elaborate work, entitled the *Architectural Antiquities of England*. One of the most important of his publications was *The Cathedral Antiquities of England* (1814-35). Altogether his illustrated works number eighty-seven, besides others of a similar kind which he edited. Britton was amongst the first to combine and popularise antiquarian and topographical description, and by his letter to Joseph Hume in 1840 on the preservation of ancient monuments, he anticipated the Act of 1882. See his *Autobiography* (1850).

Britton, THOMAS (1654?-1714), 'the musical small-coal man,' had over his small-coal shop in Clerkenwell a musical club at which Handel and other distinguished musicians performed. He was also an amateur chemist, student of occult literature, and bibliophil.

Brive-la-Gaillarde, a town in the French department of Corrèze, 55 miles SSE. of Limoges by rail; pop. 15,000.

Brixen, a town of Tyrol (ceded to Italy 1919), on the Brenner Railway, 57 miles SSE. of Munich. It is the seat of a bishop, and has several monasteries and a theological seminary. Pop. 6000.

Brixham, a seaport and urban district of Devonshire, England, on Tor Bay, 25 miles S. of Exeter (3½ by rail). It is an irregular place, sprinkled over three valleys and four hillsides; picturesque, though possessed of no architectural features, and fishy as even few fishing-towns. Great quantities of fresh fish are sent to London, Bath, and Bristol; several vessels are engaged in the foreign and coasting trade; there is a little shipbuilding; and the place is a favourite sea-bathing resort. There are iron-mines, limestone quarries, mineral-paint works, and a bone cave on Windmill Hill, discovered in 1858, which contained bones of the mammoth, rhinoceros, horse, reindeer, hyena, bear, &c., besides paleolithic flint implements (see CAVE). Kent's Cavern (q.v.) is beyond Torquay (q.v.), at the other end of the bay. At Berry Head is a Roman camp. At Brixham William of Orange landed, 4th November 1688. Pop. 8000.

Brixton is a district of London (SW.), in Lambeth borough.

Briza, or QUAKING GRASS. See GRASSES.

Brno. See BRÜNN.

Broach, BAROACH, or BHARUCH, a town of Guzerat, Bombay Presidency, 228 miles N. of Bombay by rail, on the north bank of the Nerbudda, from whose inundations it is protected by a river-wall, 30 to 40 feet high, built of large blocks of stone. Eighteen hundred years ago Broach was one of the chief ports of western India, and its foreign commerce did not absolutely disappear until the end of the 18th century. In the 16th century the Portuguese reported it a town of

weavers, 'who make the finest cloth in the world;' this fame led to the founding of English and Dutch factories here in the following century, and even yet its hand-loom weaving is of importance. Broach was taken by the British in 1772, ceded to Sindhia in 1783, and again stormed by a British force in 1803, since which date it has remained a British possession. It carries on a small coasting trade, the principal exports being raw cotton, grain, and seeds. There is a Hindu hospital for old and sick animals. Broach passed from the Moguls at the death of Aurungzebe to the Mahrattas. Pop. 43,400, including many Parsees and Jains.—The district of Broach, an alluvial plain sloping westwards to the shores of the Gulf of Cambay, has an area of 1453 sq. m. It suffered greatly from the famine of 1899-1900. The black soil of the district is highly fertile. There is a railway bridge of 67 spans over the Nerbudda, with a length of 4122 feet.

Broad Arrow, a government mark, thus, stamped, cut, or otherwise fixed on all solid materials used in his Majesty's ships or dockyards, and on government stores of all kinds, in order to prevent larceny. The origin of the mark is obscure; Walford (*History of Newcastle*, vol. iii. 1884) says it was used in 1598 by the collector of customs in Newcastle as a mark for goods seized. The Act of 1698 enacted that persons in possession of naval stores, or goods of any kind marked with the broad arrow, or other marks therein mentioned, and usually employed in marking naval stores, shall forfeit all such goods and £200, and also pay costs.

Broad-bill. See SHOVELLER.

Broad-bottom Administration, a name derisively applied to Henry Pelham's ministry as rearranged in 1744, as including all parties of weight and influence in the state in a grand coalition, and comprising no less than nine dukes. Thus for a time the Whig party were reunited, and even Tory support secured. The ministry was dissolved in 1754 by the death of Pelham, though several of its original members had seceded long before.

Broad Church. See ENGLAND (CHURCH OF).

Broadhurst, HENRY (1840-1911), born at Littlemore, Oxford, from being a stone-mason became a Labour leader and (1880-92) Liberal M.P. He sat for Leicester in 1894-1906, served on royal commissions, and in 1886 was Under-secretary of State for the Home Department. See his *Autobiography* (1901).

Broad Law, a hill (2734 feet) on the Peebles-Selkirk border.

Broadmoor, in SE. Berkshire, 2 miles from Wellington College Station, is the state asylum (1863) for criminal lunatics.

Broad Peak, a summit of the Karakoram (27,133 feet).

Broads, THE NORFOLK, are a series of inland lakes said to be formed by the widening or 'broadening' out of the rivers. More probably their origin is due to the closing of the ancient estuaries into lagoons, the sand-banks developing into firm land; for even within historic times the river Yare was an estuary of the sea, in which herrings were caught at the time of Domesday. The broads *par excellence* are those up the Bure or North River (which empties itself into the sea at Yarmouth), and its tributaries the Ant and the Thurne. On the Bure leaving the comparatively hilly land north of Wroxham it enters a flat marshy country very little above high-water mark, and right and left of it are the well-known broads of Wroxham, Salhouse, Hoveton, Horning, and Ranworth, all of which can be seen from the main river, and are

approached from it by more or less narrow waterways or cuts. The first (Wroxham) is the largest and deepest, there being sailing-water for large boats all over it; but others are very shallow, and are fast dwindling by natural processes: a fine deposit of mud brought down by the rivers, and the decay of abundant vegetation on the banks. On the Ant there is the fine broad at Barton and another at Sutton; but the latter is fast closing up, and is covered with water-lilies. Up the Thurne there is a very large broad at Hickling, and two others at Martham and Horsey, and these are all of note in the east part of the county, on which it is possible to sail; for the three fine broads of Ormesby, Rollesby, and Filby, though connected and forming a chain, have no practicable outlet to the river. The Yare or Norwich River has no broads on which sailing is possible, but the visitor at Norwich will find those at Surlingham and Rockland well worthy a visit, and very accessible by rail. Near Lowestoft, on the Waveney, is Oulton Broad, but this is near the town, and possesses few of the charms of the other sheets of water named. The broads have grown greatly in favour with holiday-makers. About 1870 it was possible to sail from end to end of the Bure without meeting more than two or three yachts. It would now be hard any fine Saturday in August and September to find a mooring-place by Wroxham Bridge, where perhaps a hundred yachts may be seen at once, the place resembling Henley at a regatta time. The great influx of visitors has destroyed the extreme quiet which was the great charm of the place. Still the strange scenery—the great expanse of the landscape, the rank profusion of vegetation and flowers, and the lofty reed bushes—will always render the spot a pleasant one. The broads provide a large harvest of reeds used for various purposes, and bulrushes for bottoming chairs, &c. Game and fish abound, but are jealously preserved, and though plover, moorhen, and an occasional duck and heion can be shot from the deck of a yacht, the sportsman is liable to heavy fines if he lands on the bank to pick up what he has shot. Still the occasional visitor is not generally interfered with if he leaves the game alone. Fish, and especially pike, perch, bream, and rudd, are very plentiful still; but there are only the rivers and one or two broads free to all, though permission is generally easily obtained. For the coarse fish it is absolutely necessary to ground-bait liberally in order to bring the fish to the spot. The ruins of St Benet's Abbey, of Burgh Castle (Roman), and many interesting churches are within easy reach.

See G. C. Davies, *Norfolk Broads* (1884); W. Rye, *Month on the Norfolk Broads* (1887); Emerson and Goodall, *Life and Landscape on the Norfolk Broads* (1887); P. H. Emerson, *On English Lagoons* (1893), and *Birds, Beasts, and Fishes of the Norfolk Broadland* (1895); A. B. Dodd, *On the Broads* (1896); H. R. de Salis, *Norfolk Waterways* (1900); N. Everitt, *Broadland Sport* (1902); W. A. Dutt, *Norfolk Broads* (1903); O. G. Ready, *Life and Sport on the Norfolk Broads* (1910); and G. A. Stephen, *Books on the Broads: a Bibliography* (1921).

Broadside, the simultaneous discharge of all the guns on one side of a ship of war. The fighting power of a ship used to be estimated by the weight of all the shot and shell that could be fired off at once from one side or half of the ship. Thus, the broadside of the old-fashioned *Duke of Wellington*, 131-gun war-steamer, amounted to 2400 lb. With modern battleships and cruisers the term is inapplicable; see NAVY.—A broadside or broadsheet is also a large page printed on one side only, containing a ballad, proclamation, dying speech, or other popular matter. See CHAP-BOOKS.

Broadstairs, a watering-place and urban

district in Kent, 1½ miles N.E. of Ramsgate. Near it is a noble orphanage, founded by the wife of Archbishop Taft. Dickens was a frequent visitor. Pop. 15,000.

Broadsword, a sword with a broad blade, usually for cutting only, not stabbing. See CLAYMORE.

Broadwood, JOHN (1732–1812), founder, with the Swiss Burkhardt Tschudi, of the great London pianoforte house, was born at Cockburnspath, Berwickshire, and walked up to London to become a cabinet-maker there.—His grandson, HENRY FOWLER BROADWOOD (1811–93), was likewise a great improver of the piano.

Broca, PAUL, a distinguished French surgeon and anthropologist, was born at Sainte-Foy-le-Grande, Gironde, in 1824. After pursuing his medical studies with distinction, he was named professor of Surgical Pathology in the Faculty of Medicine at Paris, and surgeon successively of the four hospitals of Bicêtre, the Salpêtrière, Saint Antoine, and La Pitié. He was also director of the Laboratory of Anthropology in the High School of Paris. Celebrated not only as a surgeon, Broca was regarded as one of the most learned masters of the existing school of anthropology. He founded the Paris Anthropological Society, of which he was secretary till his death, and he was a member of all the leading medical, biological, and anatomical societies of Paris and the Continent. Elected a member of the Academy of Medicine in 1866, he was decorated with the Legion of Honour in 1868. Broca was a voluminous writer, and among his more important works may be cited the following: *Des Anévrismes et de leur Traitement* (1856), *Sur l'Anesthésie Chirurgicale Hypnotique* (1859), *Études sur les Animaux Ressuscités* (1860), *Instructions Générales pour les Recherches Anthropologiques* (1865), *Traité des Tumeurs* (1865), *Caractère Physique de l'Homme Préhistorique* (1868), and *L'Anatomie Comparée de l'Homme et des Primates* (1869). He also collaborated in the production of several important medical and physiological works. In 1878 he presided over an International Congress on Anthropology held in Paris. He died July 9, 1880.

Brocade (Span. *brocado*). This term is applied to a kind of figured silk resembling on the one hand a damask, and on the other a piece of embroidery. To some extent it partakes of the character of both, but a piece of silk, woven on the old hand-loom with a slightly raised pattern somewhat resembling a piece of embroidered work, was called a brocade. The name is now applied to a figured silk with a satin or cord ground in which several colours are used, and in which a coloured thread (or more than one) is put in by a shuttle only travelling a short distance, or just the width of a flower or figure. This part of the pattern is technically said to be 'brocaded in.' A brocade may only be of silk on the face, and the back of some other material. Johnson defined the term as meaning 'a silken stuff variegated with gold or silver, and raised and enriched with flowers and various sorts of figures, originally made by the Chinese.' With the exception of those woven in modern times, brocades are very generally composed in part of gold, silver, or gilt silver threads.

Oriental brocades date from a remote period, but there were probably no European stuffs of this nature earlier than the 13th or 14th century, when they were made in Italy and Spain. In common with damasks, figured tissues, and other varieties of ornamented silks made in past times, Italian and Spanish brocades, dating from the 14th to the 17th century, as well as those of Persia and Asia Minor, extending over a longer period of time, are extremely valuable objects of study for the textile designer and decorative artist. Their richness,

beauty, and variety of pattern are very great. The French brocades of the 18th century, and even some of quite modern date, are also interesting in an artistic sense. Fine examples of all these are to be found in some continental museums. The collection at South Kensington is very rich, and is being made available to persons at a distance by highly finished chromo-lithographs of the best pieces, already partly published under the supervision of the authorities of that institution. Some interesting specimens of these fabrics can also be seen in the museums of Manchester, Edinburgh, and Dublin.

Brocage Bonds, or bonds securing a reward for the promotion of a marriage by influence to be used, are void by the law of England and of Scotland.

Broccoli, a well-known and much-esteemed garden vegetable, one of the many varieties which cultivation has produced of the *Brassica oleracea*, the common kale or cabbage. Broccoli is said to have been originally brought to Italy from Cyprus about the middle of the 16th century. Its name is Italian. It is merely a variety of the Cauliflower (q.v.), with the same general characteristics, but a hardier constitution, which enables it to withstand all but our severest winters. Many improved sub-varieties have been introduced within the past fifteen or twenty years, with greater delicacy of flavour and purity of colour, while the original hardy constitution of the race has remained unimpaired. Some of the varieties are early in coming into use from the time of sowing, and others late, and by a judicious selection and a careful study of the times at which each should be sown, broccoli may be made to span the period when cauliflower ceases, in October or November, till it may again be had in June. The trade in broccoli during winter and spring is very great. All British markets are supplied chiefly from Penzance in the early months of the year, the winter climate there being particularly favourable to its early production. The market-gardeners around Edinburgh are noted for the high excellence of the broccoli they produce in the later spring months, and are able to keep up the supply after that of the southern growers fails, and till the first crops of cauliflower come in. See BRASSICA.

The seeds are sown in the open ground in April and May, thinly, and in rows about six inches apart, so that the plants may not become crowded while they remain in the seed-bed. Deep rich loam is requisite to produce the best quality. The plants are finally planted out in June and July, at distances of from two to three feet apart, according to the vigour and bulk eventually attained by the individual sorts. Frequent stirring with the hoe or the fork between the plants is conducive to vigorous growth. In severe winters it is necessary to protect the plants by some means from frost. The most usual means practised is that of digging the soil away from the northern side of each plant, and laying the latter with an angle towards the north. The overhanging leaves prevent the lodgment of rain and snow in the hearts, and offer some protection also against frost, but the size of the heads is usually somewhat diminished by the check administered to the growth. When only small quantities are grown, they may be effectually protected by spreading litter over them when frost is severe, but in the case of large quantities this would prove too laborious and costly. The heads should be cut while they are still quite compact, as otherwise their value is depreciated.

Brochs, the local name applied in the north of Scotland to the ancient, dry-built, circular castles, known also to the Gaelic-speaking people as *duns*,

and to antiquaries (since Pennant's time) as 'Pictish towers,' of which Mousa and Clickemim in Shetland, Dun Dornadilla in Sutherland, Dun Carloway in Lewis, and the two in Glenelg of Glenelg (called Castle Tellve and Castle Troddan by Gordon) are the best-known examples. These circular castles appear to have been more thickly planted along the straths of the northern counties, and around the shores and in the lochs of the northern and western isles, than the later *peels* in the Border valleys. The sites or ruins of more than two hundred are known in the three northern counties. They occur also in very considerable numbers in Ross, Inverness, and Argyll, and a few examples are known in the counties of Perth, Forfar, Stirling, and Berwick. It is only in recent years that the structural characteristics of the brochs and their relation to the other antiquities of the country have been disclosed, chiefly by means of an extensive series of excavations made at the instance of the Society of Antiquaries of Scotland, the details of which, with plans, sections, and measurements of many of these singular edifices, are published in their *Transactions*. The general conclusion is that these structures, which are peculiar to Scotland, belong to a period subsequent to the colonisation of Britain by the Romans, and continued in use, at least in the more northern districts, till after the close of the Viking period of the Northmen, or approximately from about the 6th to about the 12th century. The typical broch, of which Mousa, situated on a small islet near Lerwick, in Shetland, is the best preserved

Broch of Mousa.

example, is a circular tower, built without mortar, the wall 15 feet thick, inclosing a circular area or court 30 feet in diameter. The exterior face of the wall has a slight batter or set inwards; the interior face is perpendicular, but has a ledge or set backwards, at a height of about 8 to 10 feet. There is no opening to the exterior except the door, which is always on the ground-level, and usually about 6 feet in height by about 30 to 36 inches wide. This doorway, or tunnel-like passage, into the interior court through the thickness of the wall, is provided with checks or rebates for a door, with holes in the wall behind them for a long horizontal sliding bar, and these are always placed at some distance within the passage-way, which is further defended by a guard-chamber opening in the thickness of the wall on one or both sides. Round the inside of the court, on the ground-floor, there are, in some cases, doors placed at intervals opening into chambers with beehive roofs, formed in the thick-

ness of the wall. In other cases the wall is solid, except on the left of the main entrance, where there is one opening or doorway, which gives access from the court to a stair in the thickness of the wall leading to the upper stories. Above the first 8 or 10 feet of its height the whole wall is divided, and carried up with a space of about 3 feet between its outer and inner sections, which is traversed horizontally by floors of flagstones at vertical intervals of little more than a man's height. These flagstones are securely bonded into both walls, and each horizontal series passing all round the building forms a floor to the vacant space or gallery above it, and a roof to the gallery below. The stair either crosses all the galleries at one slope, or goes from one to the next by making the floor of each gallery a longer or shorter landing to the next flight of steps. The galleries are

Section of Broch of Mousa.

lighted from the court or inner area of the tower, which is open to the sky. The windows are placed in perpendicular rows, separated from each other only by the thickness of the flagstone which forms the top of one window and the sole of the next above it. No broch being now complete in its upper parts, it is not known what may have been the original height, or the actual number of superposed galleries. Mousa is still 40 feet high, and shows six galleries, and Dun Carloway, which is still 34 feet high, shows five galleries. The brochs vary considerably in size on the ground-plan, the largest known being 70 feet in diameter, and the smallest 40 feet. The average of thirty-one examples is: Exterior diameter, 55½ feet; inner area or court, 28½ feet; thickness of wall, 13½ feet. Many of them have wells within the court, or near the exterior, in which case there is usually a covered way leading to them. Some have drains passing out of the court under the wall. Some are defended by outworks, others completely surrounded by ditch and rampart. In many cases they are placed on promontories cut off from the land by a ditch, or defended by ramparts, while in other cases they are built on islets in lochs, with a causeway of stepping-stones to give access to the islet. At Clickemin there is a gatehouse with guard-chambers at the end of the causeway. But their most remarkable feature is the persistent uniformity of plan and construction which characterises the whole, though with such diversity of detail that no two are exactly alike. Their purpose appears to have been to provide places of secure refuge for the agricultural population, to which they might have recourse with their goods and cattle while the danger of plunder and murder by marauding bands was imminent. The brochs could only be reduced by investment, and as the

marauders' object was to scour the country quickly and get away with their plunder, they could not stay to besiege such strongholds. It is on record that Mousa was once besieged by Harold, Earl of Orkney, about 1155 A.D., but the earl failed to take it, because 'it was difficult to take by assault, and the besieged had made great preparations' to enable them to hold out. The affinities of the typical structure, however, are so distinctively Celtic that none of its essential features have been observed in any construction outside of the Celtic area. The general character of the relics obtained from the systematic excavation of the brochs (of which a collection of some thousands is deposited in the Scottish National Museum) is also clearly Celtic, and of post-Roman times. They show that the occupants cultivated grain, kept flocks and herds, and hunted the forests and fished the seas for their sustenance, that their tools and weapons were swords, spears, daggers, axes, knives, and chisels of iron, and their ornaments, rings, bracelets, pins, and brooches of brass and silver. They made these implements and ornaments themselves, as the moulds, crucibles, and cakes of rough metal found in different brochs testify. Of the bones and horns of animals they made pins, needles, bodkins, buttons, combs, spindle-whorls, and playing-dice, and many other furnishings of everyday life and industry. They made beads and bracelets of jet or lignite, and they had finer beads of variously coloured vitreous pastes, enamelled on the surface with spiral and other patterns. They also made beads and discs of highly polished stone, such as serpentine, marble, and mica-schist. From the commoner varieties of stone they made querns or hand-millstones, mortars, pestles, hammer-stones, whetstones, bowls, cups with handles, lamps, and culinary vessels of various kinds. Their pottery was often fine in shape and finely ornamented. They practised spinning and weaving to a large extent, eighteen weaving-combs and thirty spindle-whorls having been found in a single broch.

See Gordon's *Itinerarium Septentrionale* (1720); Pennant's *Tour in Scotland* (1769-72); Low's *Tour through Orkney and Shetland in 1774* (Kirkwall, 1879); Pococke's *Tours in Scotland, 1747-60* (Scottish History Society, 1887); *Archæologia Scotica*, vol. v.; Erskine Beveridge's *Coll and Tree* (1903), and *North Uist* (1911); *Proc. Soc. Antiq. Scot.*, vols. xxxv., xxxvi., xlviii.; Dr Joseph Anderson's *Scotland in Pagan Times* (1883); and the Reports (1911) of the Royal Commission on the Antiquities of Sutherland, in which county remains of 67 brochs are noted; and of Caithness, which has 145.

Brock, SIR ISAAC (1769-1812), general, born in Guernsey, served in the 8th (King's) Regiment and in the 49th Foot, in which he raised a company. He was rapidly promoted, took part in the North Holland and Baltic operations, and went to Canada in 1802. He commanded in Quebec and (1810) Upper Canada, received the surrender of the Americans at Detroit, and was killed in battle at Queenston. See Life by Lady Edgar (1906).

Brock, SIR THOMAS (1847-1922), sculptor, born at Worcester, studied in London with J. H. Foley and in the Royal Academy School. He was admitted A.R.A. in 1883, R.A. in 1891. Apart from works in galleries, a great many of his public statues and monuments are well known, as the Queen Victoria Memorial at Buckingham Palace, and the Black Prince at Leeds.

Brocken (*Mons Bructerus* of the Romans), popularly known as the *Blockberg*, the highest summit of the Harz Mountains, is situated in Prussian Saxony, 20 miles WSW. of Halberstadt, and 3740 feet above the sea. There pagan worship lingered long after the introduction of Christianity, and there the superstition of the 16th century annually assembled the witches on Walpurgis

Night (see WALPURGA) to hold their revels on its summit. The mountain is also interesting for the 'Spectre of the Brocken' (see MIRAGE).

Brockhaus, FRIEDRICH ARNOLD, the founder of the well-known firm of Brockhaus in Leipzig, and publisher of the *Conversations-Lexikon*, was born at Dortmund, 4th May 1772. In 1802 circumstances led him to Holland, but he returned to Germany in 1810, and in the following year commenced business in Altenburg. Before this, however (in 1808), he had purchased the copyright of the *Conversations-Lexikon*, which had been begun by Löbel in 1796, and was completed in 1811. In 1812 an improved edition began, with Brockhaus as editor. In 1817 his business had so increased that he found it necessary to leave Altenburg for Leipzig, where, in the following year, he added book-printing to publishing. Through all his publishing enterprises, a zealous devotion to the cause of liberty and general enlightenment may be traced. He died 20th August 1823. See his *Life and Letters* (3 vols. 1872-81). The business was afterwards carried on by his sons Friedrich (1800-65) and Heinrich (1804-74); from 1850 by the latter alone; later by Heinrich-Eduard (1829-1914) and Heinrich-Rudolf, his sons, who retired in 1895. Their sons Albert-Eduard (died 1921) and Rudolf-Heinrich had joined the firm; and in 1905 Albert's son Fritz succeeded Rudolf. The *Conversations-Lexikon* has continued to be a conspicuous success; its 14th ed. (for the first time illustrated), in 16 vols., was published in 1892-97; a new edition was begun in 1902. There have been several editions of an abridgment in two or three volumes. Another publication issued by the house (since 1831) is the monumental *Allgemeine Encyclopädie der Wissenschaften und Künste* of Ersch and Gruber, begun in 1818, and still unfinished (168 vols.).

HERMANN BROCKHAUS, third son of F. A. Brockhaus, was born at Amsterdam, 28th January 1806; studied at Leipzig, Göttingen, and Bonn; and lived successively in Copenhagen, Paris, London, and Oxford. From 1848 till his death he held at Leipzig the chair of Sanskrit. His works include editions of the *Fables of Somadeva*, *Kathā Sarit Sāgara* (1839-66); of the Persian version of the 'Seven Wise Masters' (1845); and of the 'Songs of Hafiz' (1854-60). He died at Leipzig, 5th January 1877.

Brockram (signifying 'broken rock') is the local name given to the breccias of Lower Permian age which occur in the north of England, or near Appleby and Kirkby-Stephen. These breccias consist largely of fragments of limestone set in a red sandy matrix, and are occasionally quarried for limestone and building-stone.

Brockton, formerly called North Bridgewater, is a city of Massachusetts, 20 miles S. of Boston. It manufactures boots. Pop. 66,000.

Brockville, a town of Ontario, on the left bank of the St Lawrence, 125 miles SW. of Montreal. It is on the Grand Trunk Railway, and is a port of call for steamers on the St Lawrence. It took its name from Sir Isaac Brock (q.v.). Pop. 10,000.

Brodie, SIR BENJAMIN COLLINS, surgeon, was born at Winterslow Rectory, Wiltshire, in 1783. He studied under Sir Everard Home at St George's Hospital, to which he was in 1808 elected assistant-surgeon, and afterwards surgeon. He had previously lectured both on anatomy and on surgery. In 1810 he was elected a Fellow of the Royal Society, and in 1811 received their Copley medal. In 1834 he was created a baronet, and he held the appointment of serjeant-surgeon to Queen Victoria. He was president of the Royal Society. He wrote on nervous affections, on medical studies,

on psychology, and an *Autobiography*, and died 21st October 1862.—His son, SIR BENJAMIN COLLINS BRODIE (1817-1880), professor of Chemistry at Oxford, discovered graphitic acid.

Brodie, WILLIAM, son of Convener Francis Brodie, was a wright and cabinetmaker, a deacon councillor in Edinburgh. In 1786 he became leader of a gang of burglars, and among other enterprises robbed the Excise Office. One of the gang informed; Brodie was captured at Amsterdam, and hanged (1788). See Stevenson and Henley's play, *Deacon Brodie*, and a book by W. Routhead (1907).

Brody, a town of Eastern Galicia, is situated on a swampy plain, surrounded by forests, 89 miles ENE. of Lemberg by rail. Leather and flax manufactures, brewing, refining, and fur-dressing are carried on. The trade is almost entirely in the hands of the Jews, who form three-fourths of the inhabitants. The town has an historic castle. Pop. 18,000.

Brock, long famed as 'the cleanest place in the world,' is a village 6 miles NE. of Amsterdam, with a great dairy farm.

Brogie, a prominent French family, of Piedmontese origin; its most important members have been the four dukes of the name: (1) FRANÇOIS MARIE, first Duc de, marshal of France, born 1671, took part in every campaign from 1689, and died in 1745.—(2) VICTOR FRANÇOIS, his son, born 1718, was the most capable of the French commanders in the Seven Years' War. Made a marshal in 1759, he entered the Russian service after the Revolution, and died in 1804.—(3) ACHILLE CHARLES LÉONCE VICTOR, grandson of the last, and son of Prince Claude Victor (born 1757, guillotined 1794), born in 1785, was distinguished as a Liberal politician and an earnest advocate for the abolition of slavery. He was foreign secretary (1832-34) and prime-minister (1835-36) under Louis-Philippe; after 1851 he lived in retirement, and died in Paris, 25th January 1870. He was a member of the Academy, and published *Écrits et Discours* (3 vols. 1863), whilst the fourth and last volume of his *Souvenirs* appeared in 1887.—(4) JACQUES VICTOR ALBERT, his eldest son, born 13th June 1821, early entered the field of literature, and was elected an Academician in 1862. Returned as a deputy in 1871, he was till May 1872 ambassador at London; he then became leader of the Conservative right centre, and with a view to force a monarchical government on France, he brought about the resignation of Thiers, and the election of MacMahon, in 1873. He was twice premier (1873-74, 1877), resignation being on both occasions forced on him by Gambetta's exposure of his reactionary tactics. His most important works are his orthodox *L'Eglise et L'Empire Romain au IV^e Siècle* (6 vols. 1856-69), *Le Secret du Roi* (3d ed. 2 vols. 1879), two hostile works on Frederick the Great (1882 and 1884), and the *Mémoires de Talleyrand* (1891). He died 19th January 1901.

Brogue (Irish and Gaelic *brog*), a light shoe formed of one piece of hide or half-tanned leather, gathered round the ankle, which was formerly much in use among the native Irish and the Scottish Highlanders, and of which there were different varieties.—The term brogue is also used to signify the peculiar pronunciation of English that distinguishes natives of Ireland.

Broiling is a convenient and expeditious mode of cooking small pieces of meat, by laying them on a gridiron over a bright fire, or even on the coals themselves. This is perhaps the most primitive mode of preparing meat for eating, as may be supposed from the great ease and simplicity with which the operation is managed. Broiling is, in fact, a quicker sort of roasting. The albumen

of the outside being sealed up at once, the meat is cooked in its own juices and rendered extremely nutritious. But to broil meat so as to preserve its odour, juice, and fat, requires care. The fire should be perfectly clear. Just before setting the gridiron over, some salt should be sprinkled on it to prevent the flare. The gridiron should be perfectly clean, and warmed and greased with suet before using. The meat should never be touched with a fork, but turned rapidly with the broiling tongs.

Broke, SIR PHILIP BOWES VERE (1776-1841), rear-admiral, born at Broke Hall, near Ipswich, entered the service in 1792, was made captain in 1801, and appointed to the *Shannon* frigate, 38 guns, in 1806. In her he fought the memorable duel with the American *Chesapeake* frigate, off Boston, 1st June 1813, which has made 'brave Broke' ever since a hero in popular English song. The Americans were confident of success, but proved no match for Broke's hardy and thoroughly disciplined men, who, after delivering with excellent effect two terrific broadsides, sprang across the gunwale, and, after a moment's struggle, ran up the English colours fifteen minutes after the commencement of the action. A blow received in boarding seriously affected his health, and he retired from active service with a baronetcy. See his *Life* by Dr Brighton (1866).

Broken Hill, originally a ridge of the Barrier Ranges in the west of New South Wales, about 2 miles long. In 1883 a silver lode varying from 10 to 200 feet in width was discovered running along the top, and has since been mined to a depth of 1500 feet below the surface, the outcrop having been removed by an open cut. The rocks forming the range (mainly gneisses, schists, and garnetiferous sandstones) are bent in an anticlinal fold, and the lode (outcrop of limonite containing 2-30 ounces of silver per ton in numerous vugs, succeeded by 'oxidised' ores containing 4-300 ounces and 'sulphide' ores containing 5-36 ounces) occupies a saddle-shaped cavity formed by the contortion of the strata. Large percentages of lead and—in the sulphide ores—of zinc are also obtained. Before 1883 silver-lead deposits had been discovered in the neighbourhood at Thackeringa (1876) and Silvertown (1882), which led to the founding of a town at the latter place in 1883; but it was soon overshadowed by the settlement at Broken Hill itself, which is a city of 26,000 people. The ten principal mines had by the end of 1918 produced over 103 million pounds' worth of silver, and paid about £21,600,000 in dividends and bonuses on a capital not quite £7,500,000. The yield is, however, now more fluctuating than of old, both because the lode is altering as it descends and because of strikes; indeed, after the conclusion of the war production ceased altogether for some years.

Broken Hill, a station in Northern Rhodesia, about 300 miles NE. of Livingstone, with a zinc and lead mine. A cave in the mine, 90 feet below ground-level, has yielded great quantities of bones of animals still found in the district, or their near kin, as well as rude stone and bone implements, similar to those of the Bushmen and Hottentots. To a skull (lacking the lower jaw), with a sacrum, tibia, and the ends of a femur, found in 1921, the name *Homo rhodesiensis* has been given. Notwithstanding his apparently late date the Rhodesian man seems to have been in some respects even more primitive than the Neanderthal race, which the skull, with its huge orbital ridges and palate, suggests.

Broken Knees, an expression indicating that a horse has an abrasion, open wound, or scar on the front of his 'knee,' due to his having fallen or 'come down.' And although it may be quite healed

and only a small mark left, he is still a broken-kneed horse, and his value is seriously affected. He never thoroughly regains his previous action.

If the fall has only caused a superficial wound, the case is a simple one; and unless the skin is much bruised, the hair will grow, and the animal may not be permanently blemished. The sheath, however, through which the tendon over the joint passes, may be opened, and the tendon itself injured, or the joint itself may be opened, and this is indicated by a discharge of the joint-oil or synovia, and by the bones being seen. The worst form of accident is that when the bones of the joint are fractured. The system suffers when the wounds are serious, and severe fever sets in.

In treatment, first cleanse the wound with warm water, and, without probing, ascertain its extent. If it be slight and no joint-oil escape, tie the animal's head to the pillar reins, to keep him from lying down, and from injuring the part by knocking it against the wall or manger. Give opening medicine, bran mashies, and a little hay or grass. Dress the wound daily with antiseptic lotions or with antiseptic lint. If the injury be serious and accompanied by fever, the animal must be at once placed in 'slings,' and in addition to the before-mentioned treatment should receive febrifuges and anodynes. When the bones are broken, he should be destroyed. When the wound is thoroughly healed, the hair may not grow rapidly, nor may the swelling altogether disappear; in this case a mild cantharidine ointment, which should act as an irritant, but not as a blister, may be used. In some cases of severe broken knee, it is advisable to fix the limb so that the animal may not move the joint. In veterinary jurisprudence, a broken knee is regarded as a *blemish*, not as an unsoundness.

Broken Wind is a disease or unsoundness of the horse, termed by some old English writers *pur-siness*. It appears in the form of difficulty in the act of expiration, the horse making an extraordinary or second effort to expel from the lungs the air which has readily entered them during inspiration.

A broken-winded horse is usually an animal that does not thrive, is lean, and has a dependent belly, the muscles of which are unusually active as expiratory muscles. The characteristic symptoms are best observed when the horse is exercised, the breathing becoming very laboured, the nostrils dilated, the eyes bloodshot, and even blue, showing imperfect purification of blood in the lungs. There is a low cough, hardly heard a few yards off, and usually accompanied by the passage of flatus from the anus. When the animal is oppressed by fast work, or dragging a load up a hill, the pulse is excessively rapid, and the heart beats energetically.

Low-bred horses are liable to broken wind, especially if fed on innutritious, dusty, and bulky food, and at the same time kept at hard and fast work. It is due to the irritation in the stomach, caused by indigestible food, being reflected from the nerves of the stomach to those of the lungs—in the same way as, with ourselves, disease in one tooth seems to set all the other teeth aching. This indirect irritation causes firstly spasm, and later on relaxation of the little muscles around the air-tubes; consequently too much air gets into the lungs, and causes pressure on the walls of the air-vesicles, terminating in wasting and rupture of them. The result of this is a lessened area for the aeration of the blood, followed usually by debility and loss of condition. On post-mortem examination we find the stomach much distended with food of a dry nature, and its walls thinned. The lungs are lighter in colour, and float much more buoyantly than in health; little or no blood is seen in them, but they contain a large quantity of air, which makes them crackle when pressed.

The treatment of broken wind is very unsatisfactory; and we can only hope for mitigation of the symptoms by keeping the alimentary canal in proper order, administering occasional purgatives, and feeding on a proper quantity of the best oats, which should always be bruised; also by allowing the horse the best hay in spare quantities—viz. from 10 to 12 lb. daily. We may say that broken wind is incurable; and horses very frequently drop down exhausted when at hard work, and die either from congestion of the lungs, hemorrhage, or simple suffocation.

Broken wind is so bad a form of unsoundness, that horse-dealers sometimes attempt, and even successfully, to hide the defect at the time of the sale, and this they do by causing the animal to swallow *shot* or *grease*. A certain portion of lead weighing in the stomach has a wonderful effect in diminishing the symptoms, which become again obvious enough a few hours after the ruse has been practised on some unwary purchaser.

Broker, an agent employed to make bargains and contracts between other persons, in matters of commerce, for a compensation commonly called brokerage. A broker usually confines his attention to one particular market, as wool, sugar, or iron, and the special knowledge he thus acquires renders his services useful to the general merchant, who has no such intimate acquaintance with the trade. The broker is strictly a middle-man, or intermediate negotiator between the parties, finding buyers or sellers as required. He does not act in his own name, nor has he generally the custody of the goods in which he deals, thus differing from a factor, and he cannot sell publicly like an auctioneer unless licensed as such. He is treated as the agent of both parties, though primarily he is deemed the agent of the party by whom he is originally employed. Besides ordinary commercial brokers, there are several other sorts, such as Stock-brokers (see STOCK-EXCHANGE), Share-brokers, Ship-brokers, Insurance-brokers, and Bill-brokers (see BILL). Persons who deal in old furniture and sell and distrain furniture for rent are also called brokers, although differing entirely in their occupations from the preceding commercial agents. The business of a pawnbroker (see PAWN-BROKING) is also of a different nature.

Brokers in London were formerly admitted by the lord mayor and aldermen, paying £5 on admission, and a like sum annually, under a penalty of £100. They were termed sworn or licensed brokers, and a list was kept by the city of brokers admitted, and of those who had been convicted of fraud or disqualified (33 and 34 Vict. chap. 60). The corporation has ceased to grant licenses or exact fees.

By the Larceny Consolidation Act, 24 and 25 Vict. chap. 96, sect. 76, it is enacted that any person who, being a banker, merchant, broker, attorney, or agent, and being intrusted for safe custody with the property of any other persons, shall in any manner convert or appropriate it to his own use, shall be guilty of a misdemeanour, and be liable to be kept in penal servitude from five to seven years, or to suffer some other punishment, by imprisonment for not more than two years, with hard labour or confinement. See FACTOR.

Brokerage is the remuneration or compensation allowed to a Broker (q.v.).

Bromberg, or BYDGOSZCZ, a town of Polish Posen, on the Brahe, 6 miles from its influx to the Vistula, and 99 miles SSW. of Danzig by rail. It has iron-foundries, machine-shops, and manufactures of cloth and paper, distilleries, breweries, and corn-mills. There is a considerable provincial trade both by shipping and railway. The *Brom-*

berg Canal, 17 miles long, by uniting the rivers Netz and Brahe, connects the Oder and Elbe with the Vistula. Pop. 88,000.

Brome, RICHARD, a minor dramatist, of whose life but little is known save that he was of humble origin, having been in his earlier days servant to Ben Jonson, that he lived in familiar friendship with Dekker, Ford, and Shirley, wrote as many as twenty-four popular plays, was a devout believer, though a hater of Presbyterians and Puritans, and died about 1652. His best plays are *The Northern Lass*, a comedy, written mostly in prose, and *The Jovial Crew*. The revival of the latter in 1819 delighted Charles Lamb, who speaks with enthusiastic warmth of this 'protest in favour of air, and clear liberty, and honest license, and blameless assertion of man's original blest charter of blue skies, and vagrancy, and nothing-to-do.' Other plays are *The Lancashire Witches*, written in collaboration with Heywood, *The Court Beggar*, and *The Queen and Concubine*. Brome was a poor poet, and the lyrics interspersed in the plays are very indifferent verse; some fair lines of his in memory of Fletcher are in the 1647 folio of Beaumont and Fletcher. His plays were reprinted in 1873. See Ward's *Dramatic Literature*, ii. (1875), Swinburne's *Contemporaries of Shakespeare* (1919).

Brome-grass (*Bromus*; Gr. *bromos*, 'a kind of oat'), a genus of grasses, very nearly allied to Fescue (q.v.). The species are numerous, and some of them are very common British grasses—none more so than the Soft Brome (*B. mollis*), an annual or biennial, which has very soft downy leaves, grows well on poor soils, and is readily

Brome-grass.

eaten by cattle, but is not much esteemed by farmers, either for the quantity or quality of fodder which it yields. The seeds of some species are unwholesome. *B. secalinus* (rye brome-grass) is a troublesome weed, especially in rye-fields, whence the legends of the transmutations of rye into brome through supernatural agencies. See GRASSES, and PASTURE.

Bromelia'ceæ, an order of monocotyledonous plants, allied to Amaryllidaceæ and Iridaceæ, and of course to Liliaceæ (q.v.), of which, in the larger sense, many systematists reckon all these mere sub-orders. They most resemble Amaryllidaceæ (with which they are practically continuous through *Agave*), but are usually distinguished by their

perianth-whorls differentiated as calyx and corolla, and by their habit. They are usually short stemmed, with close-set long rigid leaves, often spiny or scaly, channelled and sheathing at the base. The species are all natives of the warmer parts of America, although some of them are now naturalised both in Asia and Africa. The best-known plant of the order, and the only one much valued for its fruit, is the Pine-apple (q.v.). Some species, with their strong spiny leaves, form impenetrable thickets. Many of them are epiphytic, that is to say, grow upon trees without being parasitic, and are often called air-plants. *Tillandsia usneoides*, Beard Moss or Spaniard's Beard of the West Indies and of the southern parts of the United States and Mexico, hangs from the trees like the lichens of colder climates, and gives the foliage of the cypress-groves, where it occurs, a peculiar and melancholy picturesqueness. Many species are known in cultivation, and grown suspended from balconies in South America, or greenhouse roofs in Britain, chiefly on account of their peculiar mode of vegetation, although their flowers are often beautiful and fragrant. Many species are also cultivated as ornamental stove-plants. Species of this order also furnish valuable fibres. *Tillandsia usneoides*, already mentioned, yields a fibre, easily obtained and in great abundance, which is used instead of hair for stuffing mattresses. The fibres of the leaves of the pine-apple, and of some other species of this order, have been made into fabrics resembling the finest white muslin, whilst they are found also to possess sufficient strength for cordage. The produce of different species of *Bromelia* is often included along with that of the American Aloe or *Agave* (q.v.), under the name of *Pita* fibre or *Pita* flax, the appearance and properties of the fibres being very similar, as well as those also of the fibres of the species of *Yucca*. The fibre of the pine-apple is, in some countries, very frequently twisted into fishing-lines, and made into nets and into ropes intended for immersion in water, being very little liable to injury from this cause.—The pine-apple cloth of the Philippines, called *Pina muslin* and *Batiste d'ananas*, also sometimes erroneously called *grass-cloth*, from which it may be distinguished by its untwisted fibres (see *BOHEMERIA*), is obtained from small-fruited varieties of this and allied species—e.g. *Billbergia ovata*.—The fruit of *B. pinguin*, the Wild Ananas of the West Indies, affords a beverage employed in various ailments.

Bromic Acid, HBrO_3 , is the best-known compound of bromine and oxygen. It is prepared pure by acting on bromine, Br , with bromate of silver, AgBrO_3 , when bromide of silver and bromic acid are produced. Bromic acid is a very unstable acid, being readily decomposed by reducing agents. It forms a whole series of salts called Bromates, none of which are of importance. They are mostly crystalline, but their watery solutions readily decompose when evaporated. When heated, they liberate oxygen and form bromides (see *BROMINE*). Mixed with sulphur or charcoal, they explode by percussion, and in this and other properties resemble the chlorates. See *CHLORIC ACID*.

Bromine (Gr. *bromos*, 'disagreeable smell': sym. Br ; atom. wt., 79.96), one of the halogen elements, occurs in combination in sea-water to the extent of about 1 grain to the gallon. It is found in certain saline springs at Kreuznach and Kissingen in Germany, but the chief source is the Stassfurt salt deposits in Germany and in America. It is also present in marine and land plants and animals. In the extraction of bromine from concentrated sea-water, from which common salt has been separated in quantity, and which is then called *Bittern* (q.v.), or from salt springs, the

liquor—which contains the bromine, as bromide of magnesium, MgBr_2 —tickles down a long tower and meets an ascending current of chlorine. Bromine is formed, which is carried over and condensed. It is then purified by redistillation. Electrolytic methods may displace the older methods of manufacture. They depend on the fact that a solution containing both chloride and bromide on having an electric current passed through it has bromine liberated before any chlorine. Under the proper conditions, all the bromine may be liberated. Bromine is a deep red liquid of density 2.98 at 15° C., which readily evolves red fumes of a very irritating and suffocating nature. It is very poisonous, acting by destroying the animal tissues. When even a little of its vapour is inhaled, there is danger of spasm of the glottis and consequent suffocation. It is sparingly soluble in water, more so in alcohol and ether, and its watery solution possesses great bleaching properties. When raised to the temperature of 59° C. it boils, and when reduced to -7° C. it becomes a red crystalline solid. Treated with sulphuretted hydrogen, bromine yields hydrobromic acid, HBr , which is the analogue of hydrochloric acid, as bromine is of chlorine. Bromine is a member of the group called halogens, and is intermediate in its properties between chlorine and iodine; e.g. chlorine is a gas, bromine a liquid, and iodine a solid.

Bromides.—Bromine combines very rapidly with most of the metals, occasionally so as to cause ignition, as in the case of antimony, and forms a class of salts usually known as bromides, though perhaps they are rather hydrobromides (see *HYDROBROMIC ACID*). Bromide of silver, which is very sensitive to the sun's rays, is used in photography. Bromide of potassium, which is the most important of the bromides, may be prepared by the action of bromine on solution of caustic potash. The whole is then evaporated to dryness, and ignited along with charcoal. On solution in water and crystallisation, the bromide is obtained in colourless, cubical crystals, possessing a pungent saline taste, and which are very soluble in water. This salt has been used in a very large number of diseases, owing to its powerful sedative properties. Other bromides (such as those of sodium and ammonium) are of less importance, although they possess similar medicinal properties. Hydrobromic acid combines with these the tonic effects of hydrochloric acid. In epilepsy, bromide of potassium affords marked relief. As a sedative in nervous excitement and sleeplessness, its use produces beneficial results, while in delirium tremens and tetanus large doses give relief. In excessively large doses, general depression, lowering of the temperature, and even death may result. And it should be known and remembered that the administration of bromine compounds in large doses and for long periods often leads to unpleasant effects, collectively termed *bromism*. The earliest and most common are skin eruptions, resembling Acne (q.v.) or boils; the further results are due to diminished activity of the nervous system—viz. lassitude, low spirits, weakened brain power, &c. All these symptoms soon disappear when the use of the drug is discontinued.

Bromley, a municipal and parliamentary borough of Kent, on the Ravensbourne, 10 miles SE. of London. Long the residence of the bishops of Rochester, it has a town-hall (1864) and a college for clergymen's widows (1866). Pop. 35,000; parl. bor. (including Beckenham and Penge) 95,000.

Brompton is a district of London in the borough of Kensington, SW. Part of what was once Brompton is now known as South Kensington.

Brompton, once specially a quarter for artists, contains a fine consumption hospital and the Oratory (q.v.).

Bromsebro, a village and castle of Sweden, 27 miles S. of Kalmar. Treaties were signed here between Sweden and Denmark in 1541, 1641, and 1645.

Bromsgrove, a Worcestershire urban district, near the small river Salwarp, 12 miles NNE. of Worcester, and $1\frac{1}{2}$ mile from a station on the Birmingham and Gloucester Railway. Situated in a richly wooded valley, it has a principal street a mile in length, a grammar-school (1553; re-founded 1693), and a fine old church, restored by Sir Gilbert Scott in 1858, with a spire 189 feet high, and monuments of the Talbots. The linen manufacture has been superseded by nail and button making. Pop. 10,000.

Bromwich. See WEST BROMWICH.

Bronchi are the subdivisions of the trachea or windpipe. Opposite the third dorsal vertebra, the windpipe divides into two branches or bronchi, of similar structure to itself—namely, round and cartilaginous in front; and flat, with muscular and fibrous tissue behind, lined with mucous membrane. Of these bronchi, one goes to each lung, the right being little more than an inch; the left, about two inches in length. On entering the substance of the lung, the bronchi divide into smaller branches, which again subdivide, until they are no larger in diameter than $\frac{1}{16}$ th to $\frac{1}{8}$ th of an inch, and give origin to, or terminate in, small polyhedral sacs, which seem to cluster round their extremities, and open into them. These are the *air-cells*; they consist of elastic tissue, with a lining of mucous membrane, and beneath the latter, a layer of minute blood-vessels of the lung. See RESPIRATION.

Bronchitis, or inflammation of the lining membrane of the bronchial tubes, is a disease of very common occurrence in Great Britain and in the United States, and one of the greatest importance, for, though in most cases completely recovered from, it may, if it becomes chronic, lead to premature and miserable old age, or even in some cases to speedy death. Moreover, besides occurring independently, it is an extremely common complication in other diseases—e.g. in fevers, and in affections of the heart or kidney. It is usually caused by exposure to cold; but persons whose occupations expose them to the constant inhalation of irritating dust (masons, needle-grinders, and many others), often suffer from a form of bronchitis which is extremely apt to lead to disease of the lungs. The first symptoms of acute bronchitis are generally those which distinguish a common cold—viz. shivering, headache, and sense of weariness, with occasional cough; but the cough continues, and recurs in paroxysms; there is a feeling of oppression on the chest and pain behind the breastbone on coughing, and the person *wheezes* when he breathes. He also breathes more rapidly, six or ten respirations in the minute more than he did when in health, his pulse is quicker, and his temperature a little above normal; and the ear applied to his chest, after these symptoms have continued for two or three days, will hear whistling and rattling noises, produced by the passage of the air through parts of the bronchial tubes narrowed by swelling of the mucous membrane and by the excessive amount of mucus which it secretes. This mucus should be dislodged by coughing and spat up. If the inflammation extend no farther than the larger bronchial tubes, it is termed *tubular bronchitis*, and is seldom a fatal disease in the first attack. When the minute ramifications of the bronchial tubes are chiefly or alone affected, either

from the first or by downward extension of the inflammation, this form is called *capillary bronchitis*. It occurs especially among young children and very old people, in whom it forms a very serious and frequently fatal malady. In such a case the cough and associated pain may be less severe, but all the other symptoms—feverishness, distress, prostration, &c.—are much more intense than in the milder form. The breathing may be so embarrassed that the patient can no longer lie down, but requires to sit up, and use all his muscles of respiration. Though he coughs, he spits very little till about the third day, when he spits large quantities of yellow fluid. At last prostration becomes so complete that he ceases to spit, the heart's action becomes greatly embarrassed, and he dies suffocated by the accumulated mucus.

A patient who has once had acute bronchitis is very apt to suffer from it again, and after one or many attacks the disease may become chronic. *Chronic bronchitis* leads to important structural changes in the lungs, especially Emphysema (q.v.), to consequent embarrassment of the respiration and circulation, with secondary changes in other organs, and is generally fatal, though, it may be, not for many years. The patient is always liable to severer attacks, much resembling acute bronchitis, and often induced by very slight causes.

The treatment of bronchitis must vary with the patient's constitution; but in most cases, counter-irritation, applied through the medium of mustard or hot turpentine fomentations, will be found very useful. These remedies act more rapidly than a blister, and may be frequently repeated. It is of the greatest importance that the patient should remain in a warm, equable, and moist atmosphere. In the early stages, before free expectoration is established, ipecacuanha is generally the most useful remedy; but it should be remembered that patients suffering from bronchitis are very easily depressed, especially after the first few days, and then stimulating expectorants, such as ammonia, squills, balsams, should be added. In very acute cases, after a brisk purge, an emetic is often very useful to remove accumulations of mucus. In some cases of bronchitis, the persistence of the disease depends upon some constitutional weakness (gout, syphilis, &c.); and no treatment will effect a cure unless it include remedies for the particular condition which may be present.

In chronic bronchitis, avoidance of the causes which lead to 'catching cold' is of the utmost importance. Residence during the winter in a mild, equable climate, or confinement to a well-warmed house, is sometimes the only measure that will be of much service. The exacerbations must be treated on the same principles as acute bronchitis. In the chronic bronchitis of old persons, the addition of iodide of potassium to soothing remedies is very useful; but opium must be given with great caution, or not at all, as it tends to diminish the expectoration of mucus from inflamed tubes. The paregoric elixir (compound tincture of camphor) is an old and popular remedy in bronchitis, but enough has been said to impress on the reader the danger of tampering with bronchitis. In every case where it is possible, a skilled medical man should be employed, to determine, by the stethoscope, not only the disease but its exact situation and cause; and as it is but too likely to recur at some future period, or symptoms caused by it to appear, a skilled opinion has a permanent value to the patient. See CATARRH.

Bronchocele. See GOITRE.

Brøndsted, PETER OLUF, a Danish archæologist, born near Horsens, in Jutland, 1780, studied at Copenhagen, where in 1813, after some years

spent in travels and excavations in Italy and Greece, he was appointed extraordinary professor of Philology. Returning to Rome in 1818 as agent of the Danish government, he was enabled to carry on his researches for several years. He died rector of the Copenhagen University in 1842. Brondsted's principal work is his *Reisen und Untersuchungen in Griechenland* (Stuttgart, 1826-30), of which only 2 vols. were published.

Brongniart, ALEXANDRE, an eminent French scientist, born at Paris, 1770, became in 1797 professor of Natural History at the Ecole des Quatre Nations, and afterwards in the Museum of Natural History. Appointed in 1800 director of the porcelain manufactory at Sèvres, he held that office for the remainder of his life, and revived the almost lost art of painting on glass. In his *Essai d'une Classification des Reptiles* (1805), he proposed the fourfold division of reptiles into Saurians, Batrachians, Chelonians, and Ophidians. His *Traité Élémentaire de Minéralogie*, published in 1807 at the instance of the Imperial University, became a text-book for lecturers. In 1814 appeared his monograph on Trilobites, a name which, as well as a basis of classification for those singular crustacea, naturalists owe to Brongniart. In 1815 he was elected a member of the Academy, and shortly after made a careful study of the geology of Italy and Switzerland, and of Scandinavia. In 1829 he published the *Tableau des Terrains qui composent l'Ecorce du Globe*, and in 1835 he collaborated with Cuvier in preparing the admirable *Description Géologique et Minéralogique des Environs de Paris*. In 1845 appeared his *Traité des Arts Céramiques*. He died October 7, 1847.—His son, ADOLPHE THÉODORE, was a botanist of some note. He was born in Paris (1801), in 1833 became professor of Botany at the Jardin des Plantes, and in 1852 was made inspector-general of the Scientific Faculties of France. He died in 1876. His principal work is the *Histoire des Végétaux Fossiles* (2 vols. 1828-47).

Broni, a town of Northern Italy, with mineral springs, 11 miles SE. of Pavia. Near by is the castle of Broni, where Prince Eugène obtained a victory over the French in 1703. Pop. 7000.

Bronn, HEINRICH GEORG, a German naturalist, born at Ziegelhausen, 1800, was educated at Heidelberg, where in 1828 he commenced a course of lectures on natural history and palæontology. In 1833 he was nominated professor of Physics, and was afterwards appointed to the zoological lectureship. In 1834 appeared his most important geological work, *Lethæa Geognostica*; in 1841-49 his *Geschichte der Natur*; and in 1850 his *Allgemeine Zoologie*, which was the first attempt to develop zoology in its entirety with reference to extinct organisms. Bronn died 5th July 1862.

Brontë, a town of Sicily, situated at the western base of Mount Etna, 33 miles NW. of Catania. The lava streams of 1661 and 1843 lie on either side, but the district around is fertile, and produces wine. Lord Nelson was created Duke of Bronte by the Neapolitan government in 1799. Pop. 20,000.

Brontë, CHARLOTTE, third child of the Rev. Patrick Brontë (originally Prunty) and Mary Branwell, his wife, was born at Thornton, Bradford, 21st April 1816. Her father was an Irishman of County Down, a man of strong character and some literary talent. His wife, who was a native of Penzance, died of cancer on 15th September 1821, leaving behind her six children. By this time Patrick Brontë had removed to Haworth, where he remained to his death. It was a large village of nearly five thousand inhabitants, most of the people being engaged in the woollen manufacture.

The motherless children were cared for by their aunt, Miss Branwell, and they displayed an extraordinary precocity of talent. Their father treated them as his intellectual equals, and discussed with them the public affairs of the day. They had very little intercourse with their neighbours; their refuge was in the unenclosed, untilled, heathery moors, with their beck and hollows. The two eldest daughters were sent, in July 1824, to a school for clergymen's daughters at Cowan Bridge near Kirkby-Lonsdale, and Charlotte and Emily followed in September. A low fever broke out in the school, and Maria and Elizabeth became seriously ill, and were taken home only to die. Though Charlotte was but eight years old, the habit of observation had set in, and rightly or wrongly she attributed the death of her sisters to cruel treatment at school, an injury avenged in the opening scenes of *Jane Eyre*. At Haworth, where the diminished family now gathered, Miss Branwell gave the girls lessons, and their father told them the news. The three sisters, Charlotte, Emily Jane, and Anne, and their brother, Branwell, devoted themselves to writing, and Charlotte composed in a few years some twenty or thirty tales as well as many poems. In 1831 she went again to school at Roe Head, a country house near Mirfield, and made the friendship of Ellen Nussey and Mary and Martha Taylor. On her letters to Miss Nussey our knowledge of her life is mainly based. Mary and Martha Taylor suggested the Rose and Jessie Yoke of *Shirley*. Returning to her home in 1832, she found that her brother Branwell had contracted vicious habits, and he was to the last a source of increasing misery to the family. She had experiences as a school-teacher, and as a governess at a salary of £20 a year; the discipline of teaching was pronounced 'equally painful and priceless.' The sisters began to think of starting a school, and in February 1842 Charlotte and Emily went to Brussels in order to improve their knowledge of foreign languages. They entered the school kept by M. Héger and his wife in the Rue d'Isabelle.

There can be no doubt that this was a decisive event in Charlotte Brontë's life. M. Héger was a man of accomplishment, enthusiastic and religious in his nature. His pupil regarded him with steadily growing affection and admiration. He recognised her gifts and pitied her loneliness. After spending nine months at Brussels, the Brontë girls returned to Haworth Vicarage on the death of their aunt. Emily remained at home to keep house for her father, but Charlotte returned to Brussels. She wrote to Miss Nussey: 'I returned to Brussels after aunt's death against my conscience, prompted by what then seemed an irresistible impulse. I was punished for my selfish folly by a total withdrawal, for more than two years, of happiness and peace of mind.' During this second period at Brussels she instructed M. Héger and his brother-in-law in English. She suffered much from low spirits, and on one occasion, like Lucy Snowe, paid a visit to the confessional at St Gudule. She says to Emily: 'I actually did confess—a real confession,' a confession which she herself ascribes to caprice. She had no leanings towards Catholicism. By the advice of her friend Mary Taylor she suddenly returned on 18th January 1844. A month after she wrote: 'I suffered much before I left Brussels. I think however long I live I shall not forget what the parting with M. Héger cost me.' She carried on a rather one-sided correspondence with her teacher for eighteen months. Her letters, long believed to be lost, were published in 1913. They express an abject devotion, but its exact nature may be variously interpreted.

She returned to a very gloomy home. Her

brother Branwell, who had become thoroughly vicious—an opium-eater, a drunkard, and a confirmed liar—was dismissed from a situation as tutor, returned to his father's house, and after years of steady deterioration, during which his sisters endured unspeakable agonies, died in September 1848. He was intellectually the weakest of the family. The enforced contact with shameless vice from which the sisters had to suffer left its mark upon their works.

The three sisters put together a little volume of verses, published at their expense, in May 1846. They adopted the pseudonyms Currer, Ellis, and Acton Bell. One or two critics recognised the excellence of Ellis Bell's (Emily Brontë's) work, but it appears that only two copies of the book were sold. Later on Charlotte Brontë reissued the volume, with additional poems from the literary remains of Ellis and Acton Bell. She had written a novel, *The Professor*, based on her Brussels experience, and sent it to various publishers. The manuscript shows that the title originally chosen was *The Master*. It went to six publishers, and was returned without comment; but Mr W. S. Williams, the reader to Messrs Smith, Elder, and Co., saw its value, and Miss Brontë was advised to write a novel of the three-volume size. *The Professor* made only two regulation volumes; otherwise it would probably have been accepted. The book did not appear till after its author's death, and has been unaccountably depreciated by critics; it is, however, an exquisitely fresh and tender love-story, and the heroine, Frances Evans Henri, is perhaps the most charming in Charlotte Brontë's gallery. It gives full proof of the writer's power, and she herself never swerved in her high estimate of its value. It is a story of the love between a master and his pupil, a subject from which her thoughts never moved far. Messrs Smith and Elder couched their refusal of the tale in such reasonable and courteous terms as were almost an encouragement. Miss Brontë replied that she had a second narrative in three volumes now in progress and nearly completed, to which she had endeavoured to impart a more vivid interest than belonged to *The Professor*. It was accepted, printed, and published by 16th October, and in a very short time, and without the aid of the critics, attained a great success. One of its reviewers thus commenced his article: 'Since the publication of *Granville Manor* no novel has created so much sensation as *Jane Eyre*.' The secret of Miss Brontë's triumph is not at all obscure. She combined passion with power of expression. The glow and energy of the story held its readers captive. Very soon there came fierce protests against its unconventionality. The *Quarterly Review* went so far as to suggest that the writer might be a woman 'who for some sufficient reason had long forfeited the society of her sex;' and the *North British Review* followed suit by saying that 'if *Jane Eyre* be the production of a woman, she must be a woman unsexed.' In this, as in all her novels, she describes love not from the man's but from the woman's point of view. It has often been said that Charlotte Brontë's books are autobiographical, and this is true in a very real sense. She drew her characters from life; some of them, she admitted, were merely photographs. But in another sense, equally important, her books do not render the outward part of her own experience. As we know her, Charlotte Brontë was a martyr to her sense of duty. She lived for her family—her father, her sisters, her brother, her servants, and almost denied herself the solace of friendship. But her heroines have no tie to home or family: they are able to choose and shape their destinies. The

second edition of *Jane Eyre*, with a dedication to Thackeray, appeared in January 1848. Thackeray had already expressed his admiration of the book, though he complained that the plot was familiar to him. Miss Brontë said meekly that she had read few novels, and that she imagined the plot was original. Her intense but strictly critical and qualified admiration of Thackeray seems to have been based entirely on *Vanity Fair*.

There was eager speculation on the authorship of *Jane Eyre*. Many critics thought the book must have been written by a man. Others believed that a man and a woman had been at work together, and the names of Barry Cornwall and his wife were suggested. But one critic said: 'We, for our part, cannot doubt that the work is written by a female, and, as certain provincialisms indicate, by one from the north of England.' It is impossible to trace the literary connections of *Jane Eyre*, but it has been suggested that in Charlotte Brontë's conception of love there are distinct traces of Harriet Martineau's forgotten novel, *Deerbrook*. There are also hints of the influence of *Pamela*, which, we know, was read by her father, and imitated by him in a little book. The attempts to suggest foreign origins are not plausible.

Charlotte Brontë, who had kept her secret even from her publishers, went up to London in July 1846 with her sister Anne and revealed herself. Branwell Brontë died, as we have said, in September 1848, Emily in December, and Anne Brontë in May 1849. During this painful time Charlotte was writing *Shirley*, which is the brightest of her stories. Nearly every character in the book was a Yorkshire friend. It was impossible any longer to hide the secret of the authorship. The Yorke family in particular were 'almost daguerreotypes' of the Taylors. Shirley Keeldar, the heroine, represents traces of her sister Emily; Louis Moore, the tutor, is the inevitable M. Héger; Mr Helstone is a Mr Roberson, a fighting Tory parson of the thirties. *Shirley* expressed Charlotte Brontë in her happiest mood, and will always be the favourite novel of many readers, though *Jane Eyre* has been more esteemed by the public and *Villette* by the critics.

Her genius had by this time brought her into a circle of friendly admirers, and among others she came to know Thackeray, G. H. Lewes, Mrs Gaskell, and Miss Martineau. With none of these, however, was she on terms of real intimacy. She was shy and shrinking, melancholy and self-conscious, and her feeble, nervous, suffering body was always sinking to its fall. There could be no greater contrast than that between her fiery soul and her extreme reserve and timidity. Outwardly her life was one of decorous, uneventful simplicity, but as a writer she plunged boldly into the whirl of passion, and never hesitated to lay bare the innermost feelings. Yet her friendships and her fame gave her pleasure. 'How should I be with youth past, sisters lost, a resident in a moorland parish where there is not a single educated family? In that case I should have no world at all: the raven, weary of surveying the deluge and without an ark to return to, would be my type. As it is, something like a hope and motive sustains me still.'

Villette, her last completed story, and artistically the most perfect of all, is a reproduction of her life in Brussels, with touches from more recent experience. It appeared in the beginning of 1853. Her publisher, Mr George Smith, and his mother are among the characters, and it contains a description of Rachel's acting which she had seen in London. The book was received with a burst of acclamation. Harriet Martineau protested against the place it gave to love, and

Anglican journals against its attacks on sacerdotalism. But its picture of love, its romance, its poetry, its sarcasm, and occasional playfulness captivated the world. *Villette* is an autobiography in the fullest sense of the word. Charlotte herself is Lucy Snowe, and M. Héger is Paul Emanuel. Her father urged that the story should end happily with the marriage of the professor and his pupil. The novelist, however, was inflexible. Amidst all the praise the writer's heart was sinking. Her courage was failing; the oppressive quietness of her home-life crushed her spirits. Solitude fearfully aggravated other evils. Her father's curate, Mr A. B. Nicholls (1817-1906), had long courted her. Though Miss Brontë esteemed him, she found him narrow and uncongenial in feelings and tastes. Her father furiously opposed the match; he thought that his famous daughter would be throwing herself away on a curate with £100 a year. Miss Brontë was touched at last by the steadfast devotion of Mr Nicholls, her father yielded, and she was married on 19th June 1854. After a visit with her husband to his Irish relations, she returned to Haworth. Her married life was very happy, but in less than a year her health became precarious; she sank steadily, and died on 31st March 1855. Her last words were: 'Oh, I am not going to die, am I? He will not separate us, we have been so happy.' So ended a deeply shadowed life. Her early friend, Mary Taylor, declared that Mrs Gaskell's biography was 'not so gloomy as the truth,' that Miss Brontë had lived all her days in a walking nightmare of poverty and self-suppression.

EMILY JANE BRONTË was born at Thornton in 1818, and died at Haworth on 19th December 1848, leaving behind her one imperishable novel, *Wuthering Heights*, and some poems which cannot be forgotten. She was an enigma in life; she remains an enigma in death. She went in infancy to the school at Cowan Bridge, and was for some time in 1836 a teacher in a school at Halifax, where she worked from six in the morning till eleven at night. Later on, she was with Charlotte during her first period at Brussels. For the rest, she remained at Haworth, and is said to have been an excellent housekeeper. She had no intimacies except with her sister Anne, and their correspondence has been destroyed. Her two sisters, her father, her brother, her dog, and the old servant in the house were necessary to her, but she never studied their comfort nor returned their confidence. It was said of her that she never showed a regard for any human creature, that all her love was reserved for animals. This is an exaggeration; but her reserve was extreme. She could not live away from the moors, and whenever she was absent she suffered from vehement home-sickness. Miss Nussey tells us that on the top of a moor or in a deep glen she was a child in spirit for glee and enjoyment, that few people had the gift of looking and smiling as she could look and smile. The only man for whom she showed any friendship was a curate, Mr Weightman. She had an exceptional gift for music. Her poems showed remarkable force and vigour, as well as deep feeling. Her creed was never put into explicit form, but it is manifest that she was far from adopting the doctrines of the Church. In December 1847 her novel, *Wuthering Heights*, was published by T. C. Newby, with her sister Anne's story, *Agnes Grey*, the two making three volumes. Newby was a commission publisher of no high character. The sisters paid him £50, and he issued an edition of two hundred and fifty copies. Charlotte Brontë went over it carefully after Emily's death, and editions have been printed with and without her corrections. Emily Brontë did not live long

enough to witness its recognition; she died on 19th December 1848, refusing medical advice, doggedly rejecting sympathy, and clinging passionately to life. The earlier critics of *Wuthering Heights* dwelt on its inhuman characteristics, and it obtained its first recognition from Sydney Dobell in an article published in the *Palladium*. Dobell refused to believe that Ellis Bell and Currer Bell were distinct, and urged Currer Bell to write as she wrote in *Wuthering Heights*. Though he deprecated the employment of the author's wonderful pencil on a picture so destitute of moral beauty and human worth, he declared that *Wuthering Heights* was such an elaboration of a rare and fearful form of mental disease—so terribly strong, so exquisitely subtle—with such niceties in its transitions, such intimate symptomatic truth in its details, as to be at once a psychological and medical study. The book bore everywhere the stamp of high genius, though one looked back at the whole story as to a world of brilliant figures in an atmosphere of mist. Dobell's judgment was confirmed by Matthew Arnold, who wrote of Emily as one

Whose soul
Knew no fellow for might,
Passion, vehemence, grief,
Daring, since Byron died.

Swinburne in a noble panegyric reckons her the greatest genius of the Brontë sisters.

The attempts made by Dr Wright to find the origin of *Wuthering Heights* in Irish stories, and by Mrs Humphry Ward to connect the book with the German romantic movement, have failed. Baseless too is the story that Branwell Brontë had a share in the book. Charlotte Brontë writes after his death: 'My unhappy brother never knew what his sisters had done in literature—he was not aware that they had ever published anything.' Her sisters, she says, wrote from the impulse of nature, the dictates of intuition, and their stores of observation. Emily Brontë remains the sphinx of literature.

ANNE BRONTË would have been forgotten if it had not been for her sisters. Born at Thornton in 1820, she died at Scarborough in May 1849. She had two uncomfortable experiences as a governess; but, with the exception of a visit to London, she only once left her native county. She was in every way more normal than her sisters, gentle, pleasing in appearance, and intellectually commonplace. She was devoutly evangelical, but declined to believe in the doctrine of eternal punishment. The poems were first made completely accessible in 1920. Her two books, *Agnes Grey* and *The Tenant of Wildfell Hall*, have value as throwing light on the Brontë experience; in some of her religious poems she rises above mediocrity. But it is perhaps to be regretted that her novels, especially *The Tenant of Wildfell Hall*, should continue to be reprinted. This was Charlotte Brontë's opinion. Anne had none of the power and fire of her sisters, but was almost as taciturn as they.

See *The Life of Charlotte Brontë*, by Mrs Gaskell (1857); Charlotte Brontë's memoir of her sisters; *A Note on Charlotte Brontë*, by A. C. Swinburne (1877); *Charlotte Brontë, a Monograph*, by Sir Wemyss Reid (1877); Miss Robinson's (Mme. Duclaux's) study on Emily (1883), and Augustine Birrell's on Charlotte (1887); the *Transactions of the Brontë Society*, including a bibliography (1894); Clement K. Shorter, *Charlotte Brontë and her Circle* (1896); expanded later as *The Brontës and their Circle*, *Charlotte Brontë and her Sisters* (1905), and *The Brontës: Life and Letters* (1908); Dimnet, *Les Sœurs Brontë* (1910); May Sinclair, *The Three Brontës* (1912); and A. Law, *Patrick Branwell Brontë* (1924) for the *Wuthering Heights* question. The Haworth Edition of the Works of the three sisters includes Mrs Gaskell's Life, and introductions and notes by Mrs Humphry Ward and Clement Shorter.

BRONX, THE, the northernmost of the five boroughs of New York City (q.v.).

Bronze is defined as an alloy of copper and tin containing more than 50 per cent. of copper. Neither ancient nor modern bronzes consist always of only these two metals. Zinc, lead, and even silver are often present in Greek and Roman bronze objects, although the general result of analysis of these shows a composition of from 80 to 90 parts copper to 10 or 12 of tin. Some of the fine French bronze statues of the time of the Renaissance are made of an alloy of nearly this composition—copper 92, tin 2, zinc 5, lead 1. This would now be called a brass. Much of our modern statuary consists of bronze varying from 10 parts copper and 1 of tin—a proportion recommended by Sir H. Davy—to 8 parts copper and 2 of tin. Some zinc or lead, or both, as well as other metals, are occasionally substituted for part of the tin.

Alloys of copper and tin have been classified in this way: 12 to 20 parts copper with 1 of tin yield red-coloured alloys; 5 to 10 parts copper with 1 of tin yield alloys of strength; 2 to 4 parts copper with 1 of tin yield alloys of sound (bell-metal; see BELL); $\frac{1}{2}$ to 2 parts copper with 1 of tin yield alloys of reflection (speculum metal). The alloys of strength here referred to include the bronze used for statues, and also that, sometimes called gun-metal, employed for bearings and other parts of machinery, as well as the alloys of which cannon are, or perhaps we should rather say were, made. A good deal of the bronze for all three purposes is very similar in composition.

Alloys of copper, tin, and zinc, employed for parts of engines and other machinery, are frequently called brass, as well as gun-metal, and are referred to under the head BRASS; and see ALUMINIUM.

For some engineering purposes bronze is improved by the addition of a little manganese, with or without zinc. A small quantity of silicon gives great tensile strength. It is difficult to make ordinary bronze a quite homogeneous compound. An alloy more perfect in this respect is formed when copper is mixed with tin phosphide instead of metallic tin. The phosphorus, which is added to the extent of from 0.25 to 2.5 per cent., makes the bronze harder, more elastic, and of greater tenacity. This alloy suits best for machinery purposes, for which it is now largely employed, when the proportion of tin is from 7 to 8 per cent. Phosphor-bronze is used for bearings of shafts, piston-rings, pump-rods, propellers, boiler-fittings, and other parts of engineering work. Ornamental castings are also made of it.

History.—An account is given in the next article of the use of bronze in prehistoric times during the Bronze Age. Bronze has been used from early times for statues and statuettes, chiefly representations of deities, as well as for ornamental purposes, in India and China. The brass referred to in the Bible was no doubt bronze (see BRASS). The Egyptians, Greeks, Etruscans, Romans, and other ancient nations employed bronze not only for art objects pure and simple, but for a great number of useful articles, very many of these, however, being artistically decorated. The magnificent collection of bronzes in the National Museum at Naples shows, almost at a glance, how extensive was the use of this alloy for articles of daily and domestic use. It is believed that both the Greeks and Romans, for such objects as swords, spears, saws, razors, and other tools, were able to make an alloy of copper and tin which surpassed modern bronze in some properties, and that they possessed some method of tempering bronze, the secret of which has been lost. The Japanese, who are very clever workers in inlaid metals, make bronze of several colours, such as black, blue, purple, and green. These are

all different mixtures. See BED, LAMP, MIRROR, SCULPTURE, SWORD, and VASE; also BRASS, BRONZING, CAST, FOUNDRY.

Bronze Age, a term in prehistoric archaeology, denoting the condition or stage of culture of a people using bronze as the material for cutting-implements and weapons. As a stage of culture, it comes in between the use of stone and the use of

Fig. 1.—Bronze Axes:

a, flat, 16½ inches in length; b, flanged, 6 inches; c, socketed, 5½ inches.

iron for these purposes. In some regions a Copper Age precedes it. In Europe and Asia the knowledge and use of bronze seems to have spread from Turkestan and Khorasan about four thousand years ago. The bronze age is not an absolute division of time, but a relative condition of culture, which in some areas may have been reached earlier, in others later, while in some it may have been prolonged, and in others brief, or even, as in the Polynesian area, it may have been non-existent in consequence of the people passing directly from the use of stone to that of iron. A bronze-age people in one region may thus have been contemporary with a stone-age people in another, and with an iron-age people in a third; that is to say, the succession of the three ages was not necessarily synchronous, either in contiguous or in widely separated areas. The Homeric poems depict the culture of a people passing from the use of bronze to that of iron. The Mexicans and Peruvians, on the other hand, were still in their bronze age in recent times. The bronze age of Europe generally is marked by the use of certain forms of implements and weapons, as well as by certain conditions of life and customs of burial, which differed from those of the preceding age of stone and of the succeeding age of iron. The implements and weapons of the bronze age include knives, saws, sickles, awls, gouges, hammers, anvils, axes (fig. 1), swords, daggers (fig. 2), spears (fig. 3), arrows, shields (fig. 4). The forms of each class differ in different areas, and vary with advancing time. Blades and axes,

Fig. 2.

a, Bronze sword found in Edinburgh, 20 inches in length; b, Danish bronze dagger, 13 inches in length.

The forms of each class differ in different areas, and vary with advancing time. Blades and axes,

which were at first made with tangs to be inserted in the handles, became socketed for the insertion of the handles; and articles which it was at first the custom to finish in the mould were finished with the hammer, and shields, and vessels made of hammered

Fig. 3.

a, Tanged bronze spear-head, 10½ inches in length; b, socketed bronze spear-head, 19 inches; c, looped bronze spear-head, 9 inches in length; d, Danish battle-axe, 15 inches.

plates riveted together were ornamented with repoussé work. The ornamentation of the bronze age consists chiefly of concentric circles, spirals, and bosses. The workmanship is always of a very high order, the shapes graceful, and the finish fine. The moulds used for casting were of stone, or bronze, or clay. The system of coring was carried

Fig. 4.

Bronze shield (a, front; b, back view), 13½ inches in diameter.

to great perfection, and many of the more difficult castings were turned out in a manner that would do credit to the most expert of modern workmen. The composition of the bronze varied considerably, but may be stated in general as about 90 per cent. of copper to 10 per cent. of tin. The bronze age civilisation of Minoan Crete (q.v.), about 1300 B.C., was splendid beyond anything suspected till the recent excavations at Knossos and elsewhere.

See Evans's *Bronze Implements of Great Britain*; Chantre's *Age du Bronze en France*; Anderson's *Scotland in Pagan Times* (1886); Abercromby, *Bronze Age Pottery* (1912); Keith, *Bronze Age Invaders of Britain* (1915); Peake, *Bronze Age and the Celtic World* (1922); and works named under ARCHAEOLOGY and CRETE.

Bronze-wing, a name given in Australia to certain kinds of wild pigeon, on account of the lustrous bronze colour with which their wings are variously marked.—The Common Bronze-wing or Bronze-winged Ground Dove (*Phaps chalcoptera*) is often seen in flocks, feeds on the ground, and builds its nest chiefly on low branches of trees growing on meadow-lands or near water. It often flies long distances to water, and may be followed

as a guide. It is a plump bird, often weighing fully a pound, and is acceptable at every table.—The Brush Bronze-wing or Little Bronze Pigeon (*P. elegans*) is not so plentiful nor so widely distributed, found chiefly in Tasmania and the southern parts of Australia. It inhabits low swampy grounds, never perches on trees, resembles a partridge in its habits, and makes a loud burring noise like a partridge when it takes wing on being alarmed.—The Harlequin Bronze-wing (*P. histrionica*) is found in the north-western parts of New South Wales in great flocks, feeding on seeds.—Some species of *Ocyphaps* are also sometimes called Bronze-wing. Their partridge-like appearance and habits have gained for them the name of Partridge Pigeon (see PIGEON).

Bronzing. An imitation of bronze may be produced on the surface of other alloys and metals either by corrosive chemical solutions, which is the most efficient way, or by coating them with varnish and bronze powder. In most large towns bronzing-liquor for brass and zinc can be purchased where chemicals are sold. Bronzing is very largely applied to brass-works of various kinds, and especially to gas-fittings. For this purpose the following solutions are used, but the brass is first pickled with nitric acid and scoured with sand and water, or it may be treated with a potash solution.

For dark olive-green bronze, hydrochloric acid and arsenic; sometimes iron scales are added. Afterwards brush with black lead and coat with yellow lacquer. For steel-gray bronze, boiling solution of chloride of arsenic. For brown bronze, solution of the nitrate or perchloride of iron. For black bronze, solution of the chloride of platinum. To produce on new bronze an imitation of the patina on an antique bronze, a mixture in hot water of sal-ammoniac, cream of tartar, common salt, and nitrate of copper is used. Salt of sorrel, sal-ammoniac, and vinegar are another mixture employed.

Iron castings are very effectively bronzed by covering them with an electro deposit of copper in the form of a thin film or layer, which can then be darkened by any of the chemical bronzing solutions, and either lacquered or varnished. The copper surface is often simply varnished. Many beautiful foreign statuettes in zinc are also bronzed in this way. See ELECTRO-METALLURGY.

A brown colour, sometimes called a *bronzing*, is given to the surface of iron and steel objects by a concentrated solution of trichloride of antimony (liquid butter of antimony), having a specific gravity of 1.35; as for gun barrels.

Metal, wood, plaster of Paris, and other materials can be coated with gold or bronze powders in the form of a paint. When bronze powder is used, the wood or plaster first receives three or four coats of yellow oil-paint, then two coats of a mixture of the bronze powder with flat varnish, and finally this is covered with another layer of varnish.

Bronzino, IL, a name given to several Italian painters.—(1) AGNOLO DI COSIMO (1502-72), born at Monticelli, was a pupil of Raffaellino del Garbo and Jacopo da Pontorno, and was influenced by Michelangelo. He is best known for his portraits, including Cosimo I., Eleonora de Toledo, and Ugolino Martelli, and for 'Christ's Descent into Hell.'—(2) ALESSANDRO ALLORI (1535-1607), his nephew and pupil, born in Florence, painted frescoes and altar-pieces.—(3) Alessandro's son and pupil, CRISTOFANO (1577-1621), was also born in Florence. He painted 'Judith with the Head of Holofernes,' portraits, and altar-pieces.

Bronzite, a rock-forming mineral, one of the Pyroxenes (q.v.).

Brooch, an ornamental pin or instrument for fastening the dress, consisting for the most

part either of a ring or disc, or of a semicircle, there being a pin in either case passing across it, fastened at one end with a joint or loop, and at the other with a hook. The oldest known brooches are those found in graves assigned to the early iron age of Southern Europe. They are made of bronze, and consist of a bent or bow-shaped body, with a spring pin coming from a spiral twist at one end, and its point fitting into a loop of the bow at the other end, like the modern 'safety' shawl-pin. They are exceedingly varied in form, often presenting grotesque imitations of the shapes of animals. The form which prevailed in Northern Europe was more massive, having a cross-bar at one end, and covered with chased ornamentation inlaid with gold. In Scandinavia a peculiar form of brooch of brass of oval bowl-shape, covered with dragoesque ornamentation, plated with gold and studded with bosses and coloured pastes, was characteristic of the Viking period. The early Celtic brooches of Scotland and Ireland were penannular, the ring being incomplete, with expanded ends, while the pin, which was loosely looped upon the ring, was greatly longer than the diameter of the brooch. They were made of bronze or silver plated with gold; the flat ring, divided into panels, was richly ornamented with interlaced or spiral patterns, or dragoesque filigree work, peculiar to Celtic art, and studded with settings of amber or coloured glass. The most elaborate work of art of this description is the Tara Brooch, preserved in the museum of the Royal Irish Academy at Dublin, of which a woodcut is subjoined. The finest in

The Tara Brooch.

Scotland is the so-called Hunterston Brooch, which was found in 1830, on the estate of Hunterston, in the parish of West Kilbride, Ayrshire. It is of silver, richly ornamented with gold filigree, elaborately worked into lacertine and ribbon patterns, and set with ornaments of amber; diameter, $4\frac{1}{8}$ inches. On the reverse is an inscription scratched in runes: 'Maelbritha owns this brooch.' The later form of the Highland brooch of brass or silver is annular, having a pin of the length of the diameter of the ring. Those of brass are decorated with chased

patterns of interlaced work, scrolls of foliage, and grotesque animals. Those of silver have their decoration often inlaid with niello, and sometimes enriched with settings. The Ugadale Brooch, in

Brooch of Ugadale.

the possession of Hector Macneal of Ugadale, in Kintyre, which is here figured, is a characteristic example of a form of reliquary brooch of West Highland origin. The Brooch of Lorn, in the possession of Macdougall of Dunolly, near Oban, has the reputation of being identical with one torn from the breast of Robert Bruce by Alexander of Lorn, the ancestor of Macdougall, in a personal contest with the king, but it is also identical in form and character with the Lochbuy Brooch, now in the British Museum, and classed as a work of the 16th century. They are all about $4\frac{1}{2}$ inches in diameter, having a circle of jewelled obelisks rising round a central capsule, crowned by a large rock-crystal. The capsule is removable, and discloses a cavity, designed, doubtless, for the purpose of a reliquary.

Brooke, BARON. See GREVILLE, SIR FULKE.

Brooke, HENRY, born in 1708, at Rantavan, County Cavan, the son of a wealthy clergyman, in 1720 entered Trinity College, Dublin, and in 1724 went to study law in London, where he became the chosen friend of Pope and Lyttelton. From the heart of this brilliant literary society he was recalled to Ireland by a dying aunt, who left him guardian of her child, a girl of twelve, whom he afterwards married. His poem, *Universal Beauty* (1735), is supposed to have supplied the foundation for Erasmus Darwin's *Botanic Garden*. In 1739 he published his play, *Gustavus Vasa*, full of the noblest sentiments and the most inconceivable characters, the acting of which was prohibited at Drury Lane; Dr Johnson writing a satire in vindication of the licensers of the stage. It was afterwards produced in Dublin as the *Patriot*. In 1740 Brooke was taken ill, and returned finally to his native country, where he published several books. He died at Dublin, in a state of mental debility, 10th October 1783. The sonorous eloquence of his plays has not saved them from oblivion; and his novel, *The Fool of Quality*, is the sole survivor of his numerous works. It is distinguished by humour, close observation, simplicity of style, and a religious and philanthropic tone that highly commended it to John Wesley. Kingsley thought that the reader would learn more from it of what was pure, sacred, and eternal, than from any book since the *Faerie Queene*.

Brooke, SIR JAMES, a man strongly imbued with the Elizabethan spirit of adventure, was born at Benares, 29th April 1803, and educated at Norwich. He entered the East India army (1819), was seriously wounded in the Burmese war, and returned

home on furlough (1826). The voyage out to join his regiment was so protracted that he was unable to reach India before his furlough had expired; his appointments consequently lapsed, and he quitted the service in 1830 and returned to England. He now conceived the idea of putting down piracy in the Eastern Archipelago, and of carrying civilisation to the savages. He purchased a small brig and made a voyage to China. On his father's death (1835) he inherited £30,000, and after a cruise in the Mediterranean, sailed in a schooner-yacht from London for Sarawak in 1838. When he arrived there (1839), the uncle of the sultan of Borneo was engaged in a war with some rebel tribes. Brooke lent his assistance, and in return had the title of Raja and Governor of Sarawak conferred upon him, 24th September 1841, the native governor being forced to resign. Brooke immediately set about reforming the government, instituted free trade, and framed a new code of laws. Head-hunting, prevalent among the Dayaks, he made punishable with death, and he vigorously set about the extirpation of piracy. Labuan having been purchased by the British government, he was appointed governor and commander-in-chief, and British commissioner and consul-general in Borneo. Certain charges brought in 1851 against Brooke in the House of Commons in connection with the receipt of 'head-money' for the slain pirates were declared by a Royal Commission to be unsubstantiated; the 'head money' was received, not by Brooke and his associates, but by the British ships-of-war that had co-operated with him. In 1857 Brooke, who had been superseded in the governorship of Labuan, but who still acted as raja of Sarawak for the sultan of Borneo, was attacked at night in his house by a large body of Chinese, who were irritated at his efforts to prevent opium-smuggling. He defeated them in several fights. The independence of Sarawak was recognised by the English government. The country prospered greatly under his régime: he found the chief town a place of some 1000 inhabitants; he left it a town of 25,000. Brooke visited England several times, and died at Burrator, in Devonshire, 11th June 1868. He was succeeded by his sister's son, SIR CHARLES JOHNSTON BROOKE (1823-1917), and he by his son, CHARLES VYNER BROOKE (b. 1874). See SARAWAK; also *Letters of Sir James Brooke* (1853), and books on him by Jacob (1876) and St John (1879, 1899).

Brooke, RUPERT CHAWNER (1887-1915), a poet of great promise, born at Rugby, was educated there and at King's College, Cambridge, of which he became a fellow in 1913. A naval officer in the Dardanelles expedition, he died at sea near Lemnos. His works include *Poems* (1911), *1914* (1915), *Letters from America* (1916), and a dissertation on John Webster (1916). A collected edition of the *Poems* with a memoir appeared in 1918.

Brooke, STOFFORD AUGUSTUS (1832-1916), writer and preacher, was born in Letterkenny, Donegal. After a brilliant course at Trinity College, Dublin, he took orders, and after holding various curacies, was incumbent of St James's Chapel from 1866 to 1875, thereafter of Bedford Chapel, Bloomsbury, where his sermons, at once rich in thought and graceful in literary form, made him one of the chief preachers in London. In 1880, through inability any longer to believe in miracles, he left the Church of England, but preached for a time in a chapel of his own. Brooke showed fine literary sense and spiritual sympathy in his *Life of Robertson of Brighton*, *Theology in the English Poets*, books on Milton, Tennyson, Browning, Shakespeare, naturalism, the famous *Primer* and other

histories of English literature, besides books on Jesus and sermons. See his *Life and Letters* by Jacks (1917).

Brook Farm, a community on Fourier's principles, 8 miles SW. of Boston, organised in 1840 by George Ripley, and largely an outcome of the Transcendental movement. On an estate of 200 acres, a company of scholars and educated men and women settled down to a communistic experiment, in which each should do his share of the necessary manual work. The phalanstery, 175 feet long and three stories high, was burned down before it was occupied; and the attempt ended in hopeless failure. Hawthorne was one of the founders, and lived for some months on the farm, in which he invested all his savings; a charming memorial of the enterprise is his *Bithedale Romance*.

Brookline. See SPEEDWELL.

Brookline, a suburban town, about 4 miles SW. of Boston, U.S., with numerous handsome villas and parks, and manufactories of philosophical instruments, &c.; pop. 38,000.

Brooklyn, till 1898 the capital of King's County, New York, is now one of the 'boroughs' of New York City (q.v.).

Brooks, CHARLES WILLIAM SHIRLEY (1816-74), editor of *Punch*, was born in London. In 1832 he was articled to an Oswestry attorney, but became a reporter, and settling in London, wrote dramas, contributed to some of the leading periodicals and journals, and for five sessions wrote the Parliamentary Summary for the *Morning Chronicle*. By its proprietors he was sent in 1853 on a mission to report on the condition of labour and the poor in Russia, Syria, and Egypt; and a result of his observations appeared in *The Russians of the South* (1856). In 1851 he formed a connection with *Punch*, of which in 1870 he became editor. His novels include *Aspen Court* (1855), *The Gordian Knot* (1860), *The Silver Cord* (1861), and *Sooner or Later* (1868). See his *Wit and Humour* (1875), and the *Life* by H. Johnson (1899).

Brooks, PHILLIPS (1835-93), born at Boston, Massachusetts, studied at Harvard and elsewhere, and in his curacies at Philadelphia (1859-69) and Boston (1869-91) became known as one of the most eloquent and powerful preachers in America. In 1891 he was made Bishop of Massachusetts in the Protestant Episcopal Church. Several volumes of his sermons and lectures (*Lectures on Preaching*, *The Influence of Jesus*) show his independence of judgment and catholicity of spirit. 'O little town of Bethlehem,' a well-known Christmas hymn, was written by him. There is a *Life* of him by A. V. G. Allen (1901).

Brooks's, a London club in St James's Street. It was founded in 1764.

Broom, a name for several species of shrubs of the genera *Cytisus*, *Genista*, and *Spartium*, of the natural order Leguminosae, sub-order Papilionaceae. — Common Broom, *Cytisus* (*Sarothamnus*) *scoparius*, is a well-known native of Britain, Europe, and Northern Asia, growing in dry soils, and ornamenting hedge-banks, hills, and bushy places, in May and June, with the large yellow flowers on its straight slender branchlets. The branches are angular, very tough, and much in use for making besoms, as also for baskets. They have also been used for tanning and dyeing; and their fibre has been woven into a coarse strong cloth, and even made into paper. Its ashes are valuable additions to the soil on account of their high percentage of potash. The whole plant is very bitter, and the young tops and seeds are diuretic, hence the plant is a very unsuitable ingredient of fodder. The flowers were formerly employed in medicine (*flores spartii*), and as a yellow dye; they are much

visited by bees for cross-fertilisation, for which they are very beautifully adapted (see fig.). The mode of diffusion of the seed by the explosive rupture of the dry pod-valves in hot weather is

also worthy of notice. Broom inhabits colder climates than furze, reaching to a greater elevation on mountains, and being found beyond the northern limit of furze. It usually varies in size from 2 to 6 feet, but in some localities grows much larger, the wood then being of great value to cabinet-makers and turners. Although sometimes annoying to the forester, it is also capable of rendering him service as a quick-growing shelter to young trees,

Branch of Common Broom :
a, flowering branch.

especially on wind-swept and sandy soils.—Irish Broom (*Cytisus* or *Sarothamnus patens*), not unfrequent as an ornamental plant in British shrubberies, is not at all a native of Ireland, but of Spain and Portugal.—Portugal Broom or White Broom (*C. albus*), a native of the countries bordering on the Mediterranean, is very often planted in Britain as an ornamental shrub, and is much admired for the beauty of its fasciated white flowers, which are produced upon long filiform branches. Its leaves have three leaflets. It sometimes attains a height of 15 or 20 feet.—Spanish Broom (*Spartium junceum*) is a native of the south of Europe, generally growing in dry soils and rocky situations, and attaining a height of 8 feet or upwards. Its branches are upright, round, and rush-like, a characteristic of this genus. They are smooth, and bear only a few small simple leaves, which soon drop off. It is the *Spartium* of the ancients, and the fibre of the branchlets has been used from time immemorial in some parts of Italy, France, and Spain, for making canvas, nets, ropes, &c., and even for the preparation of a kind of linen. Its twigs also are employed for basket-making, and the finer ones for tying up the grapes. In the south of France, the plant is cultivated on dry unproductive soils. The branchlets are made into bundles, dried, beaten, steeped, and washed, in order to the separation of the fibre. It possesses medical properties similar to those of the common broom.—A white-flowered species (*S. monospermum*), occasionally to be seen in British shrubberies, grows abundantly on the loose sands of the coasts of Spain, and produces a similar fibre. It is mentioned by Barth as growing in great abundance in Africa to the south of the Great Desert. Many species somewhat resembling these are occasionally to be seen in Britain among ornamental

plants, some of them often in greenhouses. The Canary Isles produce some remarkable for the fragrance of their flowers.—Dyer's Broom (*Genista tinctoria*) is, with other members of the same genus, a well-known source of yellow colouring matter. This European shrubby plant is thoroughly naturalised in some parts of North America. The name broom is not given to those species of *Cytisus* and *Genista* (q.v.) which do not display in a marked degree the character of having long slender twigs.—Butcher's Broom (q.v.) is a plant of an entirely different family. See also BRUSHES.

Broom-corn, a grass cultivated in North America for the manufacture of brooms and whisks, which are made of the tops of the culms and the branches of the panicle. See SORGHUM.

Broome, SIR FREDERICK NAPIER, was born in Canada in 1842, and emigrated to New Zealand in 1857. Seven years later, on a visit to England, he married Lady Barker, whose *Station Life in New Zealand* (1869) quickly became popular. In 1869, too, Broome, who had meantime returned to England, formed a connection with the *Times*, and began to contribute prose and verse to the magazines. In 1875 he was appointed Colonial Secretary of Natal, in 1877 of Mauritius, in 1882 Governor of Western Australia, and in 1891 of Trinidad. He was knighted in 1877. He died 26th Nov. 1896.

Broomrape. See ORODANCHEE.

Brora Beds are a series of strata occurring at Brora, a village in Sutherlandshire, of the same age as the Inferior Oolite of Yorkshire. They are chiefly remarkable for the occurrence in them of a seam of coal of good quality $3\frac{1}{2}$ feet thick, being the thickest stratum of true coal hitherto discovered in any secondary strata in Britain.

Brose (Gaelic *brothas*), a dish sometimes used in Scotland, made by pouring boiling water, milk, or the liquor in which meat has been boiled, on oatmeal, and mixing the ingredients by immediate stirring. Butter may be added, and sweet milk when the brose is made with water. It is *kail-brose*, *water-brose*, or *beef-brose*, according to the liquid used. *Athole-brose*, a famous Highland cordial, is a compound of honey and whisky.

Broseley, a small town of Shropshire, on the Severn, now a ward of the borough of Wenlock, famous for its manufacture of excellent clay tobacco-pipes. Its 'churchwardens,' or long clay pipes, are in request all over England.

Brosses, CHARLES DE, historian, was born at Dijon in 1709, and died president of the parliament of Burgundy, 7th May 1777. Among his works were *Lettres sur Herculanum* (1750); *Histoire des Navigations aux Terres Australes* (1756), in which he introduced the name Polynesia; *Du Culte des Deux Fétiches* (1760), the word *fetich* being first used by him in the sense now usual; the ingenious *Traité de la Formation Mécanique des Langues* (1765); and *Histoire de la République Romaine* (1777). His *Lettres écrites d'Italie en 1739-40* was edited by Colomb in 1885. See Marnet, *Le Président de Brosses* (1875).

Broth is an infusion or decoction of vegetable and animal substances in water. It is customary to use more or less meat, ox-flesh or mutton, with bone, and certain vegetables, as cabbage, greens, turnips, carrots, pease, beans, onions, &c. The whole are mixed together in cold water, heat slowly applied, and the materials allowed to simmer for some hours. The meat yields up certain ingredients, whilst others are retained in the residual flesh. Flesh heated with water yields to the water albuminous matter, gelatin, kreatin, extractive matters, lactic acid, salts, fat, saccharine matter; and leaves in the boiled meat fibrin, coagulated albu-

men, gelatinous tissue, fat, nervous matter. The vegetables yield albuminous constituents, colouring and mucilaginous matter, and volatile oils and salts. The real nutritive material present in broth is less than is generally thought, though it aids in satisfying the cravings of the appetite, and acts to a certain extent as a mild stimulant. See SOUP, BEEF-TEA.

Brothels, LAW AS TO. See the article PROSTITUTION.

Brotherhoods, RELIGIOUS, were societies instituted for pious and benevolent purposes, and were numerous in the middle ages. Where the rules of monastic life appeared too narrow and severe, the Catholic Church favoured a freer form of consecrated life without vows other than that of devotion to good works or penitential exercises, but in many other respects, as in living together and the like, resembling the spiritual orders. Such brotherhoods or confraternities were, in earlier times, those of Mary, of the Scapular, and of the Rosary; in later times, that of the Sacred and Immaculate Heart of Mary for the conversion of sinners, that of Francis Xavier or the Mission Brotherhood, and that of Christian Learning (*Frères ignorantins*) for the education of the people. The bridge-building brotherhood (*Frères Pontifices*) originated in Southern France towards the end of the 12th century, and was recognised by Pope Clement in 1189. Their occupation was to keep up hospices at the most frequented fords of great rivers, maintain ferries, and build bridges. Other brotherhoods were the Familiars and Cross-bearers of the Inquisition in Spain, and the *Frères Calendarii* in North Germany and the Netherlands. The great brotherhood of Common Life was founded about 1376 by Geert Groote (born 1340; died 1384) and Florentius Radewin (born 1350; died 1400) at Deventer. Its members were sometimes styled Brethren of Good Will, also Hieronymites and Gregorians, from Hieronymus and Gregory the Great, whom they claimed as patrons. Community of goods, ascetic habits, industry, and the use of the vernacular language in divine service, were some of the chief points insisted on by the brethren who were not fettered by monastic or any other vows. Their principal occupations were the copying of the Bible and other books for the common purse, prayer, and the instruction of the young, and their services in the last direction can hardly be overestimated. Their most famous houses were those of Windesheim, near Deventer, and Agnetenberg, near Zwolle. They became numerous in the Netherlands and North Germany, but also spread themselves in Italy, Sicily, and Portugal, so that in 1430 they reckoned more than 130 societies. The last was founded in Cambrai in 1505. The most important and distinguished members of the society were Gerhard Zerbold of Zutphen, the famous Thomas-à-Kempis, and the learned Cardinal Nicholas Cusa.—Female societies of a similar character sprung up at the same time with those of the Brothers of Common Life. At the head of each was a superior or directress who was styled the *Martha*. See Kettlewell's *Thomas-à-Kempis and the Brothers of Common Life* (2 vols. 1882).

They were usually founded at first without ecclesiastical authorisation, on account of which several of the confraternities that either did not seek or did not obtain the recognition of the church, assumed the character of sects, and were suspected of heresy. To this class, among others, belonged the Beghards and Beguines (q.v.), the Brothers and Sisters of the Free Spirit, the Apostolic Brethren (q.v.), the Flagellants (q.v.), who, tolerated by the church for a while, at last incurred

its displeasure and were severely persecuted. See also CHRISTIAN BROTHERS and CHRISTIAN SCHOOLS. Among Protestants brotherhoods have been formed, as the Rauhies Hans, founded by Wichern at Hamburg in 1833; those formed by Father Ignatius and the Cowley Fathers at Oxford are Anglican brotherhoods. See BENSON. Several similar institutions for women exist within the Church of England. See SISTERHOODS.

Brothers, a name given to three isolated mountains near the coast of New South Wales, between Harrington Inlet to the south, and Port Macquarie to the north. They are valuable as landmarks.—The name is also common to several groups of small islands.

Brothers, LAY, an inferior class of monks, not in holy orders, but bound by monastic rules, and employed as servants in Monasteries (q.v.).

Brothers, RICHARD, a visionary and fanatic, was born at Placentia in Newfoundland in 1757, and in 1772 entered the British navy, which he quitted with a lieutenant's half-pay in 1780. Refusing, from conscientious scruples, to take the oath requisite to enable him to draw his half-pay, he was reduced to great distress, and ultimately placed in the workhouse. In 1793 he announced himself as the apostle of a new religion, 'the Nephew of the Almighty, and Prince of the Hebrews, appointed to lead them to the land of Canaan;' and in 1794 he published a book, *A Revealed Knowledge of the Prophecies and Times*. For claiming the crown as a descendant of David (King of Israel) and as prince of the world, he was committed in 1795 to Newgate, and thence soon transferred to a lunatic asylum. He was released in 1806. His disciples included Nathaniel Hailed the M.P. and orientalist, Sharp the engraver, and Finlayson, a lawyer from Fife, with whom he chiefly resided from 1815 till his death on 25th January 1824.

Brough. See BROCHS.

Brougham, HENRY, LORD BROUGHAM AND VAUX, was born in Edinburgh, 19th September 1778. His father, Mr Henry Brougham, was the descendant of an old Westmoreland family, and his mother, Eleanor Syme, a woman of great worth and beauty, was a niece of Robertson the historian. Brougham received his education at the High School and at the university of Edinburgh. He gave early promise of future ability, some scientific papers written by him at the age of eighteen finding admission to the Transactions of the Royal Society. In 1800 he was admitted to the Scottish bar; in 1802 he helped to found the *Edinburgh Review* (q.v.), to whose first twenty numbers he contributed eighty articles. His Liberal views shut him out from the hope of promotion in Scotland, and a character which he had acquired for eccentricity and indiscretion excluded him from all legal practice, except the unremunerative practice of the criminal courts. In 1805 he settled in London; in 1806 was for three months secretary to a mission to Lisbon; and in 1808 was called to the English bar.

In London he first made his mark at the bar of the House of Commons as counsel for the Liverpool merchants who petitioned against the Orders in Council. Shortly after, in 1810, he entered parliament, and four months later brought in and carried his first public measure—an act making participation in the slave-trade felony. He was welcomed by the opposition leaders, to whose party he had attached himself, as a most powerful assistant in their attacks upon the government. In 1812 he succeeded in carrying the repeal of the obnoxious Orders in Council, and then ventured to contest the membership for Liverpool against Canning. He was defeated, and remained without

a seat till 1816, when he was returned for Winchelsea, and again became an active member of the opposition. By this time he had also established some reputation in the courts of law. He never, indeed, acquired a very large practice, but he repeatedly distinguished himself by speeches of great vigour and ability in the defence of persons prosecuted for libel by the crown. His most famous appearance as an advocate, however, was in defence of Queen Caroline (1820). His eloquence and boldness, though they forfeited for him the favour of the crown, gained him that of the people, and for the ten years between 1820 and 1830 Brougham was the popular idol. He made no bad use of his power. In 1822 he used it, though in vain, in support of a scheme of national education; and to his activity was due, in great measure, the establishment of the London University, of the first Mechanics' Institute, and of the Society for the Diffusion of Useful Knowledge. In 1830 he delivered a powerful speech against slavery, and in consequence of it—so he himself believed—was invited to stand, and returned, as member for the great popular constituency of the county of York. The aristocratically disposed Whigs would, had they dared, have excluded Brougham from the Reform ministry; but, in addition to his enormous popularity, he was virtually their leader in debate in the Commons, and thus, in spite of his unmanageableness, was indispensable. After various intrigues he was offered, and was persuaded, to accept a peerage and the chancellorship. He took his seat in the Lords in November 1830, and assisted materially in carrying the Reform Bill through that house. But his arrogance, self-confidence, and eccentricities, which sometimes verged on insanity, rendered him as unpopular with his colleagues as he was on the bench. He went out with the Whig government in 1834, and on its reconstruction five months later, found himself quietly shelved. He never held office again, never thenceforth exerted any appreciable influence on any great political movement, though still as before he continued to forward every measure for social progress, and was founder of the Social Science Association (1857).

It is as a law-reformer that Brougham will be best remembered. He took up Romilly's uncompleted task of carrying into practice the ameliorations suggested by Bentham. His efforts in this direction began as early as 1816, when he introduced into parliament a bill to remove various defects in the law of libel. In 1827, in a memorable six hours' speech, he enumerated the defects in nearly every branch of English law, and made proposals for dealing with law-reform on a proper scale. These, as might have been expected, met with little encouragement. It has been the fortune of many of his measures to be carried afterwards, in a mutilated form, by other hands. After he left office, Brougham also succeeded in carrying various reforms in the law, among which may be noted some very extensive changes in the law of evidence. His acts and bills, as well as those regarding the slave-trade, education, and other public questions, as those touching on law-reform, were collected and published by Sir J. E. Eardley Wilmot (1857). The large volume they form is the most fitting monument that could be preserved of the activity, perseverance, and public spirit of the man.

As an orator, more especially as a debater in parliament, Brougham was, among the men of his time, inferior only to Canning. He was wont, however, to indulge in his speeches in too large an admixture of exciting elements; argument was mingled with fiery declamation; ridicule,

sarcasm, invective, were freely used; and these he dealt out with a vehemence and energy that at times carried him far beyond bounds. The power of ready, rapid, and forcible diction was pre-eminently his. In many other fields besides oratory he won a high reputation. He cultivated mathematical and physical science, and ventured upon the domains of metaphysics, history, theology, even romance. His miscellaneous writings are upon an almost incredible variety of subjects, and, numbering 133, fill 11 vols. in the collected edition (1855-61; 2d ed. 1873). They were, however, intended more to serve purposes of the moment, than as permanent additions to our literature; and though they display great powers of rapid comprehension and nervous clear exposition, it cannot be said that we are indebted to their author for any new truths in politics or morals, or any original discoveries in science.

While not engaged in parliament, Brougham chiefly resided at Cannes, in the south of France, where he had built a château in 1835, and where he died 7th May 1868. Two daughters had long predeceased him, and the title passed to his brother William (1795-1886). Brougham's memoir of his own Life and Times (3 vols. 1871) was written in extreme old age, and is very untrustworthy. Peacock hit him off well in *Crotchet Castle* as 'the learned friend'; and Rogers remarked of him, as he once was leaving Panshanger, 'There goes Solon, Lysurgus, Demosthenes, Archimedes, Sir Isaac Newton, Lord Chesterfield, and a great many more in one post-chaise.' O'Connell's gibe was less kindly: 'If Brougham knew a little of law, he would know a little of everything.' See Atlay's *Victorian Chancellors* (vol. i. 1906).

Broughton, LORD. See HOBHOUSE (J. C.).

Broughton, RHODA (1840-1920), the daughter of a cleigyman, made a name for herself by her novel *Not Wisely but Too Well* (1867). Others are *Cometh up as a Flower* (1867), *Red as a Rose is She* (1870), *Nancy* (1873), *Joan* (1876), *Belinda* (1883), *Doctor Cupid* (1886), *Alas!* (1890), *A Beginner* (1894), *Scylla and Charybdis* (1895), *Dear Faustina* (1897), *The Game and the Candle* (1899). Her later works are not her best. Her plots are usually but ill constructed, her cynicism is shallow and unreal, and her stories too often contain equivocal situations unjustified by dramatic necessity; but the work shows a vigorous individuality, and the style is clever and graphic, though too often marred by a vulgarity that seems in grain. 'In Miss Broughton's determination not to be mawkish or missish,' says Mr Trollope, 'she has made her ladies do and say things which ladies would not do and say.' Her heroines need not be so often plain, so often extravagantly worship or detest their parents, nor take such an unconscionable time in dying; while her abuse of italics and the present tense are devices that are merely monotonous, and add no strength to the work of so clever a writer.

Broughty-Ferry, a town of Forfarshire, on the Firth of Tay, absorbed in 1913 by Dundee. It is connected with Tayport, in Fife, by a railway-ferry over the firth, here a mile broad, which, before the opening of the Tay Bridge, to the westward, formed the chief means of approach from Edinburgh and Fife to Dundee. Many Dundee merchants occupy fine villas at Broughty-Ferry, and it enjoys all the amenities of a favourite watering-place. On the shore stands a castle, which, built in 1498, was held by the English 1547-50. In 1860-61 it was repaired as a defence for the Tay. Pop. (1861) 3513; (1891) 9256; (1911) 11,058.

Broussa, BRUSA, or BOURSAS, the ancient *Prusa*, where the kings of Bithynia usually resided, situated in Asiatic Turkey, at the foot of Mount

Olympus, in Asia Minor, some 20 miles by rail SE. of its port Mudania on the Sea of Marmora. The town is beautifully situated, facing a luxuriant plain. Water flows down the centre of some of the streets, which are clean, but for the most part narrow and dark, and the bazaars very good. It contains about 200 mosques, some of which are very fine buildings, also three Greek churches, an Armenian and several synagogues. The old citadel stands on a rock in the centre of the town. Both Greeks and Armenians have an archbishop here. The silks of Broussa are much esteemed, but the production of the silk-factories, many of which are in the hands of Europeans, has fallen off. Wine is largely produced by the Greeks, and fruit is exported; carpets and tapestry are also made. As capital of a vilayet (often called Khodavendighiar), Broussa is the official residence of a Turkish pasha, and the seat of a Turkish tribunal. Broussa is subject to frequent earthquakes. In ancient times it was famous for its thermal baths, which are still much esteemed; they are sulphurous, and spring out of the flank of Mount Olympus. During the terrible earthquakes of 1855, they ceased for a time to flow, but soon returned with a fuller current than before. Meerschaum clay is also obtained from a hill in the vicinity. Prusa is said to have been built by Prusias, king of Bithynia. It was plundered by the Saracens in 950, but retaken and fortified. The sultan Othman besieged it in 1317; and in 1327 his son Orkhan, the second emperor of Turkey, captured it, and made it the capital of his empire, and it continued so until the taking of Constantinople by Mohammed II. in 1453. The first six sultans of the Ottoman empire are buried here. Ibrahim Pasha occupied the city in 1833; Abd-el-Kader found refuge here from 1852-55. The population is about 100,000. After the Great War the district was held by the Greeks till 1922.

Broussais, FRANÇOIS JOSEPH VICTOR, the founder of a theory of medicine, was born at St Malo, 1772, and served as a surgeon in the navy and army. In 1820 he was appointed professor at the military hospital of Val-de-Grace. In 1830 he became professor of General Pathology in the Academy of Medicine in Paris, and afterwards was made a member of the Institute. He died at Vitry in 1838. His peculiar views are fully explained in his chief work—the *Examen de la Doctrine Médicale Généralement Adoptée* (1816), which asserts the following principles: that life is sustained only by excitation or irritation; that this excitation may be either too strong (*surexcitation*) or too weak (*adynamie*). These abnormal conditions at first manifest themselves in a specific organ of the body, but afterwards, by sympathy, are extended to other organs, as in fever—i.e. all diseases are originally *local*, and become *general* only by sympathy of the several organs. His theory and practice, which strongly resemble the Brunonian system of John Brown (q.v.), gained many adherents in France, who took the name of the 'Physiological School.'

Broussonetia. See MULBERRY.

Brouwer (sometimes written BRAUWER), ADRIAEN, a Dutch painter, was born at Oudenarde (now in Belgium) in 1605 or 1606, of extremely poor parents, studied at Haarlem under Franz Hals, and about 1630 settled at Antwerp. Here, under the influence of Rubens, who thought highly of him, he attained to great brilliancy of colour; and from the beginning he had shown great power of strong and graphic characterisation. His favourite subjects were scenes from tavern life, country merrymakings, card-players, smoking and drinking groups, and roisterers generally. His life

was dissipated and embarrassed by debt; and he died of the plague in an Antwerp hospital in 1638, not yet thirty-three years of age. His influence was marked on Teniers the younger, Van Ostade, and others. His best pictures are at Munich, St Petersburg, Madrid, Dresden, and Vienna. See *Lives* by Schmidt (Leip. 1873) and Bode (Vienna, 1884; Berlin, 1924).

Brown, MOUNT, in the Rocky Mountains, near the source of the Columbia River, and on the borders of British Columbia and Alberta, is 9000 feet high.

Brown, CHARLES BROCKDEN, an American novelist, of Quaker ancestry, was born at Philadelphia, January 17, 1771. After abortive studies in law he adopted literature as a profession, the first American to do so. *Wieland* (1798), the earliest of his fictions, was followed in 1799 by *Ormond, or the Secret Witness*, in which the character of Constantia Dudley was greatly admired by Shelley. Other novels were: *Arthur Mervyn, or Memoirs of the Year 1793*—the fatal year of yellow-fever in Philadelphia; *Edgar Huntly, or the Adventures of a Sleep-walker* (1801); *Clara Howard* (1801); and *Jane Talbot* (1804). He died of consumption, February 22, 1810. Brown had great imaginative and psychological ingenuity. He invents incidents and analyses feelings with remarkable subtlety, but his success is marred by lack of reality and extravagance. As a novelist he owed much to Godwin. A *Life of Brown* by W. Dunlap was prefixed to the edition of his novels in 7 vols. (Boston, 1827); there is another edition in 6 vols. (Philadelphia, 1857); re-issued, 1887). See *Life* by W. H. Prescott (1834).

Brown, FORD MADDOX, historical painter, one of the most intellectual, forcible, and unconventional artists of his time, grandson of the founder of the Brunonian system of medicine, was born at Calais in 1821. His earlier studies were conducted mainly at Antwerp, under Baron Wappers, who, in his turn, had been influenced by the Romantic school of France; and, after a brief period spent in portrait-painting in England, he resided for three years in Paris, where he produced his 'Manfred on the Jungfrau' (1841), and 'Parisina's Sleep' (1842), works intensely dramatic in feeling, but sombre in colouring. In 1844-45 he contributed three subjects to the Westminster cartoon competitions, preliminary to the mural decoration of the Houses of Parliament, works praised by Haydon, though they gained no prize; and one of them was carried out in 1861 as an oil-picture, titled 'Willelmus Conquistator,' one of the most dignified and monumental of the artist's productions. A visit to Italy about 1845 led him to seek greater variety and richness of colouring, and its results were seen in 'Wyclif reading his Translation of the Scriptures to John of Gaunt' (1848), and 'Chaucer reciting his Poetry at the Court of Edward III.' (1851). Already his art had been developing new aims, which demanded fresh methods for their expression; and gradually he formed a style characterised by great originality, force, and directness, much in harmony with that of the Pre-Raphaelites, and, in point of time, anticipating their efforts. In 1850 he was a contributor of verse, prose, and design to the Pre-Raphaelite magazine the *Germ*, and in his youth Rossetti worked in his studio. Among the most important works in his fully developed manner are 'Cordelia and Lear,' 'Christ washing Peter's Feet,' 'Work,' 'The Last of England,' 'Romeo and Juliet,' 'The Entombment,' 'Cromwell dictating the Vaudois Despatch to Milton,' and, in landscape, the 'English Summer Afternoon.' In 1865 he held an exhibition of his collected works in London, the interesting and valuable descriptive catalogue of which was written by himself. He was known to

some extent as a book-illustrator, and among his designs for stained glass are the windows of St Oswald's, Durlam. From 1879 till a few months before his death—which took place on the 6th October 1893—he was engaged upon a great series of twelve subjects from local history for the town-hall of Manchester. They are executed by the Gambier-Parry process, the earlier works being painted directly upon the prepared surface of the walls, and some of the later upon canvas.—His son, OLIVER MADOX BROWN, author and artist, was born at Finchley, 20th January 1855. At the age of twelve he executed a water-colour subject—'Margaret of Anjou and the Robber'—of very considerable merit; two years later his 'Chiron' was shown at the Dudley Exhibition; in 1870 his equestrian 'Exercise' found a place on the line in the Royal Academy; and already two of his designs, 'The Deformed Transformed' and 'Mazeppa,' had been engraved. In 1871-72 he wrote his first novel, published in an altered and mutilated form in 1873, under the title of *Gabriel Denver*, and reprinted in original form and under its first title of *The Black Swan* in his *Literary Remains* (1876). As the work of a lad under seventeen, it is a marvellous production. The tales of *The Dwale Bluth* and *Hebditch's Legacy*, with some minor narrative pieces, were left incomplete at the time of their author's death. As a poet he was no less precocious. At the age of fourteen he had written several remarkable sonnets; and from time to time he produced lyrics and other fragments in which the dominant note is that same passionate intensity which is the main characteristic of his fiction. His promising career was cut short; he died of blood-poisoning on the 5th November 1874.

See a life of the father by Ford Madox Hueffer (1893), and of the son by J. H. Ingram (1883).

Brown, Sir George, British general, was born at Linkwood, near Elgin, in 1790, and entered the army in 1806. He served through the Peninsular campaign (1808-13), and in 1814 joining Ross's expedition against the United States, was wounded at the battle of Bladensburg, and obtained his lieutenant-colonelcy. In the Crimean war (1854-55) he commanded the Light Division, and was severely wounded at Inkermann. In 1855 he was created a G.C.B., and in 1856 was gazetted 'General for distinguished service in the field.' In 1860 he became commander-in-chief in Ireland, and he died at Linkwood, 27th August 1865.

Brown, George Loring, American artist, born in Boston, 2d February 1814, spent more than twenty years in the art-centres of Europe, and returned to America in 1860 with a high reputation as a landscape-painter. His works include American and Italian landscapes of considerable merit, among the more important being 'The Crown of New England' (1861), 'Niagara by Moonlight' (1876), and Venetian scenes. He died 25th June 1889.

Brown, Henry Kirke, sculptor, born at Leyden, Massachusetts, in 1814. He studied for some years in Italy, and returning in 1846, settled at Brooklyn, where he executed the first bronze statue ever cast in America. Besides several subjects in marble, his notable works include statues of Lincoln in Brooklyn and New York, an equestrian statue of General Scott in Washington, and a colossal equestrian statue of General Washington in Union Square, New York. He died July 10, 1886.

Brown, John, of Haddington, author of the *Self-interpreting Bible*, was born in 1722 at Carpow, near Abernethy, Perthshire. A poor weaver's child, at the age of eleven he lost both father and mother, and himself shortly afterwards all but died

of four fevers. His schooling was scanty; but, as a herd-boy on the Tayside hills, he studied Greek, Latin, and Hebrew with such success that the neighbours declared he had dealings with the evil one. Once, after folding his flock, he set off for St Andrews, 24 miles away, and stood the next morning in a bookseller's shop, inquiring the price of a Greek Testament. The man laughed at him; but a professor, who was in, said he would give him one if he could read a verse. Ay, could he; and so the Testament was his. Then he turned pedlar, a pedlar like him in Wordsworth's *Excursion*; during the '45 served in the Fife militia; and from 1747 to 1750 was a schoolmaster at Garney Bridge, near Kinross, and at the Spittal, near Penicuik. The vacations were devoted to theological study in connection with the Associate Burgher Synod; and in 1751, having the year before been licensed to preach, he was called to the congregation at Haddington. He was a man of great learning, knowing Latin, Greek, Hebrew, Arabic, Syriac, Persian, and Ethiopic, French, Spanish, Dutch, German, and Italian; open-handed, on a stipend of from £40 to £50 a year; not narrow-minded, the age and his station considered; a kindly humorist, though harrowing self-doubts tormented him all his life through; and a powerful preacher, witness David Hume's well-known remark: 'That's the man for me, he means what he says; he speaks as if Jesus Christ was at his elbow.' In 1768 he accepted the unsalaried Burgher chair of Divinity; in 1784 he refused the pastorate of the Dutch Church at New York; and on 19th June 1787 he died at Haddington. Of his twenty-seven ponderous works, published between 1758 and 1804, and dealing with the Scriptures, church history, &c., the most widely known are the *Dictionary of the Bible* (1768) and the *Self-interpreting Bible* (2 vols. 1778), whose object was 'to condense within a reasonable space all the information which the ordinary reader may find necessary for attaining an intelligent and practical knowledge of the sacred oracles.' See his *Memoirs and Select Remains*, edited by the Rev. W. Brown (Edin. 1856).

JOHN BROWN, D.D., his grandson, was son of the Rev. John Brown of Whitburn (1754-1832), and nephew to the Rev. Ebenezer Brown of Inverkeithing, whose eloquence amazed Brougham and Jeffrey. Born in 1784, he studied at Edinburgh University from 1797 to 1800, and then, not yet sixteen years old, left home with his father's blessing and a guinea, to keep school for three years at Elie, meantime attending, during the summer vacations, the Burgher Theological Hall at Selkirk. In 1806 he was ordained to a pastorate at Biggar; in 1822 accepted a call to Rose Street Church, Edinburgh; and thence in 1829 was translated to Broughton Place. Created a D.D. of Jefferson College, Pennsylvania, in 1830, he was elected professor of Exegetical Theology in 1834; during 1840-45 was engaged in the vexatious atonement controversy; and died 13th October 1858. He published close upon twenty religious works; but for us the interest is in the man himself, strong, saintly, learned, yet with a passion for riding, and 'a steady liking, nay hunger, for a good novel.' See Dr Cairns's Memoir of him (1860), and especially the letter, appended thereto, by his son.

That son, DR JOHN BROWN, the essayist, was born at Biggar, 22d September 1810. Till 1822 his education was undertaken by his father, who had lost his first wife in 1816; then, when the family removed to Edinburgh, the boy had four years at a classical academy and the High School. In 1826 he entered on the arts course at the university, and in 1828 on the medical, at the same time becoming pupil and apprentice to Syme, the eminent surgeon. In 1833, after a year spent at Chatham

—the great cholera year—as a surgeon's assistant, he graduated M.D., and at once established a practice in Edinburgh. It never was large, for he was something besides a doctor, and nothing at all of a money-getter. His life was quiet and uneventful, save that its latter years, all but the last one, were clouded by fits of the darkest depression. The end came somewhat suddenly, but sweetly, on 11th May 1882. He is buried beside his father in the New Calton Cemetery. Almost all Dr John Brown's writings are comprised within three volumes—the two *Horæ Subsecivæ* ('leisure hours,' 1858-61), and *John Leech and other Papers* (1882). Editors and publishers had to 'pester' him to write, for he was distrustful, as few men, of his powers, believing that none should venture to publish aught 'unless he has something to say, and has done his best to say it aright.' Herein lay the secret of his writing so little, and of that little's hyper-excellence. Dogs, children, old-world folk, friends gone before, and lowland landscapes—these are the subjects which he wrote on best; his essays on art and medical topics are good, but it is not by them that he will be remembered. Humour is the chief feature of his genius—humour with its twin-sister pathos; we find them both at their highest perfection in his sketches of 'Rab' and 'Marjorie'—the uncouth mastiff and the dear dead child. Then, silent Minchmoor, the Enterkin's wild pass, and peaceful Inchmahome—he is to them what Wordsworth is to Yarrow; himself to Yarrow he applied that most exquisite epithet, 'fabulosus as ever Hydaspes.' Writing of nothing that he did not know, he wrote, too, of nothing that he did not love, or at least did not greatly care for. Hence both the lucidity and the tenderness of his essays. They rank with Lamb's, and with Lamb's alone in the language. See Swinburne's Sonnet; *John Brown and his Sister Isabella*; *Peddie's Recollections* of him; J. T. Brown's *Life of him* (1903); and his own *Letters* (edited 1907).

SAMUEL BROWN, M.D., chemist, was a grandson of John Brown of Haddington, and son of Samuel Brown, provost of that burgh (1779-1839), who in 1817 established the East Lothian itinerant libraries. Born in 1817 at Haddington, he was educated there till 1830, when he entered the Edinburgh High School. Thence in 1832 he passed on as a medical student to the university, and, after a visit to St Petersburg (1837-38), graduated M.D. in 1839, but immediately surrendered himself to the fascination of chemistry. The dream of his life was the possibility of reconstructing the whole science of atomics, and to its experimental realisation he devoted his nights and days with all the self-forgetful ardour of the medieval alchemist. In 1843 he delivered in Edinburgh four memorable lectures on the atomic theory, but in the same year was unsuccessful in his candidature for the chair of Chemistry. His noble sincerity of nature, his subtlety and versatility of intellect, and his brilliant conversational powers endeared him to a group of friends that included such figures as Edward Forbes, De Quincey, Jeffrey, Carlyle, Harriet Martineau, and Emerson. For some years his health was uncertain, and he died at Edinburgh, 20th September 1856. He was author of the *Tragedy of Galileo* (1850), a monograph on his father (1856), and two admirable volumes of *Essays, Scientific and Literary* (1858), on Chemistry, Nature and Man, Christianity, George Herbert, David Scott, Physical Puritanism, Magnetism, Ghosts, &c. See *North British Review*, Feb. 1857.

Brown, JOHN, M.D., founder of the Brunonian system of medicine, born in 1736, of poor parents, in Bunkle parish, Berwickshire, was educated at the grammar-school of Duns. At school he was looked upon as a prodigy, his physical powers were great,

he possessed strong intelligence, and an extraordinary memory. After acting as teacher and tutor in Duns and Edinburgh, he obtained leave from Monro, professor of Anatomy, and the other professors, to attend their lectures free; meanwhile he was tutor to the children of the celebrated Dr Cullen, and became his assistant in his university lectures. Conceiving himself slighted by Cullen, he commenced giving lectures himself upon a new system of medicine, according to which all diseases are divided into the sthenic, or those depending on an excess of excitement, and the asthenic, those resulting from a deficiency of it; the former to be removed by debilitating medicines, as opium, and the latter by stimulants, such as wine and brandy. His system, in which he freely exposed the errors of former systems, and those of Dr Cullen, gave rise to much opposition, but his partisans were numerous; for a time his opinions had some influence, and what was true in his lectures has been gradually adopted in ordinary medical treatment. In 1779 he took the degree of M.D. at the university of St Andrews, and in 1780 published his *Elementa Medicinæ*. He was noted for the freedom with which he wrote and spoke Latin. A life by Dr Beddoes of Bristol was prefixed to the second edition (2 vols. 1795) of Brown's own English translation. The book was reprinted on the Continent and in America, and translated into French, Italian, and German. He also wrote *On the Present System of Spasm as Taught in the University of Edinburgh* (1787), and a *Short Account of the Old Method of Cure*. Being overwhelmed with debt, for which he was at one time thrown into prison, in 1786 he removed to London, where he was again in difficulties. Just as his prospects had begun to brighten, and as he had arranged with a publisher to produce a work on gout for £500, with literary work mapped out for ten years to come, he was struck down by apoplexy, of which he died, 17th October 1788. His works were edited, with a memoir by his son, Dr William Cullen Brown (3 vols. 1804). The merits and demerits of the Brunonian system continued to be matter of controversy both in Europe and the colonies long after the death of its founder. Vol. ii. of Thomson's *Life of Cullen* (1859) is largely occupied with a discussion of the system; and Hirschel published, in German, a *History of the Brunonian System* (1846).

Brown, JOHN, of Ossawatomie, an American abolitionist of the most extreme type, was born at Torrington in Connecticut on the 9th May 1800. Descended in the sixth generation from Peter Brown, one of the *Mayflower* pilgrims, he preserved the stern religious enthusiasm of his ancestors. In 1805 his father, Owen, removed to Hudson, Ohio, and in 1812 had a contract to supply Hull's army with beef. John, already a vigorous lad, accompanied his father to Detroit, and acquired a hatred of both war and slavery. He became a tanner and land-surveyor, and from 1825 to 1835 lived at Richmond, Pennsylvania, where he was made postmaster. Returning to Ohio he engaged in land speculations, which proved disastrous, and then turned shepherd. In 1846 he removed to Massachusetts, but in 1848 purchased a farm at North Elba, New York. He wandered much through the country in prosecution of anti-slavery enterprises, in which he was assisted by his family. He was twice married and had twenty children. In 1854 five of his sons removed from Ohio to Kansas, and he joined them in the next year after the border conflict had begun. Brown became a leader in the strife, and two of his sons were arrested by United States cavalry. Soon after the town of Lawrence was sacked by border ruffians, he ordered five pro-slavery men at Pottawatomie to be slain as dangerous. Ossawatomie,

Brown's home, was burned August 30, 1856, and his son killed. When the war in Kansas ceased, Brown began to drill men in Iowa, using rifles which had been sent to him from Massachusetts. His scheme then was to establish a stronghold in the mountains of Virginia as a refuge for runaway slaves. This plan was disapproved by the few to whom he mentioned it, and he resumed anti-slavery work in Southern Kansas. In June 1859 he hired a farm near Harper's Ferry, and here gathered twenty-two men, of whom six were coloured. Boxes of rifles, pistols, and pikes were also received. On Sunday night, October 16, with eighteen men, he broke into the United States armoury in the town and took several citizens prisoners. On Monday some fighting took place, and Colonel Robert E. Lee, with a company of marines, arrived from Washington. Lieutenant J. E. B. Stuart, who accompanied them, recognised Brown, whom he had met in Kansas. Brown, with six men, now driven into the engine-house, refused to surrender, and continued to fight until his two sons were killed and himself severely wounded. Brown was tried by a Virginia court for conspiracy to produce insurrection, for treason, and for murder. He was convicted and hanged at Charlestown, Virginia, December 2, 1859, having shown the utmost firmness throughout his imprisonment. Four of his men were executed with him, and two others later; six escaped. The raid was investigated by a committee of the United States senate. Its full effects were not seen until the civil war was over.

See Lives by Redpath (1860), Sanborn (1885), Chamberlin (1900), and—especially—Villard (1910).

Brown, ROBERT, an eminent botanist, the son of an Episcopal clergyman, was born at Montrose, Scotland, December 21, 1773, and educated there and at Marischal College, Aberdeen. While a student of medicine at the university of Edinburgh, he evinced a strong taste for botanical studies. He became, in 1795, ensign and assistant-surgeon in a Scottish Fencible regiment, with which he went to Ireland. In 1798 he visited London, and was introduced to Sir Joseph Banks, who gave him the free use of his collections and library. Devoting himself to the study of botany, he resigned his commissions in 1800, and the following year was, on the recommendation of Sir Joseph Banks, engaged as naturalist in the expedition sent out under Captain Flinders for the survey of the Australian coasts. On his return in 1805 he brought home nearly four thousand species of Australian plants, a large proportion of which were new to science. Soon after, he was elected an associate and appointed librarian to the Linnean Society. To the *Transactions* of the Edinburgh Wernerian Society, and those of the Linnean Society, he contributed memoirs on *Asclepiadaceæ* and *Proteaceæ*, and published *Prodromus Floræ Novæ Hollandiæ et Insulæ Van Diemen*. He also wrote on the botany of Flinders's expedition (1814). His adoption of the natural system of Jussieu led to its general substitution in place of the Linnean method. He observed the vibratory 'Brownian Movements' of microscopic particles, vegetable or mineral, when suspended in water. They are distinguished from the movements of active microscopic germs, having no movement of translation; and Stanley Jevons showed that the *diapedesis*, as he called it, varied greatly as the surface tension of the fluid was modified by substances in solution. As keeper of the Banks library and collections, Brown was made keeper of the botanical department of the British Museum when in 1827 the Banks collections were transferred thither. F.R.S. (1811), D.C.L. (1832), and according to A. von Humboldt 'facile princeps botanicorum', he was from 1833 one of the foreign

associates of the Academy of Sciences or the Institute of France. In 1839 the Royal Society awarded him their Copley medal. Sir Robert Peel granted him a pension on the Civil List of £200 a year. He was president of the Linnean Society from 1849 to 1853. Darwin thought him 'chiefly remarkable for the minuteness of his observations, and their perfect accuracy. His knowledge was extraordinarily great; much of it died with him, however, owing to his morbid fear of committing himself to mistakes. Brown died in London, 10th June 1858. A translation of Brown's miscellaneous works was published in Germany in 1825-34. The Ray Society in 1866-68 reprinted his complete works, except the *Prodromus*, under the editorship of J. J. Bennett. See BOTANY.

Brown, THOMAS, a Scottish metaphysician, born in 1778 at the manse of Kirkmabreck, Kirkcudbrightshire, went to Edinburgh in 1792, and for several years attended the university, though without ever completing the arts curriculum. He began the study of the law, but shortly abandoned it for medicine, and became in 1806 the partner of Dr Gregory in his large practice. His strong bent, however, was for literature and philosophical speculation. At the age of twenty he had published a refutation of Darwin's *Zoonomia*, and he contributed at the outset to the *Edinburgh Review*. In 1804 appeared his essay on *Cause and Effect*, in which he holds that there is nothing in a cause but the fact of immediate and invariable antecedence to the change called its effect. Dugald Stewart, professor of Moral Philosophy in the university, being obliged, from bad health, to retire in 1810, Brown was appointed colleague and successor, which office he continued to discharge till his death during a visit to London, 2d April 1820. He was popular as a professor; and his *Lectures*, published after his death, reached its 19th edition in 1851, although the book has now fallen into neglect. He also wrote a good deal of rather indifferent poetry. Brown attempted to overturn the psychological system of his predecessors, Reid and Stewart, and to substitute a new and simplified scheme of mental phenomena, including a sixth or *muscular sense*.

Brown, THOMAS EDWARD (1830-97), son of a clergyman at Douglas in the Isle of Man, from Christ Church, Oxford, was elected a fellow of Oriel, and for thirty years (1863-92) was master at Clifton College. The rest of his life he spent in his beloved native island. Some of his lyrics are admirable; his notablest works were narrative poems in Manx English. *Betsy Lee* appeared in *Macmillan's Magazine* in 1873, and with other poems was included in *Fo'c's'le Yarns* (1881). Other collections were named from *The Doctor* (1887), *The Manx Witch* (1889), and *Old John* (1893); and all his poems were collected in one volume in 1900. See his Letters (2 vols. 1900), with memoir by Irwin.

Brown, TOM, 'of facetious memory' in Addison's phrase, was born at Shifnal, Shropshire, in 1663. His studies at Christ Church, Oxford, were most probably cut short by his irregularities, but are remembered by his clever extempore translation and application to Dr Fell, the dean of Christ Church, of Martial's epigram, 'Non amo te, Sabidi.' 'I do not love thee, Dr Fell, the reason why I cannot tell.' After a few years of teaching at Kingston-on-Thames, he settled in London, where he made an uncertain living by writing satirical poems and pamphlets, many of them remarkable more for their vigour and scurrility than their wit. He is principally interesting now as the assailant of much better men than himself, among them Dryden, Sherlock, Tom Dufey, and Sir Richard Blackmore. He lived a shifty and

disreputable life, and died 16th June 1704, being fittingly buried near his friend, Mrs Afra Behn. His works were collected into 3 vols. (1707-8).

Brown, SIR WILLIAM, founder of the Liverpool Free Library, was born at Ballymena, County Antrim, in 1784, and sailed in 1800 with his parents for Baltimore, U.S. Returning in 1809, he established at Liverpool a branch of his father's linen business, and laid the foundation of one of the largest mercantile firms in the world. A liberal reformer and able advocate of a decimal coinage, he took a prominent part in local and public affairs, and unceasingly promoted the education of the people. In 1844 he vainly contested South Lancashire, but was returned for it in 1846, and was thrice afterwards re-elected. In 1857, at a cost to himself of £40,000, he founded the Free Public Library of Liverpool, and in 1859 he raised a corps of volunteer artillery. He was made a baronet in 1863, and died 3d March 1864, leaving a fortune of £900,000 personality.

Brown Coal. See LIGNITE.

Browne, CHARLES FARRAR, one of the most typical of American humorists, commonly known by his pseudonym 'Artemus Ward,' was born in Waterford, Maine, 26th April 1834. He began life as a printer and learned type-setting in the office of the *Skowhegan Clarion*, Maine, but soon removed to Boston, and thence to Toledo and Cleveland. Meantime he had become a reporter and contributor to the newspapers. In 1858, under the style of 'Artemus Ward, showman,' he wrote for the *Cleveland Plaindealer* a description of an imaginary travelling menagerie. This was followed by letters professedly from the same source, in which grotesque spelling and an inextricable interweaving of business puffery and moralising served to convey sound sense and shrewd satire. The letters were widely circulated, and the author was invited to a share in the editorship of a new comic paper, *Vanity Fair*, in New York. In the stress of war times the paper failed, after a brilliant career, and in December 1861 'Artemus Ward' entered the lecture field. Under the title, *The Babes in the Wood*, he delivered a telling satire on the dull twaddle which had been imposed on the public by pompous bores. Such was its success that a theatrical manager in California telegraphed to him, 'What will you take for forty nights in California? Answer immediately.' His prompt reply, 'Brandy-and-water,' assured him a welcome among the miners. Making his way thither by stage-coach over the plains and Rocky Mountains, 'Ward' had some experience with the Indians, and especially with the Mormons, 'whose religion,' he afterwards explained, 'is singular, but their wives are plural.' As an adjunct to his lectures on these attractive topics, he got a panorama, whose artistic wretchedness furnished occasion for countless jokes. In 1864 the lecturer was disabled by pulmonary consumption. In 1866, having rallied somewhat, he went to England, where he was received in the most friendly manner. He contributed to *Punch*, still in the character of 'the genial showman.' In November he opened the exhibition of his panorama in Egyptian Hall in London, and achieved great popularity as a representative of American humour. Though the seal of death was on his features, he did not abate any of his quaint originality and amusing satire. His keen observation and graphic revelation of human nature stood forth from a background of truisms, which removed for a time any suspicion that the satire was aimed at the audience. In February 1867 Browne went for the benefit of his health to the Isle of Jersey, but returned to die at Southampton, England, 6th March 1867. He was deeply beloved by his asso-

ciates, and tenderly devoted to his mother, to whom he left a modest competence.

His works were gathered into several volumes: *Artemus Ward, His Book, &c.* (1862-67); and M. D. Landon prefixed a Life to a collected edition (1875). His *Best Stories* were edited by Clifton Johnson in 1913.

Browne, EDWARD GRANVILLE (1862-1926), Oriental scholar, was born at Uley, Gloucestershire, and educated at Glenalmond, Eton, and Pembroke College, Cambridge. He soon turned his interest to the study of oriental languages and religions, and was lecturer in Persian at Cambridge from 1888 till 1902, when he became Sir Thomas Adams, Professor of Arabic. His monumental *Literary History of Persia* (4 vols. 1902-24), covering the period from the Fidausi to the present, is but one of many valuable publications. He was a sturdy friend of freedom.

Browne, EDWARD HAROLD (1811-1891), born at Morton House, Bucks, and educated at Eton, and at Emmanuel, Cambridge, was professor of Hebrew at Lampeter (1841), and of Divinity at Cambridge (1854), Bishop of Ely (1864), and of Winchester (1873). He wrote on the Pentateuch and the Thirty-nine Articles.

Browne, HABLOT KNIGHT, artist, the 'Phiz' of many clever and humorous book-illustrations, was born at Kennington, Surrey, 15th June 1815. He early showed a strong taste for drawing, and was apprenticed to Finden; but the laborious methods of line-engraving were little to his taste, and he took to the freer processes of etching and water-colour painting, and in 1833 gained a medal from the Society of Arts for an etching of 'John Gilpin.' In 1836 Brown succeeded Seymour and R. W. Buss as illustrator of Dickens's *Pickwick*, competing successfully against Thackeray for the work; and he soon enjoyed a reputation which was continued and preserved by his designs to numerous novels by Lever, Ainsworth, and especially Dickens. After thirty years' unceasing activity, he was struck with paralysis in 1867; he died 8th July 1882. See Life by D. C. Thomson (1884).

Browne, ROBERT, founder of the Brownists, was born about 1550 at Toletorpe, Rutlandshire, and after graduating at Cambridge in 1572, was a schoolmaster in London, and an open-air preacher. In 1580 he began to attack the order and discipline of the Established Church, and soon after formed a distinct church on congregational principles at Norwich. Committed by Bishop Freake to the custody of the sheriff, he was released through the influence of his kinsman, Lord Burghley; but in 1581, with his followers, was obliged to take refuge at Middelburg, in Holland. In 1584 he returned, *via* Scotland, to England, and reconciling himself to the Established Church, in 1586 became master of Stamford grammar-school, in 1591 rector of Achurch, Northamptonshire. Of a very violent temper, he was, when eighty years old, sent to Northampton jail for an assault on a constable, and in jail he died about 1633. The Brownists continued, notwithstanding their leader's defection, to subsist as a separate sect for some time both in Holland (among the English there) and in England. From Holland many went to America in 1670, the rest being absorbed in the Presbyterian Church in 1701; in England, they may be said to have given birth to the Independents or Congregationalists.

Browne, SIR THOMAS, author of the *Religio Medici*, was born in London, October 19, 1605, the son of a mercer of good family at Upton in Cheshire. His father died early, and his mother married again, leaving her son to the care of a rapacious guardian who seems to have made inroads upon his ward's fortune of £6000. He was educated at Winchester College and at Broadgate Hall (now

Pembroke College), Oxford, graduating B.A. in 1626 and M.A. in 1629. He next studied medicine, travelled in Ireland, France, and Italy, continued his medical studies at Montpellier and Padua, graduated as Doctor of Medicine at Leyden about 1633, and at Oxford in 1637, settling the same year at Norwich. He lived calmly throughout the troubles of the Civil War; maintained an active correspondence with some of the most learned antiquaries and scientists of his time, as Evelyn, Dugdale, Elias Ashmole, and Ray the naturalist; and was knighted by Charles II. on his visit to Norwich in 1671. He had married Dorothy Mileham in 1641, and his domestic letters that have been preserved give glimpses of a home-life of singular happiness. Of his twelve children, but one son and three daughters survived him. He died on the day on which he had completed his seventy-seventh year, 19th October 1682, and was buried in the church of St Peter's Mancroft, where his coffin was accidentally discovered by some workmen in 1840. The skull, which was well preserved, was 'knave'd out of its grave' and placed in the hospital-museum—a 'tragical abomination' that the men of Norwich might well have spared their greatest citizen.

Sir Thomas Browne's greatest work is his earliest, the *Religio Medici*, written about 1635 at Shipden Hall near Halifax, after his return from his travels, when his life was still a 'miracle of thirty years.' He tells us in the preface that it was composed 'at leisurable hours' for his 'private exercise and satisfaction,' and that 'the intention was not publick.' Two surreptitious editions published in 1642 obliged the author to issue an authorised edition in 1643. The book did not need Sir Kenelm Digby's 'observations' to make it at once famous if not popular. It was translated into Latin, and had the honour to be inserted in the *Index Expurgatorius*. Certain passages gave rise to much undeserved misrepresentation of its author's religious opinions, although, as Dr Johnson says, 'it is no difficult task to replace him among the most zealous professors of Christianity.' The book indeed is a kind of confession of faith, though it is more of a contribution to piety than to faith. It is the spiritual self-revelation of a nature of rare beauty and attractiveness, and the sympathetic reader is startled by occasional passages that reveal a depth of insight into the dim mysteries of the spiritual life that seems as unconscious as it is unexpected. 'Wingy mysteries in divinity and airy subtleties in religion' had ever a strange charm for the speculative side of Browne's intellect. He loves to abandon his mind to a full sense of the mysterious in religion. 'There are not impossibilities enough,' he says, 'in religion for an active faith. . . . I love to lose myself in a mystery, to pursue my reason to an *O altitudo!*' The book, moreover, reveals a lofty toleration for conditions of life and opinion widely different from the author's own, and a rare width of spiritual sympathy, extending even to virtuous heathens and to those ceremonies which 'misguided zeal terms superstition.' It is startling to find such a sentence as the following in a seventeenth-century writer: 'Persecution is a bad and indirect way' to plant religion. It hath been the unhappy method of angry devotion.' Unfortunately, the clear-sighted thinker was not in all points before his time. He makes avowal here of his belief in the existence of witches, and a pitiful commentary on this was his opinion given at the request of the Lord Chief-justice, Sir Matthew Hale, during the trial of two women for witchcraft at Bury St Edmunds in 1664, which doubtless helped to send the unhappy victims to their doom.

Sir Thomas Browne's next work was *Pseudo-*

doxii Epidemica, or *Enquiries into very many received tenets and commonly presumed truths, which examined prove but Vulgar and Common Errors* (1646), a strange amalgam of humour, acuteness, and credulity. Though by far the largest and most elaborate of his works, even it is entirely discursive and occasional; displaying, as it does, remarkable out-of-the-way learning, and lightened up by grave humour.

In 1658 appeared *Hydriotaphia; Urn Burial, or a Discourse of the Sepulchral Urns lately found in Norfolk*; and *The Garden of Cyrus, or the Quincuncial Lozenge, net-work Plantations of the Ancients, artificially, naturally, mystically considered*. The former is mainly an elaborate discussion of the burial-customs in various counties at various times, set in language of rich and gorgeous eloquence. The concluding chapter is a solemn homily on death and immortality. The *Garden of Cyrus* aims to show that the number five pervaded not only all the horticulture of antiquity, but that it recurs throughout all plant-life, as well as the 'figurations' of animals. All Browne's works are unsystematic and unequal; there is an unpremeditated desultoriness throughout that strikes an observant reader. His thought, no less than his style, is strikingly original, and is marked by high and occasionally transcendent intellectual power; often expressed with quaint humour or searching pathos, and always carrying with it a strange impressiveness. His favourite theme throughout all his books is ever the mystery of death and what lies beyond the grave. His style is peculiar, idiomatic, and difficult, and often falls into obscurity. He has never been equalled in the free coinage of Latinisms. No writer bears the impress of his influence more strongly than Charles Lamb. De Quincey ranked him with Jeremy Taylor as the richest and most dazzling of rhetoricians, and Lowell pronounced him 'our most imaginative mind since Shakespeare.'

There was a notable edition of Browne's works by Simon Wilkin (4 vols. 1835-36) in which appeared Dr Johnson's Life of Browne, with supplement by Wilkin; a later one by Charles Sayle (3 vols. 1904-7). Dr Greenhill's scholarly edition of the *Religio Medici* appeared in 1881, and the *Hydriotaphia* in 1896. Thomas Southwell edited *Notes and Letters on the Natural History of Norfolk, more especially on the Birds and Fishes* (1902), from Browne's MSS. in the Sloane Collection. Browne's will, and that of his father, were published by C. Williams (1906). There are bibliographies by C. Williams (1905) and G. Keynes (1924). See also E. Gosse's *Sir Thomas Browne* (1905); A. Whyte's *Sir Thomas Browne: an Appreciation* (with selections from his writings, 1898); and Walter Pater's *Appreciations* (1889).

Browne, ULYSSES MAXIMILIAN, COUNT (1705-57), born at Basel of Irish Jacobite family, became one of the foremost field-marshal in the army of Maria Theresa. As governor of Silesia (1739-42) he had to face the first of Frederick the Great's attacks, and in the Seven Years' War he commanded the Austrians at Lobositz (1756). He was mortally wounded at the battle of Prague.

Browne, WILLIAM, English pastoral poet, was born at Tavistock in 1591. He had his education at Exeter College, Oxford, was next a student at the Inner Temple, then tutor to Robert Dormer, the future Earl of Carnarvon. According to Wood he was taken into the household of the Herberts at Wilton, where he 'got wealth and purchased an estate.' But little is known of his life. He was living at Dorking about the close of 1640, and seems to have died about 1643. His great work was *Britannia's Pastorals* (books i. ii. 1613-16; reprinted 1625). Browne here shows a fine descriptive faculty, and rich poetry gleams through his quaint and tedious allegorising. A

third book was printed by the Percy Society in 1852, and by W. C. Hazlitt in his collective edition of Browne's works for the Roxburghe Club (2 vols. 1868); which includes also *The Shepherd's Pipe* (1614), a collection of eclogues, a masque produced at the Inner Temple in 1615, sonnets, and 'visions' on the model of Du Bellay. The famous epitaph 'Underneath this sable hearse,' long attributed to Ben Jonson, seems to be really Browne's. Browne, ranked by some modern critics amongst the most delightful poets of the Elizabethan period, was an admirer and imitator of Spenser. He was studied by Milton, and is significant for his influence on Keats. An edition of his poems by Goodwin was published, with introduction by Mr Bullen, in two volumes of 'The Muses' Library,' in 1904.

Brownian Movements. See BROWN (ROBERT).

Brownie, in the folklore of Scotland, a good-humoured drudging goblin; see FAIRIES.

Browning, ELIZABETH BARRETT. See BROWNING, ROBERT.

Browning, OSCAR, born in London in 1837, was educated at Eton and at King's College, Cambridge, where in 1859 he became a Fellow. In 1860-75 he was a master at Eton; from 1876 he did college and university work at Cambridge, holding amongst other posts that of university lecturer in history. He wrote much—on modern England, modern France, modern Europe, education and educational theories, Napoleon, the French Revolution, Guelphs and Ghibellines, the Condottieri, Peter the Great, Charles XII., Dante, Goethe, and George Eliot. He died in 1923.

Browning, ROBERT, a great and in any case a unique poet, one who would be a curiosity of literature even if he were not a master of it, was personally a typical product of the 19th century and of the English middle-class. He was born of a comfortable family in Camberwell (which though more rural was even then suburban) on the 7th May 1812. His father was a clerk in the Bank of England; but his father's private quality was more important than his public; he was a man of no inconsiderable learning, and the poet, his son, was brought up to feed on books. His formal education was local and trivial, but his informal education must evidently have been rich and stimulating. This can be seen even in his first publications; *Pauline*, published in 1833, is the mosaic of a rich culture. And his second book, *Paracelsus* (1835), a study of one of the strange philosophers of the more mystical Renaissance, is just such a work as no young man would write unless he had grown familiar not only with literature but with the holes and corners of literature. *Paracelsus* is a noble analysis of the too intellectual idealist; it contains passages that might be put into the mouths of the most immortal artists or philosophers; it is quite typical of Browning and his upbringing that they are put by him into the mouth of a forgotten alchemist. His next two ventures in literature illustrate his standing difficulty: which was that while his taste was as romantic as a troubadour, his instinctive mode of expression sounded as involved as trigonometry. Urged by his friend Macready, he attempted success as a dramatist; and he ought to have gained it. There never was a man more vitally dramatic than Browning; he loved above all things abrupt reversal, transitions sudden and picturesque. A meditation by Browning is more full of action than a melodrama by almost anybody else. When the fine play of *Strafford* was produced in 1837 its comparative failure was not due to anything undramatic in its spirit; it was not the stale contemporary case of a languid poet

seeking in vain to adapt himself to the activities of the stage. On the contrary, a play by Browning is rather like a play played too fast than a play played too slow. This criticism applies even more vividly to those romantic and violent plays *The Return of the Druses* and *Colombe's Birthday* and *A Blot in the 'Scutcheon'*; and applies in another way to *Pippa Passes*. There is action enough in these things; the mental and moral action is too rapid rather than too retarded. Browning, in short, had every popular gift except lucidity; love and war were all that he cared about, as they are all that mankind cares about; but he lacked some sixth wit for making his popular sympathies popular. And this he was soon to show in a form almost startling, for in 1840 appeared *Sordello*, which has passed into a sort of joke. Here we have again that note of obscure selection (*Sordello* was some troubadour to whom Dante happens to allude), but of even more obscure treatment. Fortunately he was just about to find his own final method, which he had missed in *Strafford* on the one side and *Sordello* on the other. His plays were just too clever for the audience, and his long poems were too clever for anybody; but by 1842, in the course of his settled series *Bells and Pomegranates*, he had begun to produce the very original type of poem upon which rest most of his fame and all his popularity, and which he called the 'dramatic lyric.' It was something even shorter than a short story in verse; it might almost be said to combine an epigram with a song. More exactly still it may be called a song that sharply changes its tune to take the turns of a tale. The best instances of this invention (for such it almost literally was) are *Times' Revenges*, *Youth and Art*, *Garden Fancies*, *My Last Duchess*, *Fears and Scruples*, *Instans Tyrannus*, *Confessions*, and those noble meditations *By the Fireside* and *A Toccata of Galuppi's*.

These poignant and partly grotesque poems did not appear together, but were scattered or studded like gems in the chinks of all his more ambitious work; but indeed these smaller were the precious stones, and the larger stones were sometimes a little heavy. Thus in the series published from 1841 to 1846 an ambitious historical play like *King Victor and King Charles* would appear beside a mere ballad of boot and saddle like *How they Brought the Good News from Ghent*, but there can be little doubt about which will endure. Thus in that later series called *Men and Women*, which he published in 1855, may be found elaborate, argumentative works such as *Cleon* and *Bishop Blougram's Apology*, but also *Rudel* to the *Lady of Tripoli*, and his most personal poem *One Word More*. This was addressed to the distinguished lady whom he had married in 1846, Elizabeth Barrett, the poetess, still celebrated for poetry as spirited if not as subtle as her husband's. The marriage was really a romantic elopement, such as Browning often urged and described in his poetry; and it is not impossible that if scientific criticism continues along its present lines Browning's marriage may be disproved as part of his own poems. The pair lived chiefly in Italy until Mrs Browning's death in 1861. During this period (over and above the *Men and Women* just mentioned) Browning's only important work was *Christmas Eve and Easter Day*, a fine religious poem chiefly memorable for its expression of Browning's sympathy with a simple Salvationist Protestantism as compared with the cold Protestantism of the Prussian liberalisers of theology. By tradition Browning might almost be called a Puritan, but by temper he was a romantic Puritan.

Moving to London when a widower, Browning opened that epoch of his life that revolves round his longest and in some ways his loftiest achievement. In 1864 he sent out a swarm of those abrupt,

stinging poems called dramatic lyrics under the title of *Dramatis Personæ*; they include *Abt Vogler*, *Prospice*, and several of his most influential utterances. Then occurred an interval in which he received much of his public recognition, including honorary degrees from Oxford and Cambridge; and then in 1869 came his great, one might almost say his colossal, work, *The Ring and the Book*. If it be not great as a poem it must still be considered great as a task. The very smallness of the story increases the sense of gigantic justice and gigantic exhaustion in the analysis. It is an obscure or even squalid tale of 18th century Rome retold from various points of view after the manner of a law court. The husband, the wife, and the wife's alleged lover can each in turn be represented as dubious or criminal; but the ultimate judgment pronounced by the pope shows the husband wrong, the lover pardonable, and the wife pure. It is thus like a large model of Browning's mind, it marks the exact altitude that he occupies towards the moral faiths and doubts of our epoch. He was a liberal; he recognised many points of view, and thought that they should all be urged. But he was not a sceptic in the later sense; he thought there was a truth above and beyond all aspects of it; a truth that must be declared at last. In all his works Browning looks at the truth out of innumerable windows and at innumerable angles. But he looks at it from all sides to assure himself that the truth is there; not (like the later sceptic) to be sure that it is not there, because he has seen it so often.

The Ring and the Book is Browning's high-water mark in the sense that after it his works, clever as they were, consistently exhibited the special faults of his cleverness. He threw forward the learned flank of his mind, and in *Balaustion's Adventure* (1871) and *Aristophanes's Apology* (1875), plunged into the detail of old Greek drama. *Prince Hohenstiel-Schwangau* (1872) tortuously traced the tortuous politics of Napoleon III.; *Fifine at the Fair* toyed with the fashionable doubts about free-love, and *Red Cotton Night-Cap Country* (1873) dealt with a dark story in Normandy rather as *The Ring and the Book* had dealt with a dark story in Rome. His last works of all, such as *La Saisiaz* (1878), *Jocoseria* (1883), *Ferishtah's Fancies* (1884), and *Parleyings with Certain People* (1887), were of a vivacious but miscellaneous and eccentric style; but there is something touching in the fact that *Asolando*, with its fine and famous 'one who never turned his back but marched breast-forward,' was published on the day he died in Venice, the 12th of December 1889.

Browning's unpopularity as a poet, though grossly exaggerated, does spring from two real roots: one the fault of himself and the other of his admirers. His involved form of expression was undoubtedly used in places where he could plead no excuse even of subtlety; but his followers have further obscured him by attaching a pompous intellectual importance to things which he designed (even if unsuccessfully) to be light. Of the intellectuality of Browning's philosophy too much has perhaps been made. Oddly enough, his most sincere philosophy was quite the reverse of intellectual; it was the praise of mere instinct or even of mere passion. His theory of life, if it errs, certainly errs on the side of a dangerous invitation to each man to follow his heart's desire; and if he was an optimist it was only as almost any healthy man is an optimist.

A fault in Browning far more fatal to literature than his obscurity is a certain verbal frivolity which makes him mar plain passages with jests that are not worth making and tricks that are

nothing when achieved. Of this sort are his puns on Wiseman, Newman, and Manning; of this sort are his crazily clever and cacophonous rhymes. Thus in *Old Pictures in Florence* he is urging his favourite ideal of mortal imperfection pointing to immortal perfection, of mortal perfection as something inferior to either, he writes:

Thyself shalt afford the example, Giotto!
Thy one work, not to increase or diminish,
Done at a stroke, was just ('was it not?') 'O!
Thy great Campanile is still to finish.

Nobody need ask for a wittier or more poetic figure of speech for great failure and small achievement than this comparison between the perfect circle and the imperfect tower. But Browning must spoil a simple and beautiful effect for the sake of making a bad rhyme to Giotto. This is not in the least obscurity; it is simply ugliness.

It is by his dramatic lyrics that he stands out most picturesquely, and their most fascinating element is their union of wild humour with high and hard thought. It is a rare achievement to mould a medium in which the sublime and the grotesque may melt naturally into each other; it has been done, but not often. The decoration of the Gothic did it; and the rambling style of Rabelais and the irony of Ariosto. In English it has seldom been done so strongly and naturally as in two such verses as these, from the lyric called *Shop* in which Browning pleads for an amateurishness which enlarges life:

I want to know a butcher paints,
A baker rhymes for his pursuit,
Candlestick-maker much acquants
His soul with song, or, haply mute,
Blows out his brains upon the flute!
But—shop each day and all day long!
Friend, your good angel slept, your star
Suffered eclipse, fate did you wrong!
From where these sorts of treasures are
There should our hearts be—Christ, how far!

These few lines begin with images as broadly comic as a page in *Punch* and they end with a cry as of a saint. Yet the whole moves as naturally as the curl of a great gray gargoyle rises from a goggle-eyed dragon to the garments of the Mother of God.

Finally, these slighter poems of Browning are a turning-point and an inspiration because they gave a fresh and brisk renewal to the profound realism of love-poetry. Love, like all divine things, is sacramental and corporeal; and love-poetry had always concentrated upon material shapes and symbols, special trysting-places, or true lovers' knots. But there had long been a tendency to report these realistic emotions under types too abstract or antiquated. In reading some of the genuine melodies of Byron and of Moore one might fancy that there were no other flowers in the world but roses, and that all important events took place by moonlight. Browning poured into love-poetry a flood of the real facts and circumstances of lovers, unexpected pathways, opening windows, chance sights, and changing weather.

Two fields to cross ere a farm appears,
A tap on the pane; the short, quick scratch,
And blue spurt of a lighted match.

It is that unquestionable match that will be still burning when most of Browning's larger lamps of controversy and learning have burned low.

[See Browning's *Life and Letters*, by Mrs Sutherland Orr, revised and partly rewritten by F. G. Kenyon (1908); with books on him by Symons (1887), Fotheringham (1887), Gosse (1890), Sharp (1890), Hiram Corson (1892), Waugh (1900), Stopford Brooke (1902), Dowden (1904), Herford (1905), Griffin and Minchin (1910), and Mr Chesterton (1903), the writer of the above article; Santayana's *Poetry and Religion* (1900); the *Browning Society's Papers*, Furnivall's *Browning Bibliography*, Mrs Sutherland Orr's *Handbook to Browning* (1886); the

bibliography by Wise in Nicoll and Wise's *Literary Anecdotes of the Nineteenth Century* (1895); Mme. Duclaux's *Grands Écrivains d'Outre-Manche* (1901); and the letters mentioned below. A uniform edition of his works (17 vols.) appeared in 1888-90, a two-vol. edition in 1896, and the Centenary Edition (10 vols.) in 1912.]

His wife, ELIZABETH BARRETT BROWNING, a famous English poetess, was born at Coxhoe Hall, Durham, 6th March 1806. Her father, Edward Moulton, assumed the surname of Barrett on succeeding to estates in Jamaica; and the family afterwards settled at Hope End, near Ledbury, in Herefordshire. Her extraordinary talents were very early developed. At ten she was able to read Homer in the original, and at fourteen years of age she wrote an epic on *The Battle of Marathon*. About 1824 she seriously injured her spine through an accident in saddling her horse; and she was compelled for a long time to remain in a recumbent position. After her mother's death the family went to Sidmouth, and subsequently settled in London. Her *Essay on Mind, and other Poems*, published when she was nineteen years of age, was succeeded by *The Seraphim, and other Poems* (1838), in which volume was republished the fine poem on Cowper's grave. Shortly after this time she was taken to Torquay for the benefit of her health, and during her stay took place the tragic incident which 'gave a nightmare to her life for ever;' her brother Edward, with some friends, was drowned in Babbicombe Bay. Even after her return to her father's town residence in Gloucester Place she remained for years an invalid confined to the sickroom; but her literary bent was warmly fostered by her relative, Mr Kenyon. In 1844 appeared the *Poems* which contained *The Cry of the Children*, a noble outburst over the wrongs of young children employed in factories. Early in 1846 she first saw Robert Browning, whom she had admired as a poet. The two were married in the following autumn, and in consequence of her fragile health Browning immediately took his wife abroad. Another volume by her appeared in 1850, containing new poems, and a translation of the *Prometheus Bound* of Æschylus, which testified to the learning as well as the genius of the translator. The Brownings settled in Florence, where, in 1849, a son was born, Robert Barrett Browning (d. 1912), who became a sculptor. Mrs Browning was described, in 1851, as 'the soul of fire inclosed in a shell of pearl.' She wrote her poem *Casa Guidi Windows*, in which she expressed her earnest sympathy with the movement for the regeneration of Italy. *Aurora Leigh*, published in 1856, the authoress described as 'the most mature of my works, the one into which my highest convictions of work and art have entered.' In *Poems before Congress* (1860) she again manifested her interest in the development of Italian freedom. Browning's *Mr Sludge, the Medium*, is interesting because it represents Browning's side in a controversy which raged between him and his wife; perhaps their only serious difference. If it was her vanity to be mystical, it was his to be manly, and he chose to see in the experiments of Home the medium the incurable mendacities of a parasite. Even here, however, he remembers his own mysticism; and the poem ends with a spirited outburst by the medium that 'there is something in it, tricks and all.' She died at Florence, 30th June 1861. In 1862 her *Last Poems* were published by her husband. Her *Greek Christian Poets and the English Poets* (1863) consisted of prose essays and translations. Her diction was at times splendidly fervid; but neither fervour nor knowledge of Greek saved her from the most distressing faults of form, barbarous rhymes, slipshod rhythms, and general diffuseness. Her *Sonnets from the Portuguese* have no connection

with Portugal or the Portuguese, but are wholly her own noble love-poems. As poets, few of her sex approach her in strength, imagination, and knowledge; and her letters also were full of poetic fancy and spiritual insight.

See above article and works cited at the end; the letters that passed between her and Browning (1899), and other collections of her letters (1876 and 1897); the *Life* of her by Ingram (1889); and the French monograph by Merlette (1905).

Brownists. See BROWNE, ROBERT.

Brown-Séguard, ÉDOUARD (1817-94), physiologist and physician, was born in Mauritius, his father being a sea-captain from Philadelphia, U.S., who married on the island a lady called Séguard. The son studied at Paris, and devoting himself especially to physiological research on blood, muscular irritability, animal heat, the spinal cord, and the nervous system. In 1864 he became professor at Harvard, but in 1869 returned to a chair in Paris. In 1873-75 he was a medical practitioner in New York, treating specially diseases of the nervous system; and finally succeeded Claude Bernard as professor of Experimental Medicine at the Collège de France. He published lectures on the physiology and pathology of the nervous system (1860), on paralysis of the lower extremities (1860), on nervous affections (1873), and on the dual character of the brain.

Brownson, ORESTES AUGUSTUS (1803-76), a versatile American writer, born at Stockbridge, Vermont. In turn a Presbyterian, a Universalist, and next a Unitarian pastor, in 1844 he found rest in the Roman Catholic communion. Throughout his life he wrote with ability and warmth in defence of his opinions at the time, and took an active interest in social and political questions. His most important work was published in the *Boston Quarterly Review*, and afterwards in *Brownson's Review*. Among his books are *Charles Elwood, or the Infidel Converted* (1840), *The Spirit-rapper* (1854), and *The Convert* (1857), all with a good deal of autobiographic interest; also *The American Republic* (1865).

Brown Spar. See DOLOMITE.

Brownsville, a port of Texas, on the north bank of the Rio Grande, opposite Matamoros, about 35 miles from the Gulf of Mexico; pop. 12,000.

Broxburn, in Linlithgowshire, on the Union Canal, 12 miles W. of Edinburgh, has great oil-shale pits and paraffin works.

Bruce, the surname of a family illustrious in Scottish history, descended from Robert de Bruis, a Norman knight, who accompanied William the Conqueror to England in 1066. The name, which is undoubtedly territorial, can probably be traced to the lands and castles of Bruis, near Cherbourg in Normandy. The first Robert de Bruis received extensive lands chiefly in Yorkshire. His son, the second Robert, was a companion in arms of Prince David of Scotland, afterwards David I., from whom he received a grant of the lordship of Annandale. At the commencement of the war in England between Stephen and Matilda, niece of the king of Scots, Robert de Bruis adhered to the former, and renounced his allegiance to David, resigning his lands in Annandale to his son Robert. In 1138 he was sent by the barons of the north of England to negotiate with David, who had advanced in support of his niece's claims as far as Northallerton, Yorkshire. In the battle of the Standard which followed, tradition relates that he took prisoner his son Robert, then fourteen years of age, who, as lord of Annandale, fought on the Scottish side. He died in 1141. His English estates were inherited by his eldest son, Adam, whose male line terminated in

Peter Bruce of Skelton, Constable of Scarborough Castle in 1271. Robert Bruce, second lord of Annandale, had two sons: Robert—who married a natural daughter of William the Lion, and died, without issue, before 1191—and William, whose son, Robert, fourth lord of Annandale, married Isabel, second daughter of David, Earl of Huntingdon and Chester, brother of William the Lion, and thus laid the foundation of the royal House of Bruce. He died in 1245.

ROBERT DE BRUCE, fifth lord of Annandale, son of the fourth lord above mentioned, and the competitor with John Baliol for the crown of Scotland, was born in 1210. On the death of his mother, the Princess Isabel, in 1251, he did homage to Henry III. for her lands in England, and in 1255 was made Sheriff of Cumberland, and Constable of the castle of Carlisle. About the same time he was appointed one of the fifteen regents of Scotland during the minority of Alexander III. In 1264 he led, with Comyn and Baliol, the Scottish auxiliaries to the assistance of the English monarch at the battle of Lewes, where he was taken prisoner, but released after the battle of Evesham, the following year. On the Scottish throne becoming vacant at the death, in 1290, of Margaret, the 'Maid of Norway,' granddaughter of Alexander III., Baliol and Bruce claimed the succession, the former as great-grandson of David, Earl of Huntingdon, by his eldest daughter, Margaret; the latter as grandson, by his second daughter, Isabel. Edward I. of England, to whom the dispute was referred, decided in favour of Baliol in 1292. To avoid swearing fealty to his successful rival, Bruce resigned Annandale to his eldest son, Robert Bruce, Earl of Carrick. He died at his castle of Lochmaben, Dumfriesshire, in 1295, leaving three sons and a daughter.

ROBERT DE BRUCE, Earl of Carrick, eldest son of the preceding, is said to have accompanied King Edward I. of England to Palestine in 1269, and was ever after greatly esteemed by that monarch. On his return to Scotland, he married, in 1271, Marjory, Countess of Carrick, and in her right became Earl of Carrick. In 1292 he resigned the earldom of Carrick to his eldest son, Robert, the future king of Scotland, then a minor. On the death of his father in 1295 he did homage to Edward for his English lands, and was appointed keeper of the castle of Carlisle, and in the following year, when Baliol renounced the authority of Edward, Bruce fought on the side of the English. After the battle of Dunbar, in which the Scots were defeated, and Baliol compelled to relinquish the sovereignty, he made application to Edward for the vacant crown, but was refused it. He afterwards went to live on his English estates, where he died in 1304.

ROBERT BRUCE, the most heroic of the Scottish kings, eldest son of the preceding, was born in 1274. In his youth he favoured the English interests, in the expectation, doubtless, of his father being preferred to the Scottish throne. In 1296, as Earl of Carrick, he swore fealty to Edward I. at Berwick, and the following year he renewed his oath of homage at Carlisle. Shortly after, he abandoned the cause of Edward, and with his Carrick vassals joined the Scottish revolt under Wallace. By the Capitulation of Irvine, however, Bruce speedily made his peace with the English monarch. In 1298, the year of the Scottish defeat at Falkirk, Bruce again rose against Edward. He had his lands wasted by the English, and he burned the town of Ayr. But Edward did not proceed to extremities against him. Though Bruce was one of the four regents of Scotland in 1299, he did not again fight against Edward till the final rising in 1306. But while publicly an adherent of the English king, Bruce had entered into

a secret alliance with Lamberton, Bishop of St Andrews, one of the most patriotic of the Scottish clergy. The decisive step was taken by the murder of Comyn at Dumfries. With John Comyn, called the Red Comyn, the nephew of Baliol, he seems to have entered into some agreement as to their rival claims to the throne. They met in the church of the Minorite Friars, Dumfries (10th February 1306); a quarrel took place; and Bruce, in a paroxysm of passion, stabbed Comyn with his dagger. Rushing out to his attendants, he is said to have exclaimed: 'I must be off, for I doubt I have slain the Red Comyn.' 'Doubt!' cried Kirkpartick of Closeburn: 'I mak sikker!' (i.e. sure), and running into the church, despatched Comyn.

The motives and circumstances that led Bruce to the murder of Comyn are not quite clear, but the die was now cast. Bruce hastened to Lochmaben Castle, assembled his vassals, and asserted his right to the throne. Two months later, he was crowned king at Scone. An English army, under the Earl of Pembroke, nominated by Edward governor of Scotland, took possession of Perth, and surprised Bruce in the wood of Methven, compelling him to retreat into the wilds of Athole. At Dalry, near the head of Loch Tay, Bruce was attacked by Alexander, Lord of Lorn, chief of the Macdougals, the Red Comyn's uncle, and compelled to retire. Sending his queen and her ladies to Kildrummie Castle, Aberdeenshire, under the charge of Nigel Bruce and the Earl of Athole, Bruce continued his wanderings in the West Highlands, and then took refuge in the little island of Rathlin, on the north coast of Ireland, where he remained all winter, supposed to be dead. In his absence, the English took the castle of Kildrummie, hanged Nigel Bruce and other chiefs who had defended it, and tore the queen and Princess Marjory from the sanctuary of St Duthac, at Tain. All Bruce's estates were confiscated, and himself and adherents excommunicated by the pope's legate at Carlisle. In the spring of 1307 Bruce landed in Carrick, and at midnight surprised the English garrison in his own castle of Turnberry; but before a superior force he retired into the mountainous districts of Ayrshire. At Loudon Hill in the same year he defeated the English under the Earl of Pembroke.

The death of King Edward in 1307 was the turning-point in the struggle of Bruce. In the following years the English were cleared out of the country and all the great castles recovered, with the exception of that of Stirling. It too was closely pressed by Edward Bruce, who entered into an arrangement with the governor, Sir Philip Mowbray, by which the latter bound himself to surrender it, if not relieved before 24th June following. This led to the memorable battle of Bannockburn (q.v.), 24th June 1314. The English, under Edward II., amounting, it is said, to about 100,000 men, were totally routed by Bruce with an army less than one-third that number. In 1317 Bruce passed over to Ireland to assist his brother Edward, elected king of that country, and defeated the Anglo-Irish at Slane, in Louth. In the year after Bannockburn the Scots repeatedly invaded England, taking the town of Berwick in 1318. The truce of 1323 for some time put a stop to the struggle; but on the accession of Edward III. in 1327 hostilities recommenced with a great Scottish inroad into the northern counties. The war was at last closed by the Treaty of Northampton (1328), recognising the independence of Scotland, and Bruce's right to the throne. His warfare was now accomplished, and suffering under the disease of leprosy, he spent the last two years of his life at Cardross Castle, on the northern shore of the Firth of Clyde. He died in

1329 in his fifty-fifth year, and the twenty-third of his reign. His heart, extracted and embalmed, was delivered to Sir James Douglas, to be carried to Palestine and buried in Jerusalem. Douglas was killed fighting against the Moors in Spain, and the sacred relic of Bruce, with the body of its devoted champion, was brought to Scotland, and buried in the monastery of Melrose. Bruce's body was interred in the Abbey Church of Dunfermline; and, in clearing the foundations for a third church on the same spot in 1818, his bones were discovered. He was twice married: (1) to Isabella, daughter of Donald, tenth Earl of Mar—issue, a daughter, Marjory, wife of Walter the High Steward, whose son ascended the throne as Robert II.; and (2) to Elizabeth, daughter of Aymer de Burgh, Earl of Ulster—issue, one son, who succeeded him as David II. (q.v.), and two daughters.

EDWARD BRUCE, king of Ireland, brother to the above, a chivalrous but rash and impetuous prince, was actively engaged in the struggle for Scotland's independence; and in 1308, after defeating the English twice, made himself master of Galloway. In 1315 the chieftains of Ulster tendered to him the crown of Ireland on condition of his assisting them to expel the English. With 6000 men he embarked at Ayr, and reached Carrickfergus in that year, accompanied by Sir Thomas Randolph, Earl of Moray, and other Scottish knights of renown. Soon he was master of Ulster, was crowned king of Ireland in 1316, but was slain at the battle of Dundalk in 1318.

Bruce, JAMES, 'the Abyssinian,' was born at Kinnaird House, Stirlingshire, 14th December 1730. Having studied at Harrow, and at the university of Edinburgh with a view to a legal career, he proceeded to London, married in 1756 the daughter of a wine-merchant's widow, and became for some years a partner in the business. In 1763-65 he was consul-general at Algiers, where he studied oriental languages and acquired the rudiments of surgery. His medical studies he subsequently continued at Aleppo, and resolved to travel in the character of a physician. In June 1768, he proceeded to Alexandria, and from Cairo set out on his famous journey to Abyssinia. Sailing up the Nile to Syene, he crossed the desert to Cosseir, and arrived at Jeddah in April 1769. Gondar, the capital of Abyssinia, he made in February 1770; and on 14th November of that year, succeeded in reaching the sources of the Abawi, then considered the main stream of the Nile. He returned by way of Sennaar and the desert of Assuan, after great hardship reaching Alexandria, whence he embarked (March 1773) for Marseilles. In France he visited Buffon and other savants, and in 1774 returned to Scotland. His long-expected *Travels to Discover the Sources of the Nile, in the Years 1768-73*, appeared in 1790, in five large quarto vols., with plates and charts. So curious were many of the narrations that by some—as by Dr Johnson—they were set down as fabrications. Modern travellers, including Pearce, Burckhardt, Belzoni, and others, have, however, testified to Bruce's general accuracy. He died, 27th April 1794, at Kinnaird, of a fall down stairs.

Bruce, JOHN COLLINGWOOD, antiquary, born at Newcastle in 1805, graduated at Glasgow in 1826, and was trained for the Presbyterian ministry, but devoted himself to teaching. He was Moderator of the English Presbyterian Church in 1881. His works include *The Roman Wall* (1851; 3d ed. 1866); *The Bayeux Tapestry Elucidated* (1856); *Lapidarium Septentrionale* (1875), an account of all the Roman monuments in the north of England; and a *Handbook to the Roman Wall* (1863; 3d ed. 1885). He died 5th April 1892.

Bruce, MICHAEL, Scottish poet, was born 27th March 1746, at Kinnesswood, near the eastern

shore of Loch Leven. A weaver's son, he tended sheep in his boyhood, but in 1762 was sent to Edinburgh University to study for the ministry. He had all his life to struggle with poverty; and after he left the university in 1765, and settled as a schoolmaster, first at Gairney Bridge, then near Tillicoultry, to poverty were added sickness and melancholy. He died of consumption, 5th July 1767, aged twenty-one. His tender and pathetic *Poems on Several Occasions*, seventeen in number, were published by the Rev. John Logan, his college friend, in 1770. The authorship of the *Ode to the Cuckoo*, and of some of his hymns, has proved a vexed question of literary controversy, Logan having been charged with appropriating poems by Bruce, and publishing them as his own. Logan's claim is defended by David Laing and J. Small (1873-78), Bruce's by Mackelvie (1837), Grosart (1865-86), and Mackenzie (1905).

Bruce, STANLEY MELBOURNE, Australian statesman, was born in 1884. Educated at Melbourne Grammar School and at Trinity Hall, Cambridge, he subsequently found a career in business. Entering politics in 1918, in 1921 he became treasurer in Hughes's Nationalist administration, representing Australia at the assembly of the League of Nations the same year. In 1923, following Hughes's defeat at the polls in December 1922, he became premier in a Nationalist Country Party administration, established in the interests of stable government after Hughes, as a necessary preliminary to coalition, had resigned his claims to the premiership. He has advocated imperial preference, and the right of the dominions to participate in the formulation of a common imperial foreign policy.

Bruce, WILLIAM SPEIRS (1867-1921), zoologist, oceanographer, and explorer, born in London, studied at Edinburgh. In 1892 he went in a whaler to the Antarctic; and thereafter he devoted his life to Polar exploration, his voyage in the *Scotia* to the Wedell Sea (1902-4) and his researches at Spitsbergen being especially noteworthy. See POLAR EXPLORATION; R. N. Rudmose-Blown, *A Naturalist at the Poles* (1923).

Brucea, a genus of Simarubaceæ (q.v.) named after 'Abyssinian' Bruce. The leaves are bitter, astringent, and tonic, like those of *Quassia* (q.v.).

Bruch, MAX (1838-1920), an eminent composer, was born of Jewish parents at Cologne, and from 1870 lived mainly at Berlin and Bonn. In 1880-83 he was conductor of the Liverpool Philharmonic Society. He is specially famous for his epic cantatas (*Frithiof*, *Salamis*, *Normannenzug*), his orchestral music (especially the scenes from *Frithiof's Saga*), his operas *Die Jungfrau von Orleans* and *Hermoine*, and his violin concertos.

Bruchsal, a town of Baden, on the Saalbach, 12 miles N.E. of Karlsruhe. The Old Town, around which are four suburbs, contains the castle of the prince-bishops of Speyer, who resided here from the 16th century, and whose ancient tombs are pointed out in the church of St Peter. Machinery, cigars, and paper are made, and there is an active trade in hops, tobacco, and corn. Pop. 15,000.

Brucine is one of the Alkaloids (q.v.) present in *Strychnos Nux Vomica*, and *St Ignatius' bean*, along with strychnine, &c. In action it resembles strychnine, but is only about one-twelfth of its strength. It is mainly characterised by giving a blood-red colour with concentrated commercial nitric acid; indeed, the red colour always yielded by *nux vomica*, and occasionally by strychnine, when treated with nitric acid, is due to the presence of brucine. Brucine can be converted into strychnine by heating with five times its weight of dilute nitric acid, carbon dioxide being given off.

Bruck, (1) a walled town of Lower Austria, dating from the 3d century, on the left bank of the Leitha, 24 miles SE. of Vienna, with a princely castle; pop. 5000.—(2) A town of Austria (Styria), on the Mur, 25 miles NNW. of Graz, with iron-works, &c.; pop. 7000.—(3) A market-town of Bavaria, 15 miles W. of Munich, with the buildings of a Cistercian monastery, founded in 1266; pop. 5000.

Brückenau, a small town of Bavaria, on the Sinn, 17 miles NW. of Kissingen. The baths are picturesquely situated in the valley, about 2 miles off. The three warm springs are chiefly of use in nervous and cutaneous diseases.

Brucker, JOHANN JAKOB (1696-1770), historian and biographer, born at Augsburg, studied at Jena, and became pastor at Augsburg. A laborious and voluminous writer, he is chiefly remembered by his *Historia Critica Philosophæ* (5 vols. 1742-44; new ed. 1767).

Bruckner, ANTON, composer, was born at Ansfelden, Upper Austria, 24th September 1824, played the organ, taught in Vienna conservatorium and university, and died in Vienna, 11th October 1896. A strong Wagnerian, he composed nine symphonies (the last incomplete) and some masses.

Brueghel. See BREUGHEL.

Bruges (Flem. *Brugge*, so called from its many bridges), a city of Belgium, capital of the province of West Flanders, is situated in a fertile plain about 8 miles from the sea, with which it is connected by the three canals from Ghent, Sluys, and Ostend, besides the great ship-canal to Zeebrugge. The inhabitants depend, nevertheless, for their supply of water principally upon rain-water, which is collected in large cisterns, public and private. The ramparts form an agreeable promenade, and the streets have a venerable and picturesque yet deserted aspect, the population being now scarcely a quarter of what it was during the middle ages. Among the most interesting buildings are Les Halles (1364), a museum and market, with the famous Belfry (q.v.); the Gothic hôtel-de-ville (1377, restored 1895); the Chapel of the Holy Blood; the church of Notre Dame, with a spire 442 feet high, many valuable paintings, exquisite wood-carvings, a statue of the Virgin (said to be by Michelangelo), and monuments of Charles the Bold and his daughter Mary, wife of the Emperor Maximilian; the cathedral of St Sauveur, with an ugly brick exterior, but a fine interior, containing the stalls of the knights of the Golden Fleece (q.v.); and St John's Hospital, with Hans Memlinc's masterpieces adorning the reliquary of St Ursula's arm. Bruges has manufactures of lace, woollens, linen, cotton, leather, soap, starch, and tobacco; and distilleries, sugar and salt refineries, and shipbuilding-yards. Of late its position on railways and canals has partly restored its commercial importance, a ship-canal to Zeebrugge (q.v.; 'Bruges-on-Sea') having been opened in 1905. The population is about 54,000—many of them in extreme poverty, the excellent charitable institutions being accordingly heavily taxed. Dating from the 3d century, Bruges by 1200 was the central mart of the Hanseatic League; and a hundred years later it may be said to have become the metropolis of the world's commerce. Commercial agents from seventeen different kingdoms resided here, and no less than twenty ministers from foreign courts had mansions within its walls. Its population at this time amounted to upwards of 200,000. In 1488 the citizens rose in insurrection, and imprisoned the Archduke Maximilian, and with the harsh measures of repression which ensued commenced the commercial decline of Bruges. Many

of the traders and manufacturers, driven forth from their own country by the religious persecutions of the following century, settled in England, and brought with them their manufacturing superiority. In the 16th century, however, the tapestry of Bruges was still celebrated. Taken by the French in 1794, in 1815 the city became a part of the kingdom of the United Netherlands, and in 1830 of the Belgian monarchy. It was held by the Germans in 1914-18. Bruges was the home of Memlinc and Pourbus and Stevinus, and of Jan van Eyck for a time; Caxton was here in 1446-70.

Brugg, a town in the Swiss canton of Aargau, on the right bank of the Aar, 36 miles ESE. of Basel. It was the cradle of the House of Hapsburg, whose ruined castle, founded in 1020, crowns a wooded height near. In the vaults of the abbey of Königsfelden (1310; now an asylum) are interred many of the members of the family. Zimmermann was a native. Pop. 4000.

Brugge. See BRUGES.

Brugmann, FRIEDRICH KARL (1849-1919), comparative philologist, was born at Wiesbaden. He studied at Halle and Leipzig, and after teaching in Wiesbaden and Leipzig became professor of Comparative Philology at Freiburg (1884) and Leipzig (1887). With Osthoff, his fellow-leader of the Junggrammatiker School, he wrote *Morphologische Untersuchungen auf dem Gebiet der indogermanischen Sprachen* (1878-89), in which the fixity of the laws of sound-change and the importance of analogy in the history of language were maintained. A contribution to Curtius's *Studien zur griechischen und lateinischen Grammatik* (1897) led to an embittered dispute with that scholar. Brugmann's great work is the epoch-making *Grundriss des vergleichenden Grammatik der indogermanischen Sprachen* (1886-1900), with additional volumes by Delbrück. He was joint editor of the *Indogermanische Forschungen*.

Brugsch, HEINRICH KARL (1827-94), Egyptologist, born at Berlin, took part in 1853 in Mariette's excavations at Memphis. He was called to the chair of Oriental Languages at Göttingen, but returned to Egypt in 1870 as head of the School of Egyptology at Cairo with the rank of bey, becoming pasha in 1881. Brugsch's numerous and valuable works include dictionaries and works on grammar, inscriptions, history, geography, and religion. See his *Mein Leben und mein Wandern* (1894).

Brühl, a town of Rheinland, 8 miles SSW. of Cologne by rail. It has a splendid castle, erected in the early part of the 18th century by the Elector Clement Augustus of Bavaria, and restored by the king of Prussia in 1842. After his banishment from France in 1651, Cardinal Mazarin took up his residence in Brühl. Pop. 8000.

Brühl, HEINRICH, COUNT VON, prime-minister of Augustus III., king of Poland and Elector of Saxony, memorable among unworthy ministers and venal statesmen. He was born in 1700 at Weissenfels, and in early life entered, as a page, into the service of the Duchess of Saxe-Weissenfels. His winning address and tact gained for him rapid promotion through several offices of state, until, in 1746, he became prime-minister to that idle and unpatriotic ruler, Augustus III. With the basest and most slavish sycophancy, he humoured the whims of his unworthy master, draining the coffers of the state, and burdening the country with debt, to supply him with money to squander on his follies. Yet he contrived to enrich himself, and to accumulate honours and titles. He kept a horde of servants, and maintained the most splendid establishment in the kingdom. The effect of his reckless robbery of the national finances made itself felt at the outbreak of the Seven Years' War,

when the country could furnish only 17,000 men to oppose Frederick of Prussia, who surprised and captured the whole Saxon army in its camp at Pirna. Augustus and Brühl fled to Warsaw. When peace was concluded, they returned to Dresden, where Augustus died on the 5th October 1763. His worthless parasite had the grace to follow him three weeks later (28th October).

Bruise, or **CONTUSION**, signifies an injury inflicted by a blow or sudden pressure, in which the skin is not wounded, and no bone is broken or dislocated. Both terms, and especially the latter, are employed in surgery to include all such injuries in their widest range, from a black eye to a thoroughly crushed mass of muscle. In the slighter forms of this injury, as in ordinary simple bruises, there is no tearing, but only a concussion of the textures, the utmost damage done being the rupture of a few small blood-vessels, which occasions the discoloration that is always observed in these cases. In more severe contusions, the subjacent structures—muscles, connective tissue, vessels, &c.—are more or less ruptured, and in extreme cases, are thoroughly crushed, and usually become gangrenous. The quantity of blood that is extravasated mainly depends upon the size and number of the ruptured blood-vessels, but partly also on the nature of the textures of the injured part. Thus, a lax tissue, as that of the eyelids, favours the escape of blood into the surrounding parts. Moreover, the constitution of the patient has some influence, and many persons, especially, according to Paget, pallid, fatty, soft-skinned women, though suffering from no apparent disease, as well as those affected with scurvy or with the 'hemorrhagic diathesis' (see **HÆMOPHILIA**), are subject to extravasations, and consequently to discolorations, very disproportionate to the injuries that cause them.

The most characteristic signs of a recent contusion are more or less Shock (q.v.), pain, swelling, and discoloration of the surface from effused blood (commonly known as *Echymosis*, q.v.). There is nothing special in the character of the shock, but it is worthy of notice that it is most severely felt in injuries of special parts—as the testes, the breasts, and the larger joints, which are often followed by remarkable general depression, faintness, loss of muscular power, and nausea. The immediate pain following the blow is succeeded by a feeling of numbness, which, after a varying time, unless the part is killed, gives place to a heavy, aching pain. Although some depression may usually be observed immediately after the infliction of the blow, swelling of the parts rapidly follows, as may be well seen when a child receives a blow on the head, or in the wale that rises after the lash of a whip. In lax parts, such as the eyelids, the swelling is often considerable, and may remain for a week or more; but in other parts it usually subsides in two or three days. The discoloration of the skin consequent on blows is of a more or less purple tint, varying from black to crimson or pink. 'Blackness,' says Paget, 'usually indicating intense injury, is probably due to the extravasation of a large proportion of entire blood; crimson or pink tints, to the prevalence of a blood-stained fluid; blue, to the degrees in which blackness is veiled by the cuticle and skin, as the colour of blood in veins is; and perhaps some of the shades of pink to the partial aeration of the blood by the penetration of air through the epidermis. After a variable time, proportionate to the severity of the injury, these colours fade out, passing most commonly through gradually lightening shades of brownish olive, green, and yellow.' The causes of these changes of colour are not clearly known; as, however, the changes are not observed in bruises

of parts removed from air and light, they are probably due to oxidation and actinic agency. When a severe bruise tends to a natural cure, and there is no inflammation or sloughing, the effused blood is generally absorbed, the liquid portion rapidly disappearing, while the blood-cells are more slowly removed. In some cases, it is possible that the effused blood may become organised into vascular connective tissue, which takes part in the repair of the injured tissue. We need not follow the course of a bruise in which active inflammation with suppuration ensues, or in which sloughing takes place, as these complications must be treated according to the ordinary rules for those affections. There are, however, one or two ill consequences following partial recovery, which require notice. Thus, in some organs, as the breast, abscess may ensue long after a blow; or a sensitive indurated lump may remain; or (more commonly) there may be long-continued pain, without change of texture; or, lastly, cancer may ensue. Blows on superficial bones, as those on the skull, are not unfrequently followed by very painful thickening of the periosteum; a muscle violently struck may be paralysed, and rapidly waste away; and constitutional diseases, such as gout and rheumatism, are well known to localise themselves with special severity in parts that have once been seriously bruised.

With regard to treatment, simple and not very severe bruises require little treatment but the rest necessary for the avoidance of pain; but the removal of the swelling and discoloration may be hastened by the application of various local stimulants, which seem to act by accelerating the circulation through the bruised part, and promoting the absorption of the effused fluid. Friar's balsam, compound soap liniment, or poultices made with the roots of black bryony beaten to a pulp, are popular remedies of this class. Tincture of arnica has a great reputation; but experiments have made it very doubtful whether it is any more efficacious than simple spirit of the same strength. A solution of sulphurous acid, and hazeline and other preparations of the American Witch-hazel (q.v.) are of more value. They should be kept constantly applied to the bruised part on lint or cotton-wool. Pugilists, who are probably better acquainted with ordinary bruises than any other class of men, are in the habit of removing the swelling of the eyelids that often naturally occurs during a prize-fight to such an extent as to close the eyes, by at once puncturing the eyelids at several points with a lancet; and their favourite remedy for a black eye or other bruise on the face is a fresh beefsteak applied locally as a poultice. Severe bruises must at once be placed in the hands of a surgeon.

Brülov (or **BRYLOF**), **CONSTANTINE PAVLOVICH** (1799–1852), a great Russian historical, religious, and portrait painter, born at Petersburg.

Brumaire (Fr., 'foggy month'), a division of the year in the republican calendar of France. It includes the time from October 22 to November 20. The celebrated 18th Brumaire, which witnessed the overthrow of the Directory (q.v.) and the establishment of the sway of Napoleon, corresponds with November 9, 1799, of the Gregorian calendar.

Brummell, **GEORGE BRYAN**, better known as 'Beau Brummell,' was born in London, 7th June 1778, the son of Lord North's private secretary, and grandson of a gentleman's gentleman. At Eton, and during a brief sojourn at Oxford, he was less distinguished for studiousness than for the exquisiteness of his dress and manners; and after four years in the army, having come into a fortune of £30,000, he entered society on his true vocation of arbiter of elegancies. His success was brilliant;

but the pace was too hot, and his wit was, moreover, too fine for his twenty years' patron and admirer, the Prince Regent. They quarrelled in 1813, and gambling debts three years later forced Brummell to flee to Calais. He struggled on there, reckless as before, for fourteen years; from 1830 to 1832 held a sinecure consulate at Caen; and, after three years of drivelling imbecility, died in the pauper lunatic asylum of that city, 30th March 1840. See *Lives* by Jesse (1844; new ed. 1886), Boutet de Monvel (1908), and Lewis Melville (1925).

Brunai, or **BRUNEL**, a British protectorate in the NW. of Borneo, till 1888 nominally an independent Mohammedan territory, whose sultan was formerly overlord of the whole island; since 1906 administered by a British Resident. Pop. 25,000, divided into trade castes. The capital, Brunai, on a river of the same name, is a miserable, dirty town, built on piles. The trade is small, the chief exports being cutch, coal, and rubber. See **BORNEO**.

Brunanburh, the scene in 937 of a bloody battle, in which Athelstan (q.v.) defeated an allied army of Welsh, Scots, and Danes, variously placed in Lothian, Northumberland, Yorkshire, Lancashire (south of Pieston or at Burnley), near Axminster in Devon, at Bumbly in Lincolnshire, at Bromborough in Cheshire, and at Burnswark in Dumfriesshire. Of the Old English poem on the victory, preserved in the Chronicle, there is a spirited version by Lord Tennyson.

Brunck, **RICHARD FRANÇOIS PHILIPPE**, classical scholar, was born at Strasburg, December 30, 1729. He was educated under the Jesuits in Paris, but abandoned his studies, and for some time was engaged as a military commissary during the Seven Years' War. A professor in Giessen, with whom Brunck happened to lodge while the army was in winter-quarters, revived in him the love of classical studies. Returning to Strasburg, he devoted all his spare time to Greek, and soon distinguished himself as an able but daring critic and emendator. His belief that all inaccuracies in ancient Greek writings were introduced by copyists often led him astray; but few critics since the revival of learning have done more for the progress of Greek literature. His first work, *Analecta Veterum Poetarum Græcorum* (1772-76), was followed by editions of Anacreon (1778), Apollonius Rhodius (1780), Aristophanes (1781-83), *Poeta Gnomici* (1784), Virgil (1785), and Sophocles (1786). The outbreak of the French Revolution interrupted Brunck's studies. During the Terror he was imprisoned, but was liberated after the downfall of Robespierre. His means had been so much reduced, that he was compelled to sell his valuable library. He died June 12, 1803.

Brune, **GUILLAUME MARIE ANNE**, a French marshal of the First Empire, was born at Brives-la-Gaillarde, 13th March 1763. At first a Paris bookseller, he was a member of the Cordeliers' Club, and a friend of Danton. In 1792 he was sent as civil commissary to Belgium, but he soon entered the army, fought in the Vendean war and in Italy under Massena, and after Rivoli, was made general of division. Sent by the Directory to Switzerland in 1798, he executed his orders with brilliant success. In 1799 he was appointed to the command of the army of Holland, where he achieved the reputation of being one of the best generals of his age. He defeated the Duke of York at Bergen, September 19, and forced him to capitulate at Alkmaar. In 1803 he was ambassador to Turkey; next year he obtained the dignity of marshal. In 1807 he became governor-general of the Hanseatic towns, but soon exciting the distrust of Napoleon, was recalled. After the return from Elba he joined the emperor, was made a peer, but, like many better

men, had his prospects blasted by Waterloo. On 2d August 1815 he was brutally murdered by an infuriated royalist mob at Avignon. See *Lives* of him published in 1821 and 1887, and that by Maitmoiton (1900).

Brunel, **ISAMBARD KINGDOM**, engineer, only son of the following, was born at Portsmouth, 9th April 1806, and in 1823, after two years spent at the college of Henri Quatre, in Paris, entered his father's office. He helped him in the construction of the Thames Tunnel, and himself, in 1829-31, planned the Clifton Suspension Bridge, which, commenced in 1835, was completed only in 1864 with the materials of his own Hungerford Suspension Bridge (1841-45) over the Thames at Charing Cross (see **BRIDGE**, p. 445). He designed the *Great Western* (1838), the first steamship built to cross the Atlantic, and the *Great Britain* (1845), the first ocean screw-steamer. The *Great Eastern* (q.v.), the largest vessel ever built in the world, was built under his sole direction in 1853-58. In 1833 he was appointed engineer to the Great Western Railway, and designed and constructed the whole of the tunnels, bridges, viaducts, and arches on that line. Among docks at English seaports, in the improvement or construction of which he was engaged, may be mentioned those of Bristol, Monkwearmouth, Cardiff, and Milford Haven. Made a Fellow of the Royal Society in 1830, he was chosen on the Council of the Institution of Civil Engineers in 1845, and its Vice-president from 1850. He died suddenly, 15th September 1859. See his *Life* by his son (1870).

Brunel, **SIR MARC ISAMBARD**, engineer, was born, a farmer's son, at Hacqueville, near Rouen, in France, April 25, 1769. He was destined for the church, but early showed an inclination for mechanics, and at school preferred the study of the exact sciences to the classics. In 1786 he became a sailor in the French navy. In the revolutionary period of 1793, having compromised himself by his political opinions, he escaped from Paris to the United States. His career as an engineer began in 1794, when he was appointed to survey for the canal which now connects Lake Champlain with the river Hudson at Albany. He afterwards acted as an architect in New York, for which city he was appointed chief-engineer, and erected an arsenal and cannon-foundry, with ingenious machinery for casting and boring. On his return to Europe in 1799, he married the daughter of William Kingdom, Plymouth, and settled in England. His mechanical skill was shown in various minor inventions, such as a writing and drawing machine, and a machine for winding cotton thread. A plan submitted by him to government for making block-pulleys for ships by machinery was adopted in 1803, and he was for many years employed in carrying it into execution in Portsmouth dockyard. On the completion of the machinery in 1806 the saving on the first year in the manufacture of the blocks was about £24,000. He received £17,000 from government as a reward for this invention. He was also successful in the construction of other public works—in Woolwich arsenal and Chatham dockyard, &c. He made experiments in steam-navigation on the Thames in 1812, but his proposals for the use of steam-tugs were declined by the navy board. The destruction of his sawmills at Battersea by fire (1814) led, with financial mismanagement, to his bankruptcy (1821), when he was thrown into prison for debt. He was released from prison on a grant of £5000 being made by government for payment of his debts. His most remarkable undertaking was the Thames Tunnel beneath the bed of the river, which, commenced in March

1825, was opened in March 1843. Assisted by his son, Isambard Kingdom Brunel, he for ten years pursued a course of experiments for employing carbonic acid gas as a motive power, but the cost of the machinery prevented its introduction as a substitute for steam. Among the less important of Brunel's inventions were machines for making wooden boxes; for ruling paper; for shuffling a pack of cards without using the hands; for the manufacture of nails; for making seamless shoes for the army; a knitting-machine; a preparation of tinfoil for ornamentation; and improvements in stereotype plates. Elected a Fellow of the Royal Society in 1814, he was appointed Vice-president in 1832, and was a member of various foreign societies. He was knighted in 1841; and died December 12, 1849, in his eighty-first year. See his Life by Beamish (1862).

Brunelleschi, FILIPPO, one of the greatest Italian architects, was born at Florence in 1377. A goldsmith first, then a sculptor, he finally devoted himself to architecture, studying zealously perspective and geometry. At Rome he became imbued with classical traditions, and soon after his return to Florence in 1407, he offered his plan for completing the cathedral of Santa Maria del Fiore, founded in 1296, and now only wanting a dome. The great work, which served as model to Michelangelo at St Peter's, was begun in 1419 and almost finished when he died at Florence in 1446. He was also architect of the Pitti Palace.

Brunetière, FERDINAND, critic, was born at Toulon, 19th July 1849, wrote much for the *Revue des Deux Mondes* (its editor from 1893), became professor at the Ecole Normale and a member of the Academy (1894), and died 9th December 1906. Besides *Études Critiques* and *Questions de Critique*, he published *Histoire et Littérature* (1884-87), *Le Roman Naturaliste* (1883), *History of French Literature* (trans. 1898). See monograph by Faguet (1911).

Brunhilda. (1) in the *Nibelungenlied*, the young and stalwart queen of Iceland, wife of Gunther, the Burgundian king. She hated passionately Kriemhild and her husband, Siegfried, who had once been her own lover; and she caused his murder by the hands of Hagen. Originally she was identical with the Norse Walkyrie *Brynhildr*, who for a fault was stripped of her divinity by Odin and sunk into a charmed sleep from which she was awakened by Sigurd (Siegfried).—(2) The daughter of the Visigothic king Athanagild, married King Sigbert of Austrasia in 567, and afterwards as regent for her two grandsons, Theodebert II., king of Austrasia, and Theodoric II., king of Burgundy, divided the government of the whole Frankish world with her rival Fredegond, who governed Neustria for the youthful Clotaire II. On the death of Fredegond in 598 she seized on Neustria, and for a while united under her rule the whole Merovingian dominions, but was overthrown in 613 by a combination in their own interests of the Austrasian nobles under the nominal leadership of Clotaire II., and put to death by being dragged at the heels of a wild horse.

Bruni, LEONARDO, a famous humanist, a native of Arezzo, and hence styled *Aretino*, was born in 1369. He first studied law at Florence and Ravenna, but afterwards turned his attention to classical literature. In 1405 he obtained the office of papal secretary, and as such served under four popes, the last of whom, John XXIII., he attended to the Council of Constance. On his patron's deposition he returned to Florence. His *Historia Florentina* procured for him the rights of citizenship, and at a later period, through the favour of the Medicean family, he was appointed state secretary. He died 9th March 1444. Bruni aided

in advancing the study of Greek literature mainly by his literal translations into Latin of Aristotle, Demosthenes, Plato, and Plutarch. Among his original works were *Commentarius Rerum suo Tempore Gestarum* (Ven. 1476), *De Origine Urbis Mantuæ*, *De Romæ Origine*, *Epistolæ Familiæres*, and Lives of Petrarch and Dante in the vernacular.

Brünig, a Swiss pass (3396 feet), forming the shortest and easiest route between the 'Forest Cantons' and the Bernese Oberland. A road was formed in 1857-62, and in 1888 a Brünig branch of the Berne-Lucerne Railway was opened.

Bruni Island (North and South) lies off the south coast of Tasmania, about 20 miles below Hobart, from which it is separated by D'Entrecasteaux Channel. It has a length of 32 miles, a varying breadth of 1 to 11 miles, and an area of 160 sq. m.

Brünn (Cz. *Brno*), a city of Czechoslovakia, the capital of Moravia, is beautifully situated, partly on the slope of a hill, and partly in a pleasant valley at the confluence of the Schvazawa and the Zvittawa, 93 miles N. of Vienna by rail. Behind the city, on an eminence (934 feet), rises the castle of Spielberg, formerly the citadel, notorious as the state-prison where Silvio Pellico was confined from 1822 to 1830. The Czech 'university of Masaryk' was inaugurated in 1919. Brünn was surrounded by walls till 1860. Among the most interesting buildings are the cathedral of St Peter; St James's Church, a Gothic edifice, with a tower 305 feet in height; the church of the Minorites; and the Augustine convent of which Gregor Mendel (q.v.) was a monk. The Stadttheater, opened in 1882, was the first continental theatre lit by electricity. Brünn is a very important manufacturing town. Its woollens are specially celebrated, and it has also large manufactures of machinery, linen, leather, paper, ironware, upholstery, liqueurs, and numerous chemical products. Pop. 220,000 (nearly half Czechs).

Brunne, ROBERT OF, the name by which Robert Manning, a monk of the order founded by St Gilbert of Sempringham, is usually designated. His monastery was in South Lincolnshire, near the modern town of Bourn, and he lived in the reigns of Edward II. and Edward III., and probably died about 1340. His chief work is his *Handlyng Synne*, a free and amplified translation into English verse of William of Waddington's *Manuel des Pechiez*, with such judicious omissions and excellent additions as made his version much more entertaining than the original. The purpose of the book was to convey religious instruction to the people in the agreeable form of moral anecdotes. It is of great importance from the linguistic point of view as one of our best landmarks in the transition from the early to the later Middle English. He also made a new version in octosyllabic rhyme of Wace's *Brut d'Angleterre*, and added to it a popular translation of the French rhyming chronicle of Peter Langtoft of Bridlington. Robert deliberately wrote in English instead of French, in order to reach the common people, to give them the means 'for to haf solace and gamen, in felauschip when tha sit samen [together].'

Brunnen, a village, the port of the Swiss canton of Schwyz, on the Lake of Lucerne, near the mouth of the Muotta, 17 miles by water, but 28½ by rail ESE. of Lucerne. Here in 1315, after the battle of Morgarten, the deputies of the Forest Cantons formed a league.

Brunnow, PHILIPP, COUNT VON, a Russian diplomatist, was born at Dresden in 1797, and entered the Russian service in 1818. He was present in a civil capacity in the campaigns of

1828 and 1829 against the Turks, and in 1839 he was sent on a special mission to London, where, in the following spring, he was accredited as permanent ambassador. In this capacity he soon acquired distinction as a diplomatist. After retiring from London on the outbreak of the war in 1854, he represented Russia in Frankfurt, and, along with Count Orloff, was sent to the Conference of Paris in 1856. He was afterwards appointed to the court of Prussia; but in 1858 he returned to his old place in London, where he represented Russia at the conferences in 1864 and 1871. He was raised to the rank of count in 1871, and in 1874 retired to Darmstadt, where he died 12th April 1875.

Bruno, GIORDANO, a fervid, restless, profound philosopher, was born at Nola, in the kingdom of Naples, about the middle of the 16th century. He entered at an early age the order of the Dominicans, but soon began to express his doubts in regard to the doctrines of Transubstantiation and of the Immaculate Conception, in consequence of which he was obliged to flee from his convent. Henceforth his life was unsettled. In 1577 he went to Geneva, where he spent two years, but having excited the suspicion and dislike of the strict Calvinists of that city by his general scepticism, he judged it prudent to betake himself to Paris, where he delivered prelections on the 'Great Art' (Logic) of Raymond Lully. His disputes with the bigoted Aristotelians of the university of Paris compelled him, however, to leave France. He passed over into England, where he resided for two years in comparative quiet, enjoying the friendship of Sir Philip Sidney and the protection of the French ambassador, Michel de Castelnau. Here he composed his most important works, but at last, having incurred the displeasure of the clergy by his vehement denunciation of the Aristotelian philosophy and by other grave heresies, he returned to Paris in 1585. In 1586 he proceeded to the university of Marburg, where he matriculated, but was forbidden to lecture, and to Wittenberg, where he became professor. After spending some time in Prague, Brunswick, Helmstedt, and Frankfort-on-the-Main, he resolved to go back to Italy. He fixed his residence at Padua; but venturing to settle in Venice, he was arrested by the officers of the Inquisition, and conveyed to Rome in 1593. He was now subjected to a long imprisonment and persecution, in the vain hope that he would recant; but when all the endeavours of his enemies proved ineffectual, he was brought to the stake, 17th February 1600, and burnt as a heretic. On the scene of his martyrdom, the *Campo dei Fiori*, a monument to his memory was unveiled in 1889. Two new editions of his works, one by Lagarde and one by Tocco and Vitelli, have been published.

Bruno's writings, of which the most valuable are composed in Italian, display throughout a strong, courageous, excitable soul, susceptible of deep enthusiasm, full of mental unrest and scepticism, but guided by an unsatisfied yearning for truth. His speculations are sublime. The *Cena delle Ceneri*, or Evening Conversations on Ash-Wednesday, is an apology for the Copernican astronomy; the *Spaccio della Bestia Trionfante*, or Expulsion of the Triumphant Beast (Paris, 1584), is a satirical and somewhat heavy allegory in the style of the times, but it gives perhaps the clearest account of Bruno's philosophy. His greatest works are metaphysical, such as the *Della Causa Principio ed Uno* (On the One Sole Cause of Things), and the *Del Infinito Universo e Mondi* (On the Infinity of the Universe and of Worlds). The doctrine enunciated in these is Pantheistic (see PANTHEISM). Bruno held that the infinite soul of God did not merely inhabit or pervade the

universe, but that the universe was simply a manifestation of Him, and therefore itself divine. God was therefore, in the most literal and physical sense, all in all. Bruno's philosophy, in later times, was quite unappreciated and even neglected, until Jacobi drew public attention to it in his *Letters on the Doctrine of Spinoza*. Both Spinoza and Descartes were much indebted to Bruno. His influence is also discernible in the speculation of modern Germany; one of Schelling's notable works is entitled *Bruno*. But some modern critics are inclined to insist on his loquacity, bombast, quackery, and intellectual arrogance, and to deny him real originality.

See works on Bruno by Bartholmæss (Paris, 1846), Berti (Flor. 1880), Sigwart (Tüb. 1880), Brunnhofer (Leip. 1883), Miss Frith (1887), L. M'Intyre (1903), Alois Riehl (2d ed. 1900; trans. 1906), Boulting (1916), Gentile (1921), and especially Spampinato (1921); also J. A. Symonds's exposition of his teaching, and W. Pater's *Gaston de Latour* (1896).

Bruno, St., the founder of the Carthusian order, was born at Cologne about 1040, and received his earliest education there. Subsequently he became rector of the cathedral school at Rheims. But the wickedness of his time soon began to weigh upon his soul, and in 1086, with six friends, he betook himself to the wild mountain of Chartreuse, near Grenoble. Here he founded the order of the Carthusians (q.v.), one of the most austere of all the monkish orders. Bruno and his companions had each a separate cell in which they practised the severities of the rule of St Benedict, keeping silence during six days of the week, and only on Sundays seeing one another. Pope Urban II., who was one of Bruno's most eminent scholars, in 1089 summoned the saint to Rome. He obeyed the call reluctantly, and steadily refused all offers of preferment. In 1094 he established a second Carthusian monastery at Della Torre, in a solitary district of Calabria, where he died in 1101. He was canonised in 1628; his festival is the 6th October. Bruno left no written regulations for his followers. These first appeared in a complete form in 1581, and were enjoined on all Carthusians by Innocent IX.

Bruno the Great, one of the most eminent men of his time, was born about 925, the third son of Henry the Fowler. He became archbishop of Cologne and chancellor of the empire under his brother Otto I., and afterwards Duke of Lorraine. Having done much to reform the monasteries and advance learning among the clergy, he died at Reims in 965.

Brunonian System. See BROWN (JOHN).

Brunsbüttel, a small port of Sleswick-Holstein, at the mouth of the Elbe, the terminus of the great North Sea and Baltic Canal.

Brunswick (Ger. *Braunschweig*), a state (formerly a duchy) of northern Germany, consisting of three larger and five smaller distinct parts, with a total area of 1418 sq. m. Pop. (1875) 327,493; (1919) 481,436. Of the three larger parts, the principal one, forming the circle of Wolfenbüttel, and including the capital, lies between Prussia and Hanover; the second, extending westward from Prussia to the Weser, divides Hanover into two parts; and the third, forming the Blankenburg district, lies to the south-east, between Hanover, Anhalt, and Prussia. The smaller parts are the isolated *enclaves* of Calvörde in the east, Thedinghausen in the west (not far from Bremen), and some very small demesnes on the Hanoverian boundaries. Brunswick belongs mostly to the basin of the Weser, which serves as a boundary on the west. Its surface is mostly mountainous, particularly in the southern portions of the country, but it has nevertheless level tracts of considerable

extent. The climate in the lowlands resembles the general climate of northern Germany; but in the Harz district it is so much colder that harvest is generally a month later than in the plains.

The quarries and mines of Brunswick produce marble, alabaster, limestone, coal, iron, copper, lead, sulphur, alum, and salt in large quantities, with some little gold and silver. Agriculture constitutes the chief wealth of the state. The pasture-land is extensive, and great attention is paid to the rearing of cattle, and especially to the breeding of sheep, wool being an important article of commerce. A large number of persons are employed in the cutting and preparation of timber. The manufactures are comparatively unimportant.

The inhabitants are mostly Saxons, and, with a few exceptions, adhere to the Lutheran Church. The people in the rural districts speak a very broad Low-German dialect; but good High-German is spoken by the educated classes. The government, till 1918, was a limited monarchy, the duke's power being restricted by the legislature. Under the constitution of 1922 a diet of 60 members is elected for four years by universal, secret, and direct vote of the people. The principle of proportional representation is observed. The diet chooses the ministry. The estates of the dukedom of Brunswick, which were very large, are now the property of the people.

Brunswick was included as a part of Saxony under the empire of Charlemagne. In 1235, with Lüneburg, it was made a duchy under Otto, who died in 1252, and was succeeded in 1267 by his son Albrecht, founder of the older line of Wolfenbüttel. John, another son of Otto, was the founder of the older Lüneburg line, which became extinct with William of Lüneburg in 1369. In 1569 Henry, who styled himself Duke of Brunswick-Lüneburg-Dannenberg, founded the new House of Brunswick-Wolfenbüttel; and his brother William founded the new line of Brunswick-Lüneburg, and so became ancestor of the House of Hanover (q.v.). The ancient ensign of the race is the white horse. Duke Frederick-William came to England in 1809, and with his 'Black Brunsvickers' (so called from their uniform, in mourning for the losses at Austerlitz) entered the British service, fighting in the Peninsular war till 1813, when he returned to his duchy; in 1815 he died a soldier's death at Quatre Bras. In 1884 the succession passed to the Duke of Cumberland, son of the dethroned George V. of Hanover. As he refused to recognise the new constitution of the German empire, the imperial government declined to allow the succession to take place, and an interregnum occurred. Prince Albrecht of Prussia was elected regent by the diet, and on his death Duke Johann Albrecht of Mecklenburg (1907). After the marriage of his son Ernst August with the Kaiser's daughter, the Duke of Cumberland renounced his claims in his favour, and Ernst August's accession was permitted in 1913. He was deposed in November 1918, and a republican government was set up.

BRUNSWICK, the capital, stands on the Oker, in a level and fertile district, 143 miles WSW. of Berlin. It is supposed to have been founded in 861, by Bruno, Duke of Ostfalen; but Henry the Lion, in the 12th century, so greatly strengthened and beautified the city that he may be almost said to be its founder. In the 13th century Brunswick became a member of the Hanseatic League, and soon attained considerable commercial prosperity, but its importance declined with the decay of the League. The town is most irregularly built, with narrow and crooked streets, but possesses the advantage of an abundant supply of water. The cathedral (1173-1469), and the churches of St Martin, St Catharine, and St Andrew with its steeple 341 feet high, are among the principal

buildings; the old Rathaus is a fine specimen of Gothic, and a number of the older houses are interesting for their quaintly carved wooden fronts. In the museum are some notable antiquities and works of art by Jan Steen, Albrecht Dürer, Holbein, Rembrandt, Raphael, Guido, Ruysdael, Michelangelo, and Benvenuto Cellini. The industry of the town consists chiefly in manufactures of tin-plate, canned foods, sausages, jute, woollen and linen, leather, sewing-machines, chicory, beet-sugar, tobacco, papier-mâché, and lackered wares, and in publishing. The old fortifications have been demolished, and their site converted into pleasant promenades. A fine avenue of lindens leads to the palace, an imposing edifice rebuilt in 1869. Pop. (1871) 57,833; (1891) 101,047; (1900) 128,231; (1910) 143,562; (1919) 139,544.

Brunswick, (1) a city, port of entry, and capital of Glynn county, Georgia, on St Simon Sound, an inlet of the Atlantic, 186 miles SE. of Macon by rail. It has connection by steamer with Savannah and New York, and exports cotton and timber; naval stores are manufactured. Pop. 14,000.—(2) A town of Cumberland county, Maine, 29 miles NE. of Portland by rail, is at the head of navigation on the Androscoggin River, whose falls or rapids supply water-power for cotton, paper, and other mills. It is the seat of Bowdoin College (1794), a Congregational institution of high standing, at which Nathaniel Hawthorne and Longfellow graduated; the Maine Medical School is affiliated to it. Pop. 7000.

Brunswick, NEW. See NEW BRUNSWICK.

Brunswick Black is a varnish employed for coating over coarsely finished iron grates, fenders, &c., and is prepared by melting together asphalt, linseed oil, and oil of turpentine. For finer work, it has been superseded by Berlin Black, a similar composition of finer quality.

Brunswick Green is a pigment of very variable composition. The native varieties sometimes consist of carbonates of copper: the artificial often contain arsenite of copper, Prussian blue, indigo, or chrome yellow. A superior product is obtained by the action of sal-ammoniac on copper filings, an oxychloride of copper being produced identical with the mineral Atacamite (q.v.).

Brusa. See BROUSSA.

Brush, GEORGE DE FOREST, American figure-painter, born at Shellyville, Tennessee, 28th September 1855, studied with Gérôme at Paris. He is a good colourist, careful in composition.

Brushes. The materials used for the manufacture of brushes are, taking first those of animal origin, hog's bristles, horse-hair, strips of whalebone, and to a smaller extent goat's hair, badger's hair, fitch (polecat), sable and camel's hair. Those of vegetable origin are principally aloe fibre, called also Mexican fibre (*Agave americana*); kittul fibre (*Caryota urens*); bass or piassaba fibre (*Atalea funifera*); and coconut fibre (*Cocos nucifera*). But many other vegetable fibres, as well as esparto grass and the like, are used locally for brushes or brooms in different parts of the world. Wire brushes are used for numerous mechanical purposes, a spiral brush with steel or brass bristles, according to the material to be cleaned, is used for tube-cleaning. Flat wire brushes are used by engineers to remove scale from corroded metal, and by moulders to brush sand from castings. Such brushes are also employed in cleaning stonework.

For the stocks of the commoner kinds of brushes and brooms, native woods, such as the so-called sycamore (often called plane-tree), beech, elm, birch, chestnut, and oak, are employed, and ash for the handles of small brooms. Veneers or plates of rosewood and satin-wood, of ivory, tortoise-

shell, mother-of-pearl, xylonite, and silver adorn the backs and handles of toilet-brushes.

Bristles (q.v.), though less so than they were, are still the chief material used in the manufacture of brushes. They are so far sorted into qualities when received by the manufacturers, who separate the larger and more valuable sizes by means of steel combs with one row of vertical teeth. The largest size stick in the teeth of the first comb, the next size in the second comb, and so on. Every bundle of the better qualities yields a small proportion of long and strong bristles which have a high value, and are not made into brushes but sold to shoemakers. The bristles are also sorted by hand and a size stick or gauge into various lengths, and by the eye into various colours, as black, gray, white, and other shades. Either before or after they are sorted, bristles require to be washed, and the 'whites' are bleached with sulphurous acid or other agent (see BLEACHING). French white bristles are generally beautifully bleached.

A hair-brush may be taken as an example of how the class known as 'drawn' brushes are made. With the assistance of a perforated lead or wood

Fig. 1.

gauge the stock is drilled with holes for the tufts. These are formed by doubling the bristles, and are then drawn into their place by thin brass wire, which loops in tuft after tuft, and is continuous all through the filling of a single brush (see fig. 1, in which the bold line shows the wire). A back

which conceals this wire-looping is then glued on and otherwise fixed. It may be stated that a hair-brush has the points of the bristles of unequal length, in order to penetrate the hair. Hat-brushes and baby's hair-brushes are made of horse-hair. Brooms, bannister, and other 'set' brushes, many of which have long tufts, are made in a different way. The stocks are turned, cut to shape, and drilled with holes of the proper size, but in this style of work they are only sunk to a certain depth. The root ends of the tufts, which are also the root ends of the bristles, if they are not doubled, are first dipped into melted brushmakers' pitch, next tied with a string at the root, and again dipped into the pitch; this fixes the tuft when pushed with a certain twist of the hand into one of the holes of the stock. In some cases the stock is twisted with one hand, and the tuft held steady by the other. In this manner the broom or brush is filled with bristles.

A painter's round brush or sash tool is one of the simplest kinds of brushes, and is made in one way by fixing a bundle or tuft of bristles, previously dipped into a cement formed of rosin and linseed oil, to the end of a two-pronged wooden handle by a piece of twine, which is then coated with glue. There are other methods of binding the bristles of large round brushes, such as by an iron or copper ring, or by wire.

Whitewash and other flat brushes of similar shape consist, in some cases, of two, three, or more cylindrical brushes, placed side by side, and fastened separately on a projecting edge of a flat stock or handle. Each of these single brushes forming the compound brush is bound with twine or copper wire, the latter being now preferred. There are other kinds of the same shape differently made; one variety, for example, is merely a single brush of oblong form with the bristles held together by a strip of leather and nails; another sort is formed by tufts fixed with pitch in the manner of a hearth-broom. In those cases where the root ends of the

bristles are exposed, they are singed with a hot bar of iron. It is curious how sometimes one, sometimes another kind of these brushes is preferred for the same purpose in different districts of the country. The brushes used by artists are, for large sizes, made of hog's hair bound with tin, and for small sizes of sable and camel hair. The latter are either bound with quill or tin. A sable-hair pencil is the most costly brush for its size that is made. Softening brushes of badger's hair are used both by artists and grainers of wood.

Machine-made Brushes.—There are several kinds of mechanism in use for making brushes. The Woodbury machine, which has been extensively used in America, is perhaps the best known. Its chief parts are a comb with an arrangement for filling its divisions with bristles; a shaft to work devices by which the bristles are fed in tufts to plungers that double them, bind them with wire, and introduce them into the back of the brush; an arrangement by which the wire is fed to and through the bristles after doubling; and mechanism for centring the brush-back under the two plungers concerned in preparing and inserting the tuft. The machine is too elaborate for illustration here. Fig. 2 shows how the tufts are bound with wire, which takes the form of a spiral, and by a movement of the plunger is made to screw its way into the hole in the brush-back.

Fig. 2.

In England, machinery is chiefly applied to the manufacture of the cheaper kinds of brushes from vegetable fibres, although it is not confined to these. The fibres have to undergo a process of preparation. The tufts in these machine-made brushes are secured in different ways, such as by a cross wire, shown in fig. 3, or by a hard steel wire loop bent into a triangular shape, and placed as in fig. 4, with the shoulders pressed firmly on the sides of the drilled hole, and the points fixed to the bottom.

Brussels (Fr. *Bruxelles*; Flem. *Brussel*), the capital of Belgium, is situated in a fertile plain on the ditch-like Senne, 27 miles S. of Antwerp, and 193 N.E. of Paris. It communicates by ship-canal with Antwerp, and is a railway centre. The city has a circumference of about 5 miles, and is built partly on the side of a hill; though some of the streets are so steep that they can be ascended only by means of stairs, Brussels may on the whole be pronounced one of the finest cities in Europe. The Upper Town is the newest and most fashionable quarter, and is the residence chiefly of the great and wealthy. The king's palace, public offices, chief hotels, and mansions of foreign ministers are here. It is also much more healthy than the Lower Town, which is greatly subject to fogs, owing to its intersection by the canals and the Senne, although the stream now passes under an arched covering, which supports a boulevard. But the closely built old streets, with their numerous handsome buildings, formerly belonging to the Brabant

nobility, but now occupied by merchants and traders, have a fine picturesque appearance, while some of the public edifices are unrivalled as specimens of Gothic architecture. This part has also several noble churches, but it is now wholly given over to trade. French is spoken in the upper division; but in the lower Flemish is prevalent, and in one quarter the Walloon dialect is spoken. The English language, owing to the large number of English who reside here for economy, is also very common. The walls which formerly surrounded Brussels have been removed, and their place is now occupied by pleasant boulevards extending all around the old town, and shaded by alleys of limes. The *Allée Verte*—a double avenue along the Scheldt Canal—forms a splendid promenade, and leads toward the country palace of *Laeken*, 3 miles north of the city. Besides the fine park in the Upper Town, covering an area of some 32 acres, ornamented with fountains and statues, and surrounded

by the palace and other state buildings, Brussels has several other squares or places, among which the most noteworthy are: the *Place Royale*, with its colossal monument of Godfrey of Bouillon; the *Grand Place*, in which is situated the hôtel-de-ville, a splendid Gothic structure, erected in the beginning of the 15th century, with a spire of open stonework 364 feet high, and where, in 1568, the patriot counts, Egmont and Horn, were beheaded by order of the Duke of Alva; and the *Place des Martyrs*, where a memorial has been erected to those who fell here in the revolution of 1830. Among the churches the largest and finest is the cathedral of St Gudule, which dates from the 13th century, and is built in the pointed Gothic style, with many richly painted windows, and a pulpit considered to be the masterpiece of Verbruggen. The *Palais des Beaux Arts* contains the finest specimens of the Flemish school of painting, and a sculpture-gallery. The royal library adjoining has half a million volumes. The *Palais de Justice*, built in 1866-83 from designs by Poelaert at a cost of more than £2,000,000, is one of the most magnificent buildings in Europe. The royal palace and the national palace (for the chambers) are important buildings. There are several celebrated scientific societies, and educational institutions are both numerous and important. The university was founded in 1834. There are schools of painting and sculpture, and a conservatorium. The city contains also numerous charitable and benevolent institutions, and is the seat of the provincial government of Brabant, as well as of the general government of the kingdom. Brussels is one of the chief centres of the industry of the country. Its lace is particularly famous. Of the esteemed carpets which pass under the name of Brussels carpets, only a few are manufactured there, most of those of Belgium make being produced at Tournai. It has also manufactures of damask, linen, ribbons, embroidery, paper, jewellery, hats, soap, porcelain, mathematical and musical instruments, &c. Carriage-building is an important

branch of industry; and printing and lithographic establishments are numerous. Pop. (1846) 123,874; (1866) 157,905; (1885) 171,751; (1911) 177,078; (1920) 156,924, or with Laeken and other suburbs, some of which were annexed in 1921, 831,396.

As early as the 8th century we find *Bruchsellæ*, then probably a villa of the Frank kings, mentioned in old chronicles; and that a church existed here in 966 is proved by a deed of the Emperor Otho I. Under Charles V Brussels was made the court-residence in the Netherlands, and became afterwards, under Philip II., the chief arena of the revolution, and of the atrocities committed by the Duke of Alva and the Inquisition. The city suffered greatly in the war of Spain against Louis XIV.—in whose reign it was bombarded by Marshal Villeloi, and upwards of 4000 buildings destroyed—and in that of Austria against Louis XV.; but still more from the continual prevalence of party animosities caused by the policy of Austria.

Palais de Justice, Brussels.

Under the mild rule of Maria Theresa it flourished greatly, and in her time many of its best institutions and public buildings were founded. In 1789 occurred the Brabant revolution under Joseph II.; and scarcely had Austrian rule been re-established, after a brief time of independence, when Brussels fell into the hands of the French (1792). After other changes of fortune, Brussels, with the other parts of Belgium, was incorporated with the kingdom of the Netherlands in 1815, and so remained until the revolution of 1830 made it capital of independent Belgium. The exhibition of 1910 is memorable for a destructive fire. In 1914-18 Brussels was in German occupation, and Burgomaster Adolphe Max, its champion, was imprisoned. See LACE, CARPETS, and *The Story of Brussels* by Smith and Kimball (1906).

Brussels Sprouts, a sub-variety of kale or cabbage, *Brassica oleracea* (*B. O. bullata gemmifera*). The buds or sprouts that cluster in the leaf axils are highly esteemed for their delicate flavour and wholesome quality. Brussels sprouts is one of the hardiest of green winter vegetables, which, though chiefly cultivated in the gardens of the rich, is, on account of the great weight of crop it yields, and its extreme hardness, worthy of a considerable space being devoted to it in the gardens of the poor. There are strains of the plant distinguished from each

other by greater or less tallness of stem, and by the larger or smaller size and compactness of the sprouts. As a rule, the shorter-stemmed strains have the largest and most compact sprouts, and are consequently the most favoured. Like all the cabbage tribe, it requires deep rich soil to bring it to fullest perfection. The seed is sown in the open ground in February or March, according to the character of the weather, and again in late April or May to prolong the succession of crops. Those sown in February will come into use in October or November, and the later sowings successively for about six months. Having comparatively little spread of leaves, the plants may be set more closely than most other Brassicæ, from two to two and a half feet apart each way being the usual distances allowed from plant to plant.

Brussiloff, ALEXEI ALEXEIEVICH, Russian general, born in 1856, was educated in the Corps of Pages, served in the Russo-Turkish war, and became director of the Petrograd cavalry school. In the Great War he won distinction in command of the Russian advances through Galicia in 1914-17. In June 1917 he succeeded Alexieff as commander-in-chief under the provisional government. His troops, however, deserted him. He died—in poverty, it is said—in 1926.

Brut, or **BRUTUS**, the eponymous Trojan hero who gave his name to the island of Britain, according to Geoffrey of Monmouth, Wace, Layamon, and all the earlier historians in verse or prose. The great-grandson of Æneas, he was banished from Italy, and after many adventures, found his way to Albion, then the abode of giants, who were not destroyed without desperate fighting.

Bruttium, the country of the Brutii, anciently the name of the south-west peninsula of Italy. See CALABRIA.

Brutus, LUCIUS JUNIUS, in the legendary history of early Rome, the hero who overturned the monarchical and established the republican form of government. The son of a rich Roman, on whose death Tarquin the Proud seized the property and put an elder brother to death, he himself only escaped the same fate by feigning idiocy, whence the name *Brutus* ('stupid'). When the popular indignation was roused at the brutal outrage upon Lucretia, he placed himself at the head of the people, and drove the royal family from Rome. He was then elected one of the two first consuls (509 B.C.). With stern justice he sentenced to death his own two sons, detected in a conspiracy to restore the monarchy; and at last fell in mortal combat repelling an attack led on by one of the sons of Tarquin.

Brutus, MARCUS JUNIUS, born 85 B.C., appears to have spent the early years of manhood in exclusive devotion to literary pursuits, and not to have taken part in the political dissensions agitating Rome till he had attained a mature age. When the civil war broke out between Pompey and Cæsar, he sided with the former, but after the battle of Pharsalia made his submission to the latter, and in the following year was appointed governor of Cisalpine Gaul. On returning to Rome he divorced his wife in order to marry Portia, the daughter of Cato, of whose principles in politics he professed to be a disciple. The influence of Cassius prevailed upon him to join the conspiracy which ended in the murder of Cæsar (q.v.). The efforts of Brutus to retain popular favour afterwards being unavailing to counteract the effects of the eloquence of Antony, he was forced to leave first Rome, and then Italy. The remainder of his life was spent partly in Athens, partly in Asia Minor, and partly as the leader of a marauding force, which maintained itself by plundering the inhabitants of the eastern

shores of the Adriatic. Defeated at Philippi (42 B.C.; see AUGUSTUS), he fell upon his sword.

Brüx, or **MOST**, a Bohemian town, 78 miles NW. of Prague; near are coal-mines, and the Sedlitz mineral springs; pop. 26,000 (Germans).

Bruyère. See LA BRUYÈRE.

Bryan, WILLIAM JENNINGS, was born at Salem (Ill.), 19th March 1860, studied at Jacksonville and Chicago, and practised as a lawyer in Nebraska. He was elected to Congress in 1890, and in 1896 and 1900 was chosen Democratic candidate for the presidency. He advocated free coinage of silver and governmental control of railways and monopolies, was the labour candidate as against capitalists, and in his second candidature exposed expansion or imperialism, but was completely defeated by McKinley (q.v.) in 1896 and 1900, and by Taft in 1908. He was Secretary of State 1913-15. He led a crusade against evolution in 1925, and died 26th July 1926.

Bryanites. See METHODISTS.

Bryant, JACOB (1715-1804), born at Plymouth, was educated at Eton and King's College, Cambridge, and in 1756 became secretary to his old pupil the Duke of Marlborough. His chief work is the *Analysis of Ancient Mythology* (3 vols. 1774-76).

Bryant, WILLIAM CULLEN, a distinguished American poet and journalist, was born of good New England stock at Cummington, Massachusetts, 3rd November 1794. Trained to admire the poetry of Pope, he was early encouraged to imitate him. The most noted fruit of these attempts was *The Embargo, a Satire by a Youth of Thirteen* (Boston, 1807). In 1810 he entered Williams College, but soon resumed his studies at home, and formed himself by loving study of such poets as his favourites, Blair and Kirke White, while watching with a keen eye the quiet life of nature as he rambled among the woods. His quickened imagination found expression in the majestic blank verse of *Thanatopsis*, which, published in the *North American Review* for September 1817, was at once acknowledged to surpass in grandeur and beauty anything previously written by an American. Meantime Bryant had studied law, had been admitted to the bar, and had settled at Great Barrington. Being called to contribute further to the *Review*, he sent both verse and prose; among the former *Lines to a Water-fowl*, and among the latter a criticism on American poetry. In 1821 he delivered before the Phi Beta Kappa Society at Harvard a poem in Spenserian verse called *The Ages*. In the same year he was married to Miss Frances Fairchild, who inspired his poem *O Fairest of the Rural Maids*; but he also lost his father, to whom he paid a tribute in his *Hymn to Death*. Other noted poems of this time are: *The Revulet*, *The West Wind*, *Green River*, *The Forest Hymn*, and *Jume*, which were published in Boston periodicals. In 1825 the poet was induced by his friends to remove to New York to become editor of *The New York Review*, and when it failed a year later, he was made assistant-editor of the *Evening Post*. In 1829 Bryant became editor-in-chief, and by his ability, dignity, and steady adherence to principle, did much to raise the tone of the daily press. A collection of his poems was published in 1832, and, on its republication in England through Washington Irving, received favourable notice from *Blackwood's Magazine*. Bryant was now, however, absorbed in journalism. His paper was democratic in politics, but when the slavery question became prominent it inclined to the anti-slavery side, and in 1856 it assisted in forming the Republican party. As editor of an influential paper, Bryant was often called upon to make public addresses. A volume of

these addresses was published in 1873. His visits to Europe, the West Indies, and many parts of the United States, gave occasion for letters to his paper, which were republished, making three volumes. Meantime his poems had sunk deeply into the minds of his countrymen, and several editions, some of which were finely illustrated, were issued. In his old age, when relieved of the more pressing demands of a daily newspaper, he again permitted the deeper emotions of his heart to flow in verse. The poems of his age bear striking resemblance to those of his youth; they have the same grand simplicity, transparent clearness, wide generalisation. Sometimes, as in *Robert of Lincoln* and *The Planting of an Apple-tree*, he seemed to strike off a more airy and musical lyric than ever before. At seventy-two he commenced a translation of Homer's *Iliad* and *Odyssey* in English blank verse, which proved as inadequate as that of many greater men before him. Almost his last poem was *The Flood of Years*, a noble counterpart to *Thanatopsis*. On May 29, 1878, Bryant delivered an eloquent address at the unveiling of a bust of Mazzini, in Central Park, New York. After its close, in entering a house, he fell on the doorstep, receiving injuries of which he died 12th June.

His complete works were published in 4 vols. (1883-84); his Life was written by his son-in-law, Parke Godwin (2 vols 1883). See also the works on him by J. Bigelow (1890) and A. C. Bradley (1906), and the criticisms by Stedman and Barrett Wendell.

Bryce, RT. HON. JAMES, VISCOUNT (1914), O.M., was born at Belfast, 10th May 1838, and educated at Glasgow University, and at Trinity College, Oxford, where he graduated in 1862 as double first. Called to the bar in 1867, he was in 1870-93 regius professor of Civil Law at Oxford, and sat in parliament in 1880-1907. In 1886 he was made Under-secretary for Foreign Affairs, in 1892 Chancellor of the Duchy of Lancaster, in 1894-95 President of the Board of Trade, in 1905 Chief Secretary for Ireland, and in 1907-12 was ambassador to the United States. A strong home-ruler, he was active in connection with university reform, the Eastern question, commons and access to mountains, and copyright; and wrote *The Holy Roman Empire* (1864), *Transcaucasia and Ararat* (1877), *The American Commonwealth* (1888), *Two Centuries of Irish History, 1691-1870* (1888), *Impressions of South Africa* (1897), *Studies in History and Jurisprudence* (1901), *Studies in Contemporary Biography* (1903), *South America* (1913), *Modern Democracies* (1921). He died 22d January 1922.

Brydges, SIR SAMUEL EGERTON, born at Wootton House, Kent, in 1762, was educated at Cambridge and called to the bar, but retired to his country house (Denton Court) and to literature. Better than his poetry and novels were his edition of Edward Phillips's *Theatrum Poetarum Anglicanorum*, vol. i. (1800); his *Censura Litteraria* (10 vols. 1805-9); and his edition of *Collins's Peerage of England* (9 vols. 1812). The claim of his family to the barony of Chandos broke down, but Brydges was gratified with a Swedish knighthood in 1808 and an English baronetcy in 1814. He represented Maidstone in 1812-18, and printed privately at the 'Lee Priory Press' small editions of many rare Elizabethan books and tracts. After 1818 he lived mostly abroad until his death near Geneva, 8th September 1837. His later bibliographical works were the *British Bibliographer* (4 vols. 1810-14); *Restituta* (4 vols. 1814-16); and *Excerpta Tudoriana* (2 vols. 1814-18). His *Autobiography* was published in 1834.

Bryennios, PHILOTHEOS, theologian, born at Constantinople in 1833, studied at home and in Germany, and presided over the great Greek school

in Constantinople from 1867 to 1874. He was one of two representatives of the Greek Church at the Old Catholic conference in Bonn in 1875, and while absent there was chosen Metropolitan of Serrae in Macedonia. In 1877 he was translated to Nicomedia. Bryennios is known as editor of the Epistles of Clement (q.v.) and discoverer of the *Didachê* (see APOSTLES, TEACHING OF THE).

Brynmawr, a place in Brecknockshire, 8 miles WSW. of Abergavenny, with ironworks; pop. 8000.—For Bryn Mawr College near Philadelphia, U.S., see WOMEN'S RIGHTS.

Bryology, the study of Mosses (q.v.).

Bryony (*Bryonia*), a genus of Cucurbitaceæ (q.v.), of which the Common Bryony (*B. dioica*) is the only British species. It is frequent in hedgerows in England, but becomes rarer in the north, and is not indigenous to Scotland. It has cordate palmate leaves, axillary bunches of flowers, and red berries about the size of a pea. It abounds in a fetid and acrid juice. The root-stock is perennial, very large, white and branched, has a repulsive smell, and is acrid, purgative, and emetic, owing to the presence of a bitter and poisonous

Common Bryony (*Bryonia dioica*):
a, flowering, and b, fruiting branch.

alkaloid, *brynonin*. *B. alba*, which is monœcious, with black berries, is common in Central Europe, and possesses similar properties. The root of both is applied to bruises, was formerly in use as a purgative, and its tincture is still employed in homœopathic and veterinary practice. The young shoots of both species are free from acrid and dangerous qualities, and are sometimes used as pot-herbs, especially in Eastern Europe.—The roots of other species of the genus are also acrid and purgative; and are used medicinally in India; but it is said that the root of *B. abyssinica*, when cooked, is eaten without danger.—*B. boylei* is a species found native in the southern United States.—Black Bryony (*Tamus communis*) is a plant of a different natural order (Dioscoreæ, q.v.). Its habit and distribution is similar to that of Bryony proper, but it may be readily distinguished by its simple entire heart-shaped leaves, which are smooth and somewhat glossy. The flowers are small and greenish, and the berries red, the root-stock very large and fleshy, black externally. The berries are unwholesome, and the whole plant is acrid, the roots so much so as to have been formerly employed for stimulating plasters. But the young suckers, in which the acrid principle is not

much developed, may be eaten like asparagus, after careful boiling with change of water.

Bryophyllum (Gr. *bryon*, 'blossom,' and *phylon*, 'leaf'), a genus of Crassulaceæ (q.v.). *B. calycinum*, a succulent shrubby plant, a native of the Moluccas, with oblong, crenulated leaves, and large drooping panicles of greenish-yellow flowers, is not unfrequent in British and other hothouses, being regarded as an object of interest on account of its producing buds on the edges of the leaves more readily than almost any other plant, especially when the leaf is pegged down upon the soil, the buds then at once forming independent plants. The same habit is exhibited by the British Bog-orchis (*Malaxis paludosa*), by some species of ferns, &c. The leaves are valued for poulticing in the East. See BUD and LEAF.

Bryophyta. See LIVERWORTS, MOSSES.

Bryozoa. See POLYZOA.

Bryum, a large genus of common Mosses (q.v.). They are all small, and generally grow in dense patches of a beautiful bright green.

Brześć-Litewsk. See BREST LITOVSK.

Brzezany, a town of Eastern Galicia, situated on the Złota-Lipa, 52 miles S.E. of Lemberg. It has manufactures of cloth, leather, meal, beer, and brandy. Pop. 12,000 (about half Jews).

Buache, PHILIPPE, a French geographer, born 1700, became in 1729 royal geographer, in 1730 a member of the Academy of Sciences; died in 1778. He published both atlases and geographical works.—His nephew, Jean Nicolas Buache (1741–1821), was also a celebrated geographer.

Buaze (*Securidaca* (*Lophostylis*) *longifolia* and *angustifolia*) is a Polygalaceous shrub found by Livingstone north of the Zambesi, where its twigs are employed as a source of fibre, which much resembles flax.

Bubalis, a genus in the Antelope division of hollow-horned even-toed Ruminants, not to be confused with the genus *Bubalus*—the Buffalo (q.v.). The species of *Bubalis* are among the more ox-like antelopes, and one of them is supposed to be the *Bubalis* of the ancients. In this genus the head is elongated, the snout broad, the horns twisted and present in both sexes, the tear-pits small, the back sloping off behind, the teats two in number.

Bubalis.

The Bubaline of the North African deserts (*B. mauritanica* = *Antelope bubalis*) is a handsome animal of a reddish-brown colour, standing about 5 feet high at the shoulder, living in herds, and readily tamed. It is figured on Egyptian monuments. The Hartebeest (*B. caama*) is found in

the south, is perhaps slightly larger, has a general gray-brown colour (black on the outside of the legs and on middle of forehead, with large white spots on haunches), and is at home on the mountains. The Sassaby (*B. lunata*), the Bastard Hartebeest of the Cape, is slightly smaller, and is differently coloured. The Bontebok (*B. pygarga*) is a smaller and more beautifully coloured form of the southern interior, where another species, the violet-coloured Blesbok, is also abundant. See ANTELOPE.

Bubastis (the *Pi-beseth* of Ezek. xxx. 17; now *Tel Bast*), a ruined city of Lower Egypt, on the eastern main-arm of the Nile, near Zagazig, named from the lion-headed and cat-headed goddess Bast, who was worshipped here with peculiar reverence. She was daughter of Ra, and bride of Ptah, and symbolised sexual passion. Her festival took place on the 16th of Khoiak (about Christmas). Bast (also called *Menk*) and Sekhet were regarded as sisters. Under the 25th dynasty (725–686 B.C.) the city was a royal residence, but after the Persian conquest (352 B.C.) it gradually lost its importance. The ruins of its great temple were discovered by M. Naville in 1887, and extensive excavations next year revealed that Bubastis was once the seat of a great Hyksos settlement.

Bubble Shell. See BULLA.

Bubo. See OWL.

Bubo, an inflammatory swelling of the glands in the groin; used occasionally also of the amput. See GONORRHEA, INFLAMMATION, PLAGUE.

Buccaneers (through the Fr. verb *boucaner*, and noun *boucanier*, from Caribbean *boucan*, 'smoke-dried meat'), a name given to the celebrated associations of piratical adventurers, who, from the commencement of the second quarter of the 16th century to the end of the 17th, maintained themselves in the Caribbean seas, at first by systematic reprisals on the Spaniards, latterly by less justifiable and indiscriminate piracy. The arrogant assumption by the Spaniards of a divine right to the whole New World, and their consequent exclusive monopoly of trade, could not of course be tolerated by the enterprising mariners of England and France, who began to band themselves together for mutual defence, and for the plunder of the common enemy. In 1625 an attempt was made to found a settlement on the island of St Christopher as a centre of smuggling enterprise with San Domingo, and in 1630 the small island of Tortuga was seized and converted into a stronghold. From this the buccaneers made their incursions against the Spaniards, and here they stored the gains of their roving adventurous life. Their earlier history shows that they had a rude honour and fidelity in their relation with one another, which attracted to their flag hundreds of adventurous spirits from every European trading nation. Tortuga was taken and retaken by the Spaniards, but the capture of Jamaica in 1655 finally gave the buccaneers a surer footing. Their power had now become considerable, and their seamen were as famous for their desperate courage as for their consuming hatred of the Spaniards. Their history embraces narratives of cruelty and bloodshed hardly to be surpassed in the annals of crime, but is brightened by many a story of high and romantic adventure, of chivalrous valour, and brilliant generalship. Among the 'great captains' whose names figure most prominently in the records of buccaneering were the Frenchman Montbars, surnamed by the terrible title of 'The Exterminator'; Peter of Dieppe, surnamed 'The Great'—as truly, perhaps, as many others so distinguished; L'Olonnois; Michael de Busco and Bartolomeo de Portuguez; Mansvelt, and Van

Horn. Pre-eminent, however, among them all was the Welshman, Henry Morgan, afterwards knighted by Charles II. and made deputy-governor of Jamaica, a man of rare capacity and courage. He it was that led the way for the buccaneers to the Southern Ocean, by his daring march in 1671 across the Isthmus of Panama to the city of that name, which he took and plundered after a desperate battle. In 1680 they crossed the Isthmus of Darien and seized some Spanish vessels in the Bay of Panama, after which some returned, but others cruised for months through the South Sea, coming back with enormous wealth to the West Indies by Cape Horn. Other expeditions followed, whose ravages almost paralysed the Spanish trade in the Pacific. In 1685, when their fleet defied the Spanish power in the Bay of Panama, their glory was at its height. The strange confederacy now began to fall to pieces under the jealousies that grew up with wealth and greater security; and the next stages in their history are disunion, decay, and extinction. The war between France and Britain, after the accession of William III., dissolved the ancient alliance of the French and English buccaneers. After the Peace of Ryswick, and the accession of the Bourbon Philip V. to the Spanish crown (1701), the buccaneers finally disappeared to make way for a race of mere cut-throats and vulgar desperadoes, who lacked the greatness of their predecessors. The last event in their history was the capture of Cartagena in 1697, where the booty was enormous. See Dampier's *Voyages*; the *Narratives* of Wafer, Ringrove, and Sharp; Captain Bunney's *History of the Buccaneers of America* (1816); Thornbury's *Monarchs of the Main* (1855); Esquemeling's *Buccaneers of America*; C. H. Harrington's *Buccaneers of the West Indies in the 17th Century* (1910); J. Masefield, *The Spanish Main* (1910).

Buccari, or BAKAR, a small port of Croatia, on an inlet of the Gulf of Quarnero, 5 miles by rail ESE. of Fiume. Pop. 2000.

Buccinator (Lat. from *buccinare*, 'to sound a trumpet'), the name of a flat muscle in the cheeks, so called because, when the cheeks are distended with air, the contraction of the buccinator muscles forces it out.

Buc'cinum. See WHEELK.

Buccleuch, a small Selkirkshire glen, 18 miles SW. of Selkirk, with the site of an early stronghold of the Scotts, to whom it gave the title of earl (1619) and duke (1663). See SCOTT.

Bucen'taur (Ital. *bucentoro*), the name of the state-galley in which the former Doges of Venice used to sail out every year on Ascension-day, amid great festivities, in order, by sinking a ring into the sea, to wed it in token of perpetual sovereignty. The word signifies a monstrous figure of half bull, half man, such as may originally have been depicted on the vessel. The ceremony was already in use in the 13th century; in 1798 the last Bucen'taur, built in 1722-28, was burned by the French, but some portions, spared for their gold work, are still preserved in the arsenal.

Buceph'alus (Gr., 'ox-head'), the name of the favourite charger of Alexander the Great, was probably also the name of a peculiar breed of horses in Thessaly. The young hero was the first to break in the steed, and thus fulfilled the condition stated by an oracle as necessary for gaining the crown of Macedon.—The town BUCEPHALIA, on the river Hydaspes (Jhelum), in India, was founded near the grave of Bucephalus, who died during Alexander's Indian expedition.

Bucer, or BUTZER, MARTIN, reformer, was born in 1491 at Schlettstadt, in Alsace. At the age of fourteen he entered the Dominican order, and

went to Heidelberg to study theology, Greek, and Hebrew. In 1521 he quitted the order, and was appointed chaplain to the Elector-Palatine, an acquaintance with the works of Erasmus having already inclined him towards Protestantism. He married a former nun in 1522, and next year settled in Strasburg. In the disputes between Luther and Zwingli, Bucer adopted a middle course, and endeavoured to reconcile them; but his view of the sacraments, which approached that of Zwingli, exposed him to Luther's harsh reprobation. At the Diet of Augsburg, where he conducted himself with great circumspection and moderation, he generally accorded with the Lutheran views, but, along with other Strasburg theologians, declined to subscribe to the proposed confession of faith, and afterwards drew up the *Confessio Tetrapolitana* (1530). At Wittenberg, however, an agreement was in 1536 entered into between Bucer and the Lutherans. In consequence of his refusal to sign the *Interim* (q.v.) in 1548, Bucer found his situation irksome in Germany, and therefore accepted Cranmer's invitation (1549), and came to England to teach theology at Cambridge, and assist in forwarding the Reformation. His modesty, blameless life, and great learning gained many friends in England; but his labours were soon terminated by death, February 27, 1551. His remains were interred in St Mary's, Cambridge, with great solemnity, but during Mary's reign were exhumed and burned in the market-place. Bucer's constant attempts to express himself in language agreeable both to Luther and Zwingli, induced in him at times an obscure and ambiguous style, and Bossuet stigmatised Bucer as 'the great architect of subtleties.' His work, a translation and exposition of the Psalms, he published under the pseudonym Aretinus Felinus (1529). Lenz edited (1880) his correspondence with the Landgrave of Hesse, whose 'second' marriage Bucer defended.

See Baum, *Capito und Butzer* (1860); Tollin, *Secret und Butzer* (1880); the article by Sir A. W. Ward in the *Dictionary of National Biography*; the bibliography by Mentz and Erichson, published on his jubilee in 1891; and the book on him by A. Lang (Leipzig, 1900).

Buch, LEOPOLD VON, German geologist, was born at Schloss-Stolpe, near Angermünde, in 1774, and received instruction under Werner at the Mining Academy, Freiberg. He afterwards travelled in pursuit of his favourite science, through all the states of Germany, through Scandinavia as far as the North Cape, and through several parts of Great Britain, France, and Italy, visiting the Canary Islands in 1815. He strenuously upheld the now exploded theory of 'Elevation Craters,' according to which volcanic mountains have been formed by a single sudden swelling-up into a hollow bladder of previously existing horizontal beds of lava and scoria. He died in Berlin, March 4, 1853. His collected works fill 4 vols. (1867-85).

Buchan, the north-east district of Aberdeenshire (q.v.), lying between the Ythan and the Deveron. It rises in Mormond Hill to 769 feet; portions of the coast are bold and precipitous, and 6 miles south of Peterhead are the famous Bullers of Buchan, a huge vertical well in the granite margin of the sea, 50 feet in diameter and 100 feet deep, into whose bottom the sea rushes by a natural archway. Buchan contains the towns of Peterhead, Fraserburgh, and Turfrie, besides the remains of the Abbey of Deer, and of several castles of the Comyns, who held the earldom of Buchan, but forfeited their title and property in 1309. See Pratt's *History* (1859), and the *Book of Buchan*, ed. Tocher (1910). Buchan Ness is the easternmost promontory of Scotland, 3 miles S. of Peterhead.

Buchan, DAVID, born 1780, was an officer in the British navy. He explored the river Exploit (1811), and penetrated 160 miles into the interior. In 1818 he was appointed to the command of a Polar expedition, at the same time as Ross and Parry started on their voyage in search of a north-west passage. Buchan reached Spitsbergen with the *Dorothea* and *Trent*, but failed to pierce the gigantic icy barrier. On his return he commanded for a time on the Newfoundland station, was appointed high-sheriff of Newfoundland (1825), and a few years later sailed northward again, and never returned. His name was removed from the list of living captains in 1839.

Buchan, ELSPETH. See BUCHANITES.

Buchan, JOHN, author, born at Perth, 26th August 1875, was educated at Glasgow and Oxford, and called to the bar in 1901. His best known works are *Prester John* (1910), *The Thirty-nine Steps* (1915), *Greenmantle* (1916), *History of the Great War* (1921-2), *Huntingtower* (1922), *The Dancing Floor* (1926).

Buchan, PETER, an industrious collector of Scottish ballads, was born at Peterhead in 1790. At twenty-four he published an original volume of verse, next taught himself copper-engraving, and after learning the art of printing at Stirling in ten days, set up a press at Peterhead (1816). He afterwards removed to London, but returned after two years to Peterhead, where by his business he made money enough to buy a property in Stirlingshire. He died in London, 19th September 1854. Buchan's *Ancient Ballads and Songs of the North of Scotland* (Edinburgh, 1828) contained about forty new ballads, and many fresh versions of ballads printed elsewhere. A second collection was edited for the Percy Society in 1845 by J. H. Dixon. Buchan's books include *Annals of Peterhead* (1819), and *The Eglinton Tournament and Gentlemen Unmasked* (Glasgow, 1839).

Buchan, WILLIAM (1729-1805), physician, was born at Anorum, and studied divinity and medicine in Edinburgh. He settled in Sheffield, but removed to Edinburgh about 1766, where he practised and lectured on natural philosophy. His *Domestic Medicine* (1769) enjoyed immense popularity, 80,000 copies being sold during Buchan's lifetime. He removed to London in 1778. He also wrote *Cold Bathing* (1786), *Diet* (1797), and *Offices and Duties of a Mother* (1800).

Buchanan, CLAUDIUS, born at Cambuslang, near Glasgow, 12th March 1766, studied for two years at Glasgow University, and afterwards, through the influence of the Rev. John Newton, at the university of Cambridge (1791-95). From 1797 he was a chaplain in the East India Company's service at Barrackpur, where he studied Hindustani and Persian; in 1799 he removed to Calcutta, and became vice-provost of the college founded by Lord Wellesley at Fort William. He translated the Gospels into Persian and Hindustani, and made two tours through southern and western India; but debarred as a chaplain from directly engaging in missionary enterprise, he returned in 1808 to England. There, by his sermons and his periodical, *The Star of the East*, he excited so much popular interest that the government took his side, and before his death, February 9, 1815, the first English bishop had been appointed to Calcutta. See his *Life* by Pearson (3d ed. 1819). His *Christian Researches in India* was published in 1858.

Buchanan, GEORGE, the most distinguished scholar whom Scotland has produced, and one of the most brilliant representatives of the intellectual and religious movements of his age, was born of parents poor, but of good descent, at

Killearn, in the county of Stirling, in February 1506. Buchanan received the rudiments of his education in Scotland; but at the age of fourteen was sent by an uncle to the university of Paris, where his chief study was the composition of Latin versé. The death of this uncle who had supported him, as well as the state of his own health, forced Buchanan at the end of two years to return to Scotland. After nearly a year's illness, he enlisted in a force led by the Duke of Albany against England; and from the hardships of this campaign his health again suffered severely. In 1524 he matriculated as a *pauper* student at St Andrews, and the next year took the degree of B.A. In 1526 he returned to France, took the degree of M.A. at the university of Paris, and after two years' great privations, was appointed professor in the college of Ste Barbe. About this time, also, he was engaged as tutor to the son of the Earl of Cassilis; and on his pupil's return to Scotland, probably about 1535, Buchanan accompanied him. On the termination of this engagement, he was intrusted by James V. with the education of one of his illegitimate sons. To this period belong Buchanan's two satires against the Franciscans, the *Somnium* and *Franciscanus*, the latter prompted by the king himself, who, nevertheless, was either unable or unwilling to shield Buchanan from the anger of the Order. Buchanan was imprisoned with the connivance of James; but, having made his escape, also with James's connivance, he fled to England, whence, after a short stay, he proceeded to Paris (1539). Finding Beaton here, he hastened to Bordeaux on the invitation of André de Gouvéa, the head of the college in that city, and in that college acted as one of the professors for the next three years. During his stay here Buchanan wrote and translated several plays, mainly with the object of weaning the tastes of the students from the allegorical representations so popular at that time. In 1542 he had to flee from Bordeaux on account of a satire he wrote against the clergy, and thereafter for some years taught in various schools in France, among others the Collège Cardinal le Moine, Paris. In 1547, again through Gouvéa, he was appointed professor in the newly founded university of Coimbra, in Portugal. Gouvéa, however, dying shortly afterwards, the Jesuits, who were supreme in Portugal, had him imprisoned in the dungeon of the Inquisition in Lisbon on a charge of heresy. After a year's imprisonment, he was confined in a monastery, where he composed his famous Latin version of the Psalms. On his release he shortly afterwards proceeded to England, and thence again returned to France towards the end of 1552. In 1555 he was appointed tutor to the son of the famous Maréchal de Brissac, an engagement which he held for five years. Now a Protestant, Buchanan returned to Scotland, and never again left it for a lengthened period. The notices we have of him during this last period of his life show that he played an important part in public affairs. Immediately on his arrival in Scotland, he became classical tutor to Queen Mary, and to her he dedicated his completed version of the Psalms. In 1566 Murray appointed him principal of St Leonard's College, St Andrews; and during three successive years he was chosen one of the four electors of the rector. As a Protestant he took the side of the Protestant lords in their conflict with Queen Mary, against whom he wrote his notorious *Detectio*, in which he vehemently charged her with the murder of Darnley. Ten days after Mary's imprisonment in Lochleven, Buchanan was chosen moderator of the General Assembly that met in Edinburgh, June 25, 1567; and the next year he accompanied Murray to the celebrated Conference of York, where the question of Mary's

part in Darnley's murder was brought before the commissioners of Elizabeth, with no definite result. During the regency of Lennox, Buchanan was appointed tutor to the young king, James VI. In after-years James spoke with pride of his great teacher, though his feeling towards him had more in it of respect than affection. In 1570 Buchanan was made keeper of the Privy Seal, an office that entitled him to a seat in parliament. He resigned this post in 1578, and devoted his remaining years to the completion of his *History of Scotland*, which was published just thirty days before his death. He died on the 28th of September 1582, and was buried in Greyfriars' Churchyard, Edinburgh, at the expense of the city.

In his own day, Buchanan had a European reputation, which rested mainly on his skill in Latin poetry. This was an exercise in which all his learned contemporaries vied with each other; and by their unanimous admission, Buchanan was on this ground without a rival. The publication of his *History of Scotland* was looked forward to as an event in the history of letters. The only part of this history which still retains a certain importance is that which deals with the events of his own time. Of these, indeed, his account is that of a strong partisan; but it is also the account of a practical statesman and a far-seeing observer. Buchanan's influence subsequent to his death was chiefly through his tract *De Jure Regni*. In this tract, written in the form of a dialogue between himself and a brother of Maitland of Lethington, he states with the utmost boldness the doctrine that kings exist by the will, and for the good, of the people. Buchanan's teaching on this point had a most powerful influence on many statesmen who took a leading part in the great political movements of the 17th century. For continental scholars and men of letters of his own age, Buchanan was the most distinguished person then living in Britain. He may, indeed, be fairly regarded as the most brilliant British humanist of the 16th century. As in the case of Erasmus, the reformer and the humanist were in Buchanan pretty well mixed. Up till his final return to Scotland, the humanist distinctly predominated. All through his life, indeed, he wrote against the monks; but it was not so much their false doctrine that offended him, as their ignorance and brutality. Moreover, much of his verse written during this period reveals a view of life far more suggestive of the irony of the humanist than the zeal of a religious reformer. It has been matter of dispute whether the subjects of his erotic verses were real persons or not; but some lines in one of his later poems seem clearly to prove that they were imaginary. On his return to Scotland, politics and religion gradually occupied more and more of his thoughts; yet it is a mistake to suppose that he ever became a politician or a reformer of the type of Knox or Andrew Melville. Our information regarding Buchanan is insufficient to enable us to form a distinct idea of the minuter shades of his character; but we can have no doubt that his personality was of the most commanding order. He had the reverence and affection of men themselves eminent for genius and virtue; while, by those opposed to him in politics and religion, he was spoken of as a monster of vice and ingratitude.

See D. Irving, *Life and Writings of Buchanan* (1807); Hume Brown, *George Buchanan, Humanist and Reformer* (1890); George Buchanan, *Glasgow Quatercentenary Studies* (1907). His *Vernacular Writings* were edited by Hume Brown (S. T. S. 1892).

Buchanan, JAMES, fifteenth president of the United States, was born near Mercersburg, Pennsylvania, April 23, 1791, the son of an immigrant Irish farmer. He was educated at Dickinson Col-

lege, and in 1812 was admitted to the bar, where he enjoyed a large practice. He served in the state legislature (1815-16), and in congress (1820-31). In 1832 he was sent as envoy-extraordinary to negotiate the first commercial treaty with Russia; and in 1833 he was elected a member of the United States senate, in which he sat till 1845. Appointed by President Polk, in March 1845, secretary of state, he held that office till the close of Polk's presidency, and by his firmness succeeded in settling the Oregon boundary question on lines satisfactory to the United States. Buchanan was ambassador to England from 1853 to 1856, and in the latter year, on the nomination of the Democratic party, he was elected president. During his administration the slavery question drew to a head. Buchanan himself was strongly in favour of the maintenance of slavery; his cabinet was largely made up of advocates of the system; and he freely supported the attempt to establish Kansas as a slave state. As the close of his term approached, it became evident that a conflict was impending, and the election of Lincoln precipitated the outbreak; on the 20th of December, South Carolina formally seceded. The president declined to reinforce Fort Sumter; but neither would he withdraw its garrison, and his cabinet, partaking in the sectional differences, hurriedly broke up. The closing days of his administration were marked by a supineness which facilitated the movements of the party of secession, by whom most of the forts and arsenals in the disaffected states were seized during the winter. After his retirement from office, Buchanan took no part in public affairs; but he published in 1866 a defence of his administration. He died June 1, 1868. See his *Life* by G. T. Curtis (1883), and his works (1900-10).

Buchanan, ROBERT, 'the poet of revolt,' was the son of a Glasgow socialist and journalist, but was born at Caverswall, near Longton, in Staffordshire, on the 18th August 1841. He was educated at Glasgow University, where his closest friend was the short-lived David Gray (q.v.). In 1860 the two set out for London to set the Thames on fire; but gloom and poverty hung over their steps. Buchanan's first work, *Undertones*, a volume of verse, published in 1863, was well received. The *Idylls and Legends of Inverburn* followed in 1865, and next year *London Poems*, the latter his first distinct success, and indeed a rare combination of lyrical vigour and insight into humble life, lightened up with humour and sweetened with pathos. Later volumes of verse are a translation of Danish ballads and *Wayside Poets* (1866); *North Coast Poems* (1867); *Napoleon Fallen: a Lyrical Drama* (1871); *The Drama of Kings* (1871); *Ballads of Love, Life, and Humour* (1882); and *The City of Dream* (1888). His article under the pseudonym of 'Thomas Maitland' on 'The Fleshly School of Poetry,' in the *Contemporary Review* for October 1871, earned an unhappy notoriety. Rossetti answered the attack on himself in a famous letter to the *Athenæum*; Mr Swinburne's scathing pamphlet, *Under the Microscope* (1872), followed, and eventually Buchanan withdrew the main part of his charge. Notable among his novels were *A Child of Nature* (1879), *God and the Man* (1881), *The Martyrdom of Madeline* (1882), and *Foaglove Manor* (1884). He was successful as a dramatist with *A Nine Days' Queen*, *Lady Clare*, *Storm-beaten*, *Sophia* (an adaptation of *Tom Jones*), and *Alone in London*, a well-known melodrama. His latest poems, *The Outcast* and *The Wandering Jew* (1893), attacked Christianity. A collected edition of his poems appeared in 1885. He died 10th June 1901; and his *Life* by his sister-in-law, Miss Harriet Jay, appeared in 1903.

Buchanites, an extraordinary sect of fanatics which sprang up in the west of Scotland in the last quarter of the 18th century. Its founder was Elspeth Buchan, born in 1738, the daughter of John Simpson, a wayside innkeeper near Banff. She married Robert Buchan, a potter, but ultimately separated from him, having begun meanwhile to preach strange religious doctrines which she professed to find in the Scriptures. At Irvine she became acquainted with the Rev. Hugh White, minister of the Relief Church there, a weak and vain man, who adopted her opinions, for which he was deposed by his presbytery. A few followers joined them, but the magistrates expelled her from the town in May 1784. Accompanied by White and a handful of crazy fanatics, she travelled towards Nithsdale, and found a resting-place in a barn at New Cample, near Thornhill. Their whole number was forty-six, and here they built for themselves a house of one apartment with a loft, in which they all dwelt, supported chiefly by the money of the more wealthy of their number. Mrs Buchan, who gave herself out as the woman of Rev. xii., seems to have been rogue as well as fool, for with all her other-worldliness she had a very mundane interest in money, and could hardly have herself believed in the bogus miracles she wrought. The poet Burns in a letter (August 1784) speaks of the idleness and immorality of her followers. They seem to have had a community of women. Mrs Buchan died in May 1791, and was buried clandestinely by White. The last survivor of her sect died in 1848. See *The Buchanites from First to Last*, by Joseph Train (Edin. 1846).

Bucharest (*București*), the capital of the former principality of Wallachia and of the present kingdom of Rumania, stands 265 feet above sea-level, in the fertile but treeless plain of the small, sluggish Dambovitza. By rail it is 716 miles SE. of Vienna, 40 N. of Giurgevo on the Danube, and 179 NW. of Varna on the Black Sea. A strange meeting-point of East and West, the town as a whole is but meanly built. An elaborate system of fortification was undertaken in 1885. There are some handsome hotels; and the metal-plated cupolas of the innumerable churches give to the place a picturesque aspect. The royal palace was rebuilt in 1885; and the Catholic cathedral is a fine edifice of 1875-84. The number of cafés and gambling-tables is excessive; and altogether Bucharest has the unenviable reputation of being the most dissolute capital in Europe, with all the vices but few of the refinements of Paris. There is, however, a university, founded in 1864. The *corso*, or public promenade, is a miniature Hyde Park. Chief articles of commerce are textile fabrics, grain, hides, metal, coal, timber, petroleum, and cattle. Its manufactures are unimportant, and the workmen are chiefly Hungarians and Germans. Bucharest has been several times besieged, and between 1793 and 1812 suffered twice from earthquakes, twice from inundations, once from fire, and twice from pestilence. It fell to the Germans in December 1916. At Bucharest in 1812 a treaty was concluded between Turkey and Russia, by which the former ceded Bessarabia and part of Moldavia; in 1886 the treaty between Serbia and Bulgaria was made there; by that of 1913 Rumania gained Bulgarian Dobrudja; by that of 1918 lost it again for a time, with other territory. The arsenal was blown up in May 1924. Pop. (1866) 141,754; (1892) 196,372; (1910) 293,435; (1917) 308,987.

Buchez, PHILIPPE BENJAMIN JOSEPH, a French physician and publicist, was born 31st March 1796, at Mortagne in Ardennes. After his studies at Paris, he took part in several of the secret plots against the Bourbons, and as a St Simonist edited

for some time the communist journal, *Le Producteur*. After the revolution of 1830, he established and conducted the journal *L'Européen*, as an organ of Neo-Catholicism, and, in concert with M. Roux Lavergne, began the *Histoire Parlementaire de la Révolution Française* (40 vols. 1833-38). His *Introduction à la Science de l'Histoire* had already appeared in 1833, and was followed by his *Essai d'un traité complet de Philosophie, au point de vue du Catholicisme et du Progrès* (3 vols. 1839-40). After the revolution of February 1848, Buchez was made president of the National Assembly; but his want of energy during the disturbance of May 15 cost him all political influence. On the establishment of the Empire, he returned to his studies. He died 12th August 1865.

Büchner, LUDWIG, physician and materialist philosopher, was born at Darmstadt, where his father was a doctor, 29th March 1824. He studied at Giessen, Strasburg, Würzburg, and Vienna. He became a lecturer at Tübingen University, and in 1855 published *Kraft und Stoff* (14th ed. 1876; Eng. trans. *Force and Matter*, 1870), in which he attempted scientifically to establish a materialistic view of the universe. A violent controversy was raised; and Büchner saw himself compelled to resign his university post, and begin medical practice in Darmstadt. He wrote much in periodicals on physiological and pathological subjects, as also in support of his atomistic philosophy; published *Natur und Geist* (1857; 3d ed. 1876), *Aus Natur und Wissenschaft* (1862), as well as works on Darwinism, the idea of God, the intelligence of animals; and translated Lyell's *Antiquity of Man* (1864). He died 2d May 1899.—His brother, GEORGE (1813-37), also a doctor by profession, made a name for himself as a poet; and his sister, LUISE (1823-77), was a poetess and novelist.

Buchu. See BUCKU.

Buck, a name sometimes distinctively appropriated to the adult male of the Fallow Deer (q.v.), the female of which is a *Doe*. But the term is often also applied to the male of other species of deer, as of the Roe (q.v.), although never to that of the Red Deer (see DEER), which, when mature, is a Stag or a Hart.

* **Buckau**, a manufacturing town of Prussian Saxony, incorporated in 1857 with Magdeburg (q.v.), of which it was a suburb.

Buck-bean, or MARSH TREFOIL (*Menyanthes trifoliata*), a species of Gentianaceæ (q.v.), widely

Buck-bean (*Menyanthes trifoliata*):
a, fruit; b, a flower.

distributed in all the colder parts of the northern hemisphere, common in Britain, and not rare in the northern parts of the United States and in Canada. It is easily recognised by its trefoiled leaves, and its small white or pink shaggy flowers.

These are dimorphic, like Primrose (q.v.) or Lythrum. It grows in marshy places, its creeping root-stocks and densely matted roots often rendering boggy ground firm. It is a traditional tonic and febrifuge in rustic and veterinary medicine, especially in Germany, and is also sometimes employed to give bitterness to beer. The root-stock was formerly used as a source of starchy food in Northern Europe.

Buck-eye, an American name for the species of horse-chestnuts (*Æsculus*, *Pavia*), more especially *Æ. glabra* and its varieties. *Pavia rubra* is known as red buck-eye, *Æ. flava* as sweet buck-eye, &c. See CHESTNUT.

Buckhound, a name applied to a variety of staghound, of which a royal pack existed until 1897. The mastership of the Buckhounds, abolished in 1901, was held by a nobleman who went in and out with the government. From 1366 till 1633 the mastership was hereditary in the Biocas family. See the monograph on the family by Burrows (1886), and histories of the hunt by J. P. Hore (1894) and Lord Ribblesdale (1898).

Buckhurst, LORD. See SACKVILLE.

Buckie, a fishing-town and police burgh of Banffshire, Scotland, 13 miles ENE. of Elgin by rail. 'The largest purely fishing-village' in Scotland, Buckie is the head of the fishery district from Banff to Findhorn. The harbour has been considerably improved. Pop. 9000.

Buckingham, a municipal borough in Buckinghamshire, almost encircled by the Ouse, is 61 miles NW. of London. An ancient place fortified by Edward the Elder (918), it yet has no antiquities, owing to a great fire in 1725. Since 1848 Aylesbury has superseded it as the assize town, and it lost its last member in 1885. The church (1781) was restored by Sir Gilbert Scott, who was born close by; and there are a town-hall of much the same date, and a grammar-school founded in 1548. The bobbin-lace manufacture has declined. Pop. 3000. Stowe House, the princely seat of the Dukes of Buckingham, 3 miles to the north-west, was rebuilt towards the close of the 17th century, and became a public school in 1923. William Giffard became Earl of Buckingham in the reign of William I. The same title was conferred on the youngest son of Edward III. For the first dukes of Buckingham, see below. In 1784 George Grenville, Earl Temple, became Marquis of (the town of) Buckingham, and in 1822 his son became Duke of Buckingham and Chandos. The title of Duke of (the county of) Buckingham was conferred in 1703 on John Sheffield (q.v.), Marquis of Normanby. His town house was bought by George III. in 1761, and became Buckingham Palace. (In 1746 the quite distinct title of Earl of Buckinghamshire was conferred on Sir John Hobart. Under the sixth earl in 1878 the name became Hobart-Hampden; the seventh added Mercer-Henderson.)

Buckingham, GEORGE VILLIERS, DUKE OF, second son of Sir George Villiers, was born at his father's seat of Brooksby, Leicestershire, in 1592. In 1614 he was brought under the notice of James I., and was soon received into high favour, as successor to the Earl of Somerset. He was knighted, raised to the peerage as Viscount Villiers in 1616, and became Marquis of Buckingham in 1618. Well-paid offices and rich lands were heaped on him so profusely, that, from a threadbare hanger-on at court, he became, with a single exception, the wealthiest noble in England. In 1620 he married the daughter of the Earl of Rutland, the richest heiress in the kingdom. In 1623, while the Spanish match was in progress, Buckingham persuaded Charles to go himself to Madrid and

prosecute his suit in person. The ultimate failure of the negotiations was greatly owing to Buckingham's arrogance. Both Charles and Buckingham returned from Spain in fierce wrath against that power. In his absence Buckingham was created a duke, and on his return nominated Lord-Warden of the Cinque Ports. He carried on the negotiation for the marriage of Charles with the Princess Henrietta of France; and on Charles's accession in 1625, the duke maintained his ascendancy at court. But after the ill-fated expedition against Cadiz, he became odious to the nation, was impeached by the Commons, and only saved by the king dissolving parliament. His insolent behaviour, shown at this period in making love to the queen of France, next helped to embroil us with that country. In 1627 he appeared with an armament before Rochelle, then in possession of the Huguenots, and in revolt against the French crown. But they refused him admission within the harbour; and when his troops made an ill-conducted descent on the neighbouring Isle of Rhé, they were defeated, and Buckingham returned in disgrace to England. He soon after undertook a second expedition to Rochelle, and had gone down to Portsmouth for embarkation, when on 23d August 1628 he was assassinated by a discontented subaltern, John Felton. See the Life of him by Philip Gibbs (1908).

Buckingham, GEORGE VILLIERS, second DUKE OF, was born at Wallingford House (on the site of the Admiralty), 30th January 1627, and, after his father's assassination, was brought up with Charles I.'s children. On the outbreak of the Civil War, he hurried from Cambridge to the royalist camp, and lost, recovered, and once more lost his estates—almost his life, too, during Lord Holland's unfortunate rising in Surrey (1648), when his younger brother did meet a hero's death. He attended Charles II. to Scotland, and after the battle of Worcester and an escape more marvellous even than his master's, went again into exile. Returning secretly to England, he married, in 1657, the daughter of Lord Fairfax, to whom his forfeited estates had been assigned. The Restoration gave them back to Buckingham, and brought Buckingham to court, where for twenty-five years he was the wildest and wickedest roué of them all. In 1671 he killed in a duel the Earl of Shrewsbury, whose countess, his paramour, looked on, disguised as a page. When sated with pleasure, he would turn for a change to ambition, and four times his mad freaks lodged him in the Tower. He was mainly instrumental in Clarendon's downfall; was a member of the infamous 'Cabal' (q.v.); and on its break up in 1673 passed over, like Shaftesbury, to the popular side. But crippled with debt, he retired, after Charles's death in 1685, to his manor of Helmsley, in Yorkshire, and amused himself with the chase. He died on 16th April 1687 at Kirby-Moorside, miserably, if not, indeed, 'in the worst inn's worst room.' Buckingham is remembered as the author, or part-author, of several comedies, the wittiest of which, *The Rehearsal* (1671; ed. Summers, 1914), was a travesty of Dryden's tragedies; but he is better remembered as the 'Zimri' of Dryden's *Absalom and Achitophel*. See Life by Lady Burghclere (1903).

Buckingham, JAMES SILK (1786-1855), a farmer's son, was born near Falmouth, went to sea before he was ten, and after years of unsettled life, in 1818 established a journal at Calcutta, the boldness of whose strictures on the Indian government led to his expulsion from Bengal. In London he established the *Oriental Herald* (1824), and the *Athenæum* (1828), now the leading weekly literary journal. Subsequently he travelled through the United States, and from 1832 to 1837

was member for Sheffield. Besides eighteen books of travel, &c., he had published an Autobiography, when he died 30th June 1855. His youngest son, Leicester (1827-65), was a skilful dramatic adapter.

Buckingham Palace, which in 1837 became the ordinary town residence of Queen Victoria, stands on a site devoted by James I. to the growth of mulberries for the promotion of silk-worm-rearing. Under Charles I. Lord Goring became keeper of the mulberry garden, and built Goring House there; later the garden became a place of public entertainment, and by Charles II. was granted to Lord Arlington, who rebuilt Goring House. John Sheffield (q.v.), Duke of Buckingham, bought Arlington House, pulled it down, and in 1698 built Buckingham House in place of it. George III. bought this in 1761 and sometimes lived there. George IV. had it remodelled by Nash in 1825, but it was unoccupied till 1837. See *Royal Palaces of England*, edited by Rait (1911).

Buckinghamshire, or BUCKS, a south-midland county of England, adjoining Bedfordshire, Herts, Middlesex, Surrey, Berks, Oxfordshire, and Northamptonshire, has a maximum length of 57 miles, a varying breadth of $8\frac{1}{2}$ and 27 miles, and an area of 749 sq. m., or 479,366 acres. It is finely diversified with hill and dale, wood and water. To the south is a broad chalk-band, including the Chiltern Hills (q.v.). Sloping north from these hills, and crossed by narrower bands of Greensand and Oolite, is the very fertile vale of Aylesbury, watered by the Thame. The climate is mild and healthy; the soil is mostly good, chalk and clay predominating. Buckinghamshire is eminently an agricultural county, 87 per cent. of the entire area being in cultivation. Wheat is the principal crop. The chief dairy product is butter, which finds a ready sale, chiefly in London. In the vale of Aylesbury, fattening of cattle is extensively carried on; the sheep are noted for their fine and heavy fleeces; and large numbers of ducks are reared for metropolitan consumption. Nearly 40 sq. m. are under woods and plantations, beech and oak being the chief timber-trees. The chief manufactures are paper, straw-plait, and thread-lace. The county returns three members to parliament; Aylesbury, Buckingham, Marlow, and Wycombe having ceased in 1885 to be parliamentary boroughs. Buckinghamshire contains some Roman and British remains, as traces of Watling, Icknield, and Ake-man Streets or Ways; remains of the religious houses of Missenden, Notley, Burnham, Medmenham, and Irvinghoe; and vestiges of Lavendon and Whitechurch Castles. There are many examples of Early English and Decorated architecture; and the church of Chetwode (13th century), near Buckingham, contains some fine examples of ancient glass-staining. Many events of historical interest occurred in this county. It was the scene of contest in the civil wars of Stephen and John. At Chalfont St Giles, Milton finished his *Paradise Lost*, and at Hinton he wrote *L'Allegro*. At Hampden lived the great patriot of that name; Atterbury was born at Milton; Stoke Poges Churchyard suggested Gray's *Elegy*, and is the place of his burial; at Olney, Cowper lived. Beaconsfield Manor was the seat of Waller; Gregories, near Beaconsfield, of Edmund Burke; Bradenham, of the elder D'Israeli; and Hughenden, of the Earl of Beaconsfield. Scott, the biblical commentator, was rector of Aston Sandford; Herschel's great telescope was erected at Slough, where he made most of his important discoveries. Stow House, a magnificent mansion—one of the finest in England, alike for extent, architecture, and beauty of site—became a public school in 1923. Pop. (1801) 108,132; (1881) 176,323; (1911) 219,551; (1921) 236,209. See

histories by Lipscomb (1847), Sheahan (1862); the 'Victoria History' (1905 *et seq.*); Mawe and Stenton, *The Place-names of Buckinghamshire* (1925); and the report on Historical Monuments.

Buckinghamshire. See BUCKINGHAM, SHEFFIELD (JOHN).

Buckland, WILLIAM, D.D., geologist, was born at Tiverton, Devonshire, in 1784. From Winchester he passed in 1801 to Corpus Christi College, Oxford, of which he became a Fellow (1808); and in 1813 he was appointed Oxford reader in Mineralogy. In 1818 he became reader in Geology at Oxford, and was elected Fellow of the Royal Society. In 1822 he received the Copley medal for his account of the Kirkdale Cave (q.v.), which in 1823 he supplemented with *Reliquiae Diluvianae, or Observations on Organic Remains, attesting the Action of a Universal Deluge*, a theory he afterwards saw cause to modify. In 1825 he was appointed a canon of Christ Church, Oxford; in 1832 he was president of the British Association at Oxford; and in 1836 he published his *Bridgewater Treatise, Geology and Mineralogy considered with Reference to Natural Theology*. In 1845 he was made Dean of Westminster; but under his great and continuous labours to benefit others, his mental faculties gave way seven years before his death, which took place August 14, 1856.—His son, FRANCIS TREVELYAN BUCKLAND, was born 17th December 1826, at Christ Church College, Oxford. He was educated at Winchester and Christ Church, and after for five years devoting himself to the study of medicine at St George's Hospital, London, was assistant-surgeon to the 2d Life Guards (1854-63). From his boyhood he manifested an enthusiastic delight in natural history, especially when it could be applied practically to the cultivation of useful quadrupeds, birds, or fish, in which study he was encouraged and guided by his father. He contributed largely to the *Times*, *Field*, *Queen*, and *Land and Water*, which last he started in 1866. He was also author of *Curiosities of Natural History* (4 vols. 1857-72), *Fish-hatching* (1863), *Logbook of a Fisherman and Zoologist* (1876), *Natural History of British Fishes* (1881), and *Notes and Jottings from Animal Life* (1882). He was an acute observer, and his writings on natural history exhibit the results of fresh and original observations in a most interesting manner. He took a great interest in fish-culture, and at his own cost established under the Science and Art Department, South Kensington, a 'Museum of Economic Fish-culture.' In 1867 he was appointed inspector of salmon-fisheries for England and Wales; in 1870 special commissioner on the salmon-fisheries of Scotland; and in 1877 on the Scottish herring-fisheries. He died December 19, 1880. He was not a Darwinian. See his *Life* by G. C. Bompas (1885).

Bucklandia, a magnificent and beautiful ever-green tree of the order Hamamelidæ (see WITCH-HAZEL), a native of the Himalayas, and growing in the island of Sumatra. The timber is not valuable.

Buckle, HENRY THOMAS, was born at Lee, in Kent, 24th November 1821, the son of a London merchant, a Tory and staunch churchman. A sickly child, he was for a very short time at an academy in Kentish-Town; no other school and no university claims credit for his education, which yet was liberal in the highest degree. At the age of eighteen he found himself master of £1500 a year, and by 1850 he knew eighteen foreign languages, and had amassed a library of 22,000 volumes, chosen mostly to help him in a *magnum opus*, which gradually took shape as *The History*

of *Civilisation in England*. The first volume appeared in 1857, the second in 1861; but his health had been meantime shattered by the loss of an idolised mother; and on 29th May 1862, after six months' wandering in Egypt and Palestine, he died of typhoid fever at Damascus. For more than twenty years he had been reckoned one of the first chess-players in the world.

Buckle's plan involved, before tracing the particular history of English civilisation, a general consideration of the progress of those countries, England, France, Germany, Scotland, Spain, and America, in which the elements of modern civilisation are originally found. The two volumes published are occupied with this preliminary examination, which they do not even complete. His objects, however, are clear. They are (1) to discover what is the essential spirit of a nation's history apart from particular men and events, and (2) to trace out the causes of the progress which has been made in England and France. Under the first head he endeavours to show that the spirit or character of a people is determined by material environments, such as soil, climate, food, aspects of nature, and the like; under the second head occurs the theory—whose vigorous application startled and offended many readers—that the progress of society depends upon scepticism; that the retarding force is credulity; and that the excessive 'protection' exercised by governments, the nobility, the church, &c. over the 'people,' has dwarfed and held back the spirit of freedom and civilisation. These and other positions are defended by Buckle with great ingenuity and lucidity of argument and expression, and have been admitted, even by his opponents, to contain much truth. He is accused—not unjustly—of being often one-sided, and of drawing sweeping deductions from an imperfect survey of facts.

See *Miscellaneous and Posthumous Works*, ed. by Miss Taylor (1872; new ed. by Grant Allen, 1885); the *Life* by A. H. Huth (2 vols. 1880); and J. M. Robertson, *Buckle and his Critics* (1895).

Buckles, metal instruments, consisting of a rim and tongue, used for fastening straps or bands in dress, harness, &c. These are made on a very large scale in the neighbourhood of Birmingham. Both brass and iron are used for them, the chief kinds being called tongue, roller, brace, and gear buckles. The use of buckles, instead of shoe-strings, was introduced into England during the reign of Charles II. They soon became very fashionable, attained an enormous size (the largest being called Artois buckles, after the Comte d'Artois, brother of the king of France), and were usually made of silver, set with diamonds and other precious stones. In the latter half of the 18th century the manufacture of buckles was carried on most extensively in Birmingham, there being at one time not less than 4000 people directly employed in that town and its vicinity, who turned out 2,500,000 pairs of buckles annually, the prices ranging from one shilling to five guineas, and even ten guineas a pair. When the trade was at its height, however, fashion changed, and in 1791 we find buckle-makers petitioning the Prince of Wales for sympathy, on the ground that owing to the introduction of shoe-strings and slippers, 20,000 persons were in terrible distress. The prince promised to assist them as far as he could by wearing buckles himself, and enjoining his household to do the same; but fashion was too strong even for him, and before the close of the century a great staple trade of Birmingham had become extinct, though shoe-buckles are still by no means unknown.

Buckram. This name is now applied to a coarse open-woven fabric of cotton or linen made

very stiff with size. It is used for the framework of ladies' bonnets, for the inside of belts and collars of dresses, and for bookbinding. But the buckram of olden times was an entirely different kind of stuff, a fine linen or cotton cloth. (The name *bucranus*, *boquerannus*, &c. in medieval Latin, *boquerant* in Old French, &c., may be from the Arabic.) Rock's Catalogue of Textiles in the South Kensington Museum says: 'All along the middle ages buckram was much esteemed for being costly and very fine, and consequently fit for use in church vestments, and for secular personal wear. Grandison, consecrated Bishop of Exeter in 1327, gave to his cathedral banners of white and red buckram; and three of the rich veils for covering the lectern in that church were lined with blue bokeram. As late as the beginning of the 16th century this stuff was held good enough for lining to a black velvet gown for a queen, Elizabeth of York;' but to most minds it is now familiar through Falstaff's antagonists, the 'rogues in buckram suits.'

Buckskin is a soft leather made of deerskin or sheepskin; also a strong, twilled woollen cloth, cropped of nap and carefully finished. 'Buckskin breeches' are usually of this cloth, not of the leather.

Buckstone, JOHN BALDWIN, comedian and dramatic writer, was born at Hoxton, London, in 1802, and, having in 1822 exchanged an attorney's office for the provincial stage, appeared next year at the Surrey Theatre. His success was so unequivocal that in 1827 he was engaged by the Adelphi Theatre, where he continued till 1833 as leading low comedian. Except for a visit to the United States in 1840, and short engagements at Drury Lane and the Lyceum, he thenceforward played chiefly at the Haymarket, of which he was lessee from 1853 till 1878. He died 31st October 1879. Buckstone's acting was not more noted for its comicality and humour, which never degenerated into vulgarity, than for its distinct appreciation of the peculiar traits in each individual character he assumed. He was also a prolific dramatic author, and of the 150 pieces he wrote for the stage, several have been highly popular.

Buckthorn (*Rhamnus*), a genus of Rhamnaceæ (q.v.), including sixty species, all shrubs or trees, widely distributed through temperate and tropical regions, but absent from Australia.—The Common Buckthorn (*R. cathartica*) is characterised by its spinous and cross-like branchlets, serrate leaves, and yellow-green dioecious flowers. The berries, which are about the size of peas, globular, bluish-black, nauseous, and violently purgative, were formerly much used in medicine, but now more rarely, and only in the form of a syrup prepared from their juice. They supply the Sap Green or Bladder Green of painters. The bark affords a beautiful yellow dye. The buckthorn is sometimes planted for hedges, but is of too straggling a habit.

—The Alder Buckthorn, or Breaking Buckthorn (*R. frangula*), also (wrongly) called Black Alder, or Berry-bearing Alder, is spineless, with oval entire leaves, and small, whitish, axillary flowers. The berries are small and black, and also violently purgative, yet are freely eaten by birds. The charcoal of the wood is light, and is used by gunpowder-makers and called dogwood. The bark, leaves, and berries are used for dyeing. The flowers are peculiarly grateful to bees.—Dyer's Buckthorn (*R. infectoria*) is a low shrub, abundant in the south of Europe, whose unripe fruit yields a brilliant yellow dye. The French Berries, Avignon Berries, or Yellow Berries of dyers, are the fruit of this and other species.—Of North American buckthorns there are, besides the Com-

mon one, six or more peculiar species. The most important is the *R. purshiana* of the north-west Pacific slope (especially south-west Oregon), the

Alder Buckthorn (*Rhamnus frangula*):
a, a flower.

cathartic bark of which is used in medicine under the name of Cascara Sagrada.—The Sea Buckthorn (q.v.; *Hippophae rhamnoides*) is a shrub of a different genus and order (Eleagnaceæ). It is occasionally planted as an ornamental shrub.

Bucku, or **BUCHU**, a Hottentot name common to several small aromatic evergreen rutaceous shrubs of the genus *Barosma* (*Diosma*), natives of the Cape of Good Hope, the leaves of which (*folia Buchu*) have enjoyed considerable medical repute, especially as a diuretic.

Buckwheat (*Fagopyrum esculentum*, or *Polygonum Fagopyrum*) is a native of the basin of the Volga, the shores of the Caspian Sea, and many parts of Central Asia. A recent German authority affirms that there is no authentic mention of it

Buckwheat (*Fagopyrum esculentum*):
a, a flower; b, a seed; c, root.

until 1436 at Mecklenburg, whence it spread over Europe in the following century. It is also said to have been introduced by the Moors into Spain, and

thence to have extended over Europe, or, again, to have been brought to Europe by the Crusaders. The French name *Sarrasin* seems to support these latter traditions. It is cultivated on account of the farinaceous albumen of its seeds, which are used, as grain, for food of man and cattle. It is upright, branched, 1 to 3 feet in height; the leaves are between heart-shaped and arrow-shaped, the flowers pale red, the seed (nut) black and triangular, its angles entire. The resemblance of this seed in form to the beech-nut is supposed to be the reason of the German name *Buchweizen* (lit. 'beech-wheat'), from which the English name is derived. Buckwheat is a very common crop in some parts of Europe and of the United States of North America, but is seldom sown in Britain, except as food for pheasants, as it requires continued dry weather in autumn for profitable harvesting. In north-east Germany, and also in Brittany, buckwheat is valued as a crop, particularly for sandy heaths, moorlands, and other poor soils. It yields abundantly, and requires little manure or attention. Forty bushels or more per acre may be expected, weighing 46 or 48 lb. per bushel; and notwithstanding the resemblance of the seed to grain in its qualities and uses, wheat or any other cereal crop generally succeeds well after buckwheat. The seed is most frequently used in the shape of groats, or made into pottage; in the United States, thin cakes of the flour are a standard food. It is very nutritious, containing about 10 per cent. of gluten and 52 per cent. of starch, besides about 6 per cent. of gum and sugar. It is said to be as good as barley for fattening cattle, and better for horses than oats. But as the seed is covered with a very hard rind or thin shell, it must always be shelled before being given to cattle. Poultry are very fond of it. Beer is sometimes brewed from it, and it yields a spirituous liquor of good quality; indeed, it is frequently used in gin-distilleries. As green fodder, the herbage of the plant is said to be more nutritious than clover; but it is said to act as a narcotic on sheep. Bees delight in its flowers, and in some parts of the United States it is sown on this account. In America the seed is usually sown broadcast over the land, which has been ploughed in autumn or early spring, and well scarified or harrowed. About a bushel and a half of seed per acre is required when sown broadcast, but a bushel is sufficient if drilled with a machine. In the latter case it should not be sown in narrower drills than one foot apart, but two feet is recommended as being better for the succeeding crop, as the wider intervals can be properly cultivated. It should not be sown in England before the middle of May, as the least frost is injurious. When the lower seeds are ripe it should be mown, as they are easily shed out if allowed to stand too long.—Tartarian Buckwheat (*F. tataricum*) is distinguished by the toothed edges of the seeds and its more vigorous growth. It is hardy, and adapted for cold situations, but yields inferior meal, and is reckoned a mere weed in Germany. In Canada, on the other hand, it is much grown; but its use, as well as that of common buckwheat, is thought by many to induce skin disease. *F. emarginatum* is grown in China.—Dyer's Buckwheat is *Polygonum tinctorium*. See POLYGONACEÆ.

Bucolic, a term derived from the Greek, 'belonging to herdsmen,' nearly equal to *Pastoral*, from Latin. It is specially used of a kind of Pastoral Poetry (q.v.). The great bucolic poets were Theocritus, Bion, Moschus; and Virgil's Eclogues are sometimes called *Bucolica*.

Buczacz, a town of Eastern Galicia, on the Stripa, an affluent of the Dniester, 47 miles ENE. of Stanislaw by rail. A treaty of peace between the

Poles and the Turks was signed here in 1672. Pop 13,000, mostly Jews.

Bud. The bud is the rudiment of an axis with its appendages. Starting with the seed, we may trace the continued upgrowth of the primeval bud or plumule in germination. Again, by examination

Fig. 1.—Longitudinal section through the apical region of an upright shoot of *Hippuris vulgaris*:

s, growing point of the stem; b, b, b, the whorled leaves; g, g, the first vessels (the dark parts of the tissue indicate the inner cortex with its intercellular spaces). (After Sachs)

in its axil, which may, at least under exceptional circumstances, vegetate as a new axis or Branch (q.v.), or become developed for reproduction as a flower.

In some hardy shrubs and trees the buds are quite inconspicuous in winter, being so minute as to be hidden under an apical coating of bark (e.g. *Taxodium*, *Philadelphus*); generally, however, the buds are well formed before autumn, and are thus fully exposed to the severity of winter. In a few cases (e.g. species of *Viburnum*, although not the common Guelder Rose) the outer leaves still retain sufficient vitality to expand as the first foliage of spring. In the vast majority of plants, however, the leaves are not so hardy, and the outer ones have thus to be sacrificed for the protection of the rest. Since in any upward-growing axis, the lower and earlier formed appendages tend to grow beyond the embryonic apex with its short internodes, and thus cover it up more or less entirely with its developing higher and younger appendages, the normal form of every bud is thus, as it were, a kind of incipient cabbage; and this overlapping

mode of growth comes to be of the greatest protective usefulness. For the changes of day and night, of weather, and most of all, of the seasons, render the process of growth not continuous but rhythmic; and a growing point has thus latent as well as active periods. During the former, however, the outer appendages are exposed to the climate, and usually present adaptive modifications of great variety and interest, which are known as the *bud-scales*. These are often waterproofed with an exudation of resinous varnish, or warmly lined with an epidermic down.

While, in what may be safely taken as the simplest cases, the bud-scales are modifications of entire leaves (e.g. lilac or rhododendron, fig. 2), in many plants the bud-scale is reduced to the petiole only. This is beautifully shown where a series of gradations survives, as is

very often the case in the horse-chestnut; in opening buds of which it is often possible to trace every step of the reduction of the complete foliage-leaf to the petiolar bud-scale (fig. 3, b). Finally, bud-scales may be derived from stipules, as in the magnolia or

Fig. 3.

a, opening ends of beech, showing stipular bud-scales; b, petiolar bud-scales of horse-chestnut, showing transitions to the two true leaves above.

the beech (fig. 3, a). In all these cases alike, the scales are thrown off by the opening buds in spring, and often carpet the ground like a foreshadowing of autumn.

Buds, as has been said, when other than terminal, are usually axillary to the leaves, and their origin may be traced almost as far back as that of the leaves themselves; this may be conveniently seen in a section of the growing point of the mare's-tail (*Hippuris*, fig. 1). Occasionally, too, the bud forms quite under the base of the leaf-stalk, and is concealed by it until this falls off in autumn (*Platanus*). There is usually only one bud in each axil, yet in many plants 'accessory buds' occur. These may be collateral in position, the middle one being largest, as in some hawthorns, willows, and maples; in other cases, however, they form a vertical series, of which either the lowest, and alone strictly axillary bud, may be largest and strongest, as in some honeysuckles, or the uppermost, as in the *Aristolochia* or the butternut, where, indeed, the main branches are thus extra-axillary.

In many cases buds are also of *adventitious* origin—i.e. may arise quite independently of leaves, from any part of the stem—as is well seen on the trunk of the elm-tree, in pollarded willows, in fact in any tree deprived of its branches, or often even after being felled. This is intelligible when we reflect that at all such points there lies the *Cam-bium* (q.v.) or embryonic layer of cells; in the rarer case of origin of adventitious buds from roots, as in the bramble, we have similarly a *pericambium* (see Root): the most curious and exceptional (yet in a deeper view of cellular physiology the most natural) mode of origin is when the

Fig. 4.—Bryophyllum Leaf, from the edges of which two new plants have budded.

leaf-parenchyma itself retains a sufficiently embryonic character to give rise to new buds without the presence of any specially reproductive cells. This is well seen on the surface of the fronds of certain ferns, and is also experimentally reproduced by gardeners, who often raise young plants from the edges of a Bryophyllum leaf (fig. 4), or from the petiole or wounded surface of a leaf of *Begonia*, by simply placing it on sand in a warm and moist atmosphere.

This passage from ordinary vegetative growth to

that discontinuous growth which we call asexual reproduction, and also that further transition to sexual reproduction (see REPRODUCTION, SEX), is admirably illustrated by the interesting reversions to ordinary bud-growth which these more specialised processes often exhibit in unusually favourable vegetative conditions, or even as a permanent habit. Thus in Ferns (q.v.) we may have the budding of prothallia directly upon the frond in the place of spore-cases, or that of the fern plant directly upon the prothallium in place of archegonia. Again, the reversion of floral to leafy buds occurs more or less completely in many garden-flowers, while in many wild species of Allium the flowers become largely replaced by vegetative buds capable of independent growth. This tendency to bud-independence is also well shown in the bulbils and bulbs of many other allied Liliaceæ; while the multiplication of plants by cuttings of course takes advantage of the same widespread latent possibility of separate bud-life. In the old disputes about the individuality of plants and animals, the bud was in fact often defined as a separate individual, and the tree thus viewed as a mere colony of buds. For the growth of buds, see BRANCH; and for arrangement of leaves in buds, see VERNATION, ESTIVATION, FLOWER.

Budding or gemmation is also a frequent mode of growth in animals. See REPRODUCTION.

Buda (Ger. *Ofen*), a town of Hungary on the right bank of the Danube, now united with Pest or Pesth on the left bank as Budapest (q.v.).

Budæus (the Latinised form of *Guillaume Budé*), the greatest French scholar of his age, who was born in Paris in 1467. His works on philology, philosophy, and jurisprudence display extensive learning, the two best known being the *De Asse et Partibus ejus* (1514), which contains a very thorough investigation into ancient coins, and the *Commentarii Linguae Græcæ* (1519), the basis of all subsequent works in this department. His abilities were manifested not only in literature, but in public business. Louis XII. twice sent him to Rome, and Francis I. also employed him in several negotiations. At Budæus's suggestion, Francis founded the Collège de France, and was also persuaded to refrain from prohibiting printing, which the bigoted Sorbonne had advised in 1533. He was royal librarian at the time of his death, 23d August 1540. He was suspected, not without reason, of a leaning towards Lutheranism. His works were collected in 4 vols. (Basel, 1557). See his *Life* by Rebitté (1846), and E. de Budé (1884); the latter's edition of his *Lettres inédites* (2 vols. 1887); Plattard, *Budé* (1923).

Bu'dapest, the capital of Hungary, and formerly of the Hungarian moiety of the Dual Monarchy, consists of Buda (Ger. *Ofen*) on the right and Pest or Pesth on the left bank of the Danube, the two cities having formed a single municipality since 1872. The two towns are connected by many bridges, a chain bridge (designed by Clark Brothers of England in 1842-49), 1280 feet long, uniting the busiest quarters; another chain bridge built in 1903, a little lower; and others. Pest is essentially a modern place, the growth principally of the 19th century; it has many fine streets and squares, the magnificent quays beside the Danube being the favourite promenades; the buildings are chiefly noteworthy for their substantial appearance and frequently large size. Amongst them may be enumerated the Jewish synagogue (the handsomest place of worship in the city); the parish church (1500) and the Leopold basilica (1851-68); the national museum (after 1850), containing collections of pictures, ethnography, natural history, numismatics, and

antiquities, and a great library; the academy of sciences (1862), with its library; the university (1635), established first at Tyrnau, then at Buda in 1777, and lastly at Pest in 1783, with excellent scientific laboratories, &c., and an extensive library; the custom-house (1870-74); industrial, commercial, and fine art museums; and the magnificent parliament houses and the palace of justice.

Whilst Pest stands on a plain, Buda straggles over small steep hills, and is backed by vine-clad slopes. It is a much older town, its central features being the castle in the citadel (1749-71), with the chapel of St Sigismund, in which are preserved the crown regalia of Hungary and the hand of St Stephen; the Matthias church (13th century); the palaces of the various ministries; the monumental tomb of Gul Babas (1543-48), a Turkish saint; and the national lunatic asylum (1860-68).

Both towns are exceptionally well provided with baths, which are supplied both by the Danube and by numerous natural springs of mineral waters. Some of these last—Hunyadi János, Rákóczy, &c.—are exported in large quantities in bottles. The artesian well in the public garden of Pest has been already referred to under ARTESIAN WELLS. The water-works of Pest were planned and built by the English engineer Lindley in 1868. Both towns possess an unusual number of philanthropic institutions, such as hospitals, asylums, &c. There is in Pest a polytechnic (in Buda, 1846-72), with faculties of chemistry, architecture, agriculture, and engineering. A great number of learned and scientific societies flourish; and there is a music academy. The people are gay and fond of amusement, especially horse-racing and rowing. There are two beautiful public gardens, one in Pest, the other on Margaret Island in the Danube, just above the town. The squares and streets of both Pest and Buda are adorned with many statues of celebrated Hungarians. These figures show the extraordinarily rapid growth of Budapest; pop. (1813) 36,153; (1833) 63,148; (1857) 116,683; (1881) 370,767; (1891) 491,938; (1900) 716,476; (1910) 880,371; (1921) 1,184,616. Of the total in 1910 (including the garrison of 17,000), 85·9 per cent. were Magyars, 9·0 Germans, and 2·3 Slovaks; 59·7 per cent. were Roman Catholics, 23·1 Jews, and 14·8 Protestants. Budapest is the first manufacturing town of Hungary. The making of machinery and agricultural implements, wagons, and ships; the manufacture of spirits, tobacco, beer, gold and silver wares, cutlery, starch, glass, and innumerable other articles; the grinding of corn, washing of wool, and painting, are all prosecuted on a large scale. But the commerce is even more important: immense quantities of corn are brought into the town, and exported farther either as corn or as flour; wool, wine and spirits, oil-seeds and agricultural seeds, hemp, tobacco, plums (from Bosnia and Serbia), honey and wax, bacon, hides, feathers, timber, coal, and manufactured wares are the principal articles of the extensive trade. Vast numbers of swine are fattened and killed in huge yards just outside Pest.

The Romans had a military colony (*Aquincum*) on the site of the modern Buda. In the 13th century there existed here a flourishing German town, Old Buda. This was destroyed by the Mongols in 1241; but it soon recovered from the blow. Buda was regarded as the capital of the country from the middle of the same century down to its capture by the Turks in 1527. From 1541 down to 1686 the Turks held Buda, though it was besieged half-a-dozen times by the Austrians. Pest meanwhile was reduced to a heap of ruins; and it did not begin to recover until the first quarter of the 18th century. A century later it was rapidly out-

stripping its twin-sister Buda, which now lags far behind. Budapest was occupied by the Rumanians in August 1919. French, British, and Americans arrived later.

Budaun, a town of India, 140 miles NW. of Lucknow, giving name to a British district of the Rohilkhand division of the United Provinces. Pop. 38,000.—The district, a level, fertile tract on the Ganges and its tributaries, contains an area of just under 2000 sq. m.; pop. 1,000,000, six-sevenths Hindus.

Budayya, a town in the north of Bahrein. See BAHREIN ISLANDS.

Budd, GEORGE, physician, born in February 1808 at North Tawton, Devonshire, studied at Cambridge, and was a fellow of Caius College. He was professor of medicine in King's College, London (1840-63), and after practising privately retired to Barnstaple in 1867, and died 14th March 1882. He wrote on cholera, scurvy, and diseases of the stomach and liver.

Budd, WILLIAM, physician, younger brother of George Budd (q.v.), was born at North Tawton in September 1811. He studied in London, Edinburgh, and Paris, practised in Bristol, and died at Clevedon, 9th January 1880. Besides an important work on typhus, he wrote on cholera, cattle-plague, and other subjects.

Budde, KARL FERDINAND REINHARD, born at Bensberg, near Cologne, 1850, was professor at Bonn, Zurich, Strassburg, and (from 1900) Marburg, rector of the university 1910. He wrote *Die Biblische Urgeschichte*, a work on Samuel and Judges, commentaries and translations.

Buddeus, JOHANN FRANZ, Lutheran theologian and scholar, was born, a pastor's son, at Anklam, Pomerania, 25th June 1667. He studied at Greifswald and Wittenberg, taught Greek and Latin at Coburg, was professor of moral philosophy at Halle (1693), and of theology at Jena (1705). He died at Gotha 29th November 1729. His many writings include *Historia Ecclesiastica Veteris Testamenti* (1709-20), works on moral and dogmatic theology, philosophy, the law of nature and of nations, and an *Allgemeines historisches Lexikon* (1709 et seq.).

Buddha is at once one of the names of the founder of Buddhism (otherwise called Siddharta, Gautama, Sakyamuni), and a general name for any one of a series of teachers of whom he is reckoned one. See BUDDHISM; also BARLAAM AND JOSAPHAT.

Buddhaghosa, a notable Buddhist writer, born about A.D. 390 at Buddh Gaya. He went to study at Anuradhapura, and translated the Singhalese commentaries into Pali. Part of his translation has been edited by Rhys Davids and Carpenter (1886). He wrote much else.

Buddh Gaya, BUDH GAYA, or BODH GAYA, a village of Bihar, 6 miles S. of Gaya, one of the holiest places of Buddhism (q.v.), has many temples (ruined and restored) and sculptures. In the courtyard of one temple is a descendant of the Bo-tree (q.v.) under which Siddharta became the Buddha.

Buddhism. The religion known as Buddhism (from the title of 'The Buddha,' meaning 'the awakened,' 'the enlightened,' acquired by its founder) has existed now for perhaps 2400 years, and is, as regards the number of its adherents, the prevailing religion of the world. In India, the land of its birth, it has now little hold, except among the Nepalese and some other northern tribes; but it bears full sway in Ceylon and over the whole Indo-Chinese Peninsula; it divides the adherence of the Chinese with the systems of Confucius and Lao-tse, claiming perhaps a majority of the population; it prevails also in Japan (although

not the established religion); and, north of the Himalayas, it is the religion of Tibet (where it assumes the form of Lamaism), of the Mongolian population of Central Asia and Southern Siberia, and of the Tatar tribes on the Lower Volga. Its adherents are estimated at more than 500 millions—or about a third of the whole human race. Yet, till towards the middle of the 19th century, nothing was known in Europe respecting the nature and origin of this world-religion, beyond the vaguest notices and conjectures. About the year 1828 B. H. Hodgson, British resident at the court of Nepal, where Buddhism prevails, discovered the existence of a large set of writings in the Sanskrit language, forming the national canonical books. These books were afterwards found to be the texts from which the Buddhist scriptures of Tibet, Mongolia, and China must have been translated. The books of the Ceylon Buddhists are in the language called Pali; and though not translations of the Nepalese standards, they are found to agree with them in substance, and to be only another and somewhat later version of the same traditions. Translations from the Ceylon standards are used by the Buddhists of Burma and Siam. Copies of the Sanskrit books of Nepal, having been sent by Hodgson to the Asiatic Societies of London and Paris, engaged the attention of the great orientalist, Eugène Burnouf, who published in 1844 his *Introduction à l'Histoire du Bouddhisme Indien*; and this book may be said to have been the beginning of anything like correct information on the subject among the western nations.

The most diverse opinions had previously prevailed as to the time and place of the origin of Buddhism. Some looked upon it as a relic of what had been the original religion of India, before Brahmanism intruded and drove it out; a relic of a widespread primeval worship, whose ramifications they endeavoured to trace by identifying Buddha with the Odin of the Scandinavians, the Thoth or Hermes of the ancient Egyptians, and other mythological personages. Others held that it could not be older than Christianity, and must have originated in a blundering attempt to copy that religion—so striking are the many points of resemblance that present themselves. Although the materials are still wanting for a circumstantial history of Buddhism, the main outline is no longer doubtful. Oriental scholars now generally concur in fixing the date of its origin some time in the 5th century B.C., and in making it spring up in the north of India. According to the Buddhist books, the founder of the religion was a prince of the name of Siddhartha, son of Suddhodana, king of Kapilavastu, which is placed somewhere on the confines of Oudh and Nepal. He is often called Sakya, which was the name of the family, or Sakya-muni—i.e. the Sakya sage—and also Gautama, the name of the great 'solar' race of which the family was a branch. To Gautama is frequently prefixed *Sramana*, meaning *ascetic*. Of the names, or rather titles, given to Siddhartha in his state of perfection, the most important is the *Buddha*, which is from the root *budh*, 'to awake,' 'to know,' and which in this connection means 'he who is liberated from existence by the knowledge of the truth;' it is indicative of the leading doctrine of his system. Others are—'The Blessed' (*Bhagavat*); 'the King of Righteousness' (*Dharmaraja*); 'the Conqueror' (*Jina*), &c. The history of Buddha is overlaid with a mass of extravagant and incredible legend; and H. H. Wilson thought it doubtful whether the Buddha was an actual historical personage, and not rather an allegorical figure. Séart and Kern sought to show that the Buddha of the legend is the sun-god, and that the

details of his life have been taken from solar mythology, and that the whole has been modified under the influence of the monastic ideas amid which the legend grew up, though they allowed that Buddhism had a human founder. Few orientalists are prepared to follow them.

The Founder.—Assuming that the Buddha was a real person, and that there is a basis of fact under the mass of extravagant fable with which he is surrounded, the history of Buddhism may be thus briefly outlined: The Prince Siddhartha gives early indications of a contemplative, ascetic disposition; and his father, fearing lest he should desert his high station as Kshatriya (see CASTE and INDIA) and ruler, and take to a religious life, has him early married to a charming princess, and surrounded with all the splendour and dissipation of a luxurious court. Twelve years spent in this environment only deepen the conviction that all that life can offer is vanity and vexation of spirit. He is constantly brooding over the thought that old age, withered and joyless, is fast approaching; that loathsome or racking sickness may at any moment seize him; that death will at all events soon cut off all present sources of enjoyment, and usher in a new cycle of unknown trials and sufferings. These images hang like Damocles' sword over every proposed feast of pleasure, and make enjoyment impossible. He therefore resolves to try whether a life of austerity will not lead to peace; and, although his father seeks to detain him by setting guards on every outlet of the palace, he escapes, and begins the life of a religious mendicant, being now about thirty years old. To mark his breaking off all secular ties, he cuts off the long locks that were a sign of his high caste; and as the shortened hair turned upwards, he is always represented in pictures with curly hair. He commences by studying all that the Brahmins can teach him, but finds their doctrine unsatisfactory. Six years of rigorous asceticism are equally vain; and resolving to return to a more genial life, he is deserted by his five disciples, and then undergoes a fierce temptation from the demon of wickedness. But no discouragement or opposition can divert Sakya-muni from the search after deliverance. He will conquer the secret by sheer force of thinking. He sits for weeks plunged in abstraction, revolving the causes of things. If we were not born, he reflects, we should not be subject to old age, misery, and death; therefore the cause of these evils is birth. But whence comes birth or continued existence? Through a long concatenation of intermediate causes, he arrives at the conclusion that ignorance is the ultimate cause of existence; and therefore, with the removal of ignorance, existence and all its anxieties and miseries would be cut off at their source. Passing through successive stages of contemplation, he realises this in his own person, and attains the perfect wisdom of the Buddha. The scene of this final triumph received the name of Bodhimanda ('the seat of intelligence'), and the tree under which he sat was called Bodhidruma ('the tree of intelligence'), whence Bo-tree. The Buddhists believe the spot to be the centre of the earth. Twelve hundred years after the Buddha's death, Hwen-Thsang, the Chinese Pilgrim, found the Bodhidruma—or a tree that passed for it—still standing. Although the religion of Buddha is extinct in the neighbourhood, there are, 6 miles from Gaya town, in Bihar, extensive ruins and a 14th-century temple (partially restored since 1878), which are believed to mark the place. Within the temple courtyard is a pipal-tree, which claims to be the lineal descendant of the original Bo-tree. See BO-TREE.

Having arrived at the knowledge of the causes of misery, and of the means by which these causes

are to be counteracted, the Buddha was now ready to lead others on the road of salvation. It was at Benares that he first preached, or, in the consecrated phrase, 'turned the wheel of the law.' (This expression comes from one of the titles of the Buddha, *chakravartin*, 'a monarch,' being taken in its etymological sense—i.e. 'the turner of a wheel;') hence, too, have arisen, probably, those praying-wheels seen standing before Buddhist monasteries in Tibet and elsewhere. The doctrines of Buddha are inscribed on the wheel, which is then set in motion by a windlass, or even by horse-power. The individual monks have portable ones, with which they perform their devotions.) But the most important of his early converts was Bimbisara, the sovereign of Magadha (Bihar), whose dynasty continued for many centuries to patronise the new faith. During the forty years that the Buddha continued to preach his strange gospel, he appears to have traversed great part of Northern India, combating the Brahmins, and everywhere making numerous converts. He died at Kusinagara (in Oudh), at the age of eighty; and his body being burned, the relics were distributed among nine communities of believers, and tumuli erected to preserve them (see TOPE). One of these was discovered in 1898 in Basti district; others in the 20th century near Peshawar, at Mirpur Khas (40 miles E. of Haidarabad), and at the ruins of Taxila (near Rawalpindi)—all apparently in their original shrines and settings.

History of the Order.—The Buddha had written nothing himself; but his chief followers assembled in council immediately after his death to settle the rules and doctrines of the order. About a hundred years later, a second council was held to vindicate these against innovators who seceded and held a rival council. In the reign of Asoka, in 244 B.C., there was a third, in which the canon seems to have been fixed more accurately. Some 150 years later it was reduced to writing, apparently in its present form. These canonical writings are divided into three classes, forming the Tripitaka, or 'triple basket.' The first class consists of the *Sutras*, or discourses of the Buddha for the laity; the second contains the *Vinaya*, or discipline for the order; and the third the *Abhidharma*, or metaphysics. The first is evidently the fundamental text out of which all the subsequent writings have been elaborated. The Buddhist religion early manifested a zealous missionary spirit; and princes and even princesses became devoted propagandists. A prince of the royal House of Magadha, Mahindo, carried the faith to Ceylon immediately after the last council, whence it spread to Burma, 450 A.D., and Siam, 638 A.D. The Chinese annals speak of a Buddhist missionary as early as 217 B.C.; and the doctrine made such progress that in 65 A.D. it was acknowledged by the Chinese emperor as a third state religion. The Chinese Buddhists have always looked on India as their 'holy land;' and, beginning with the 4th century of our era, a stream of Buddhist pilgrims continued to flow from China to India during six centuries. Several of these pilgrims have left accounts of their travels, which throw a light on the course of Buddhism in India, and on the internal state of the country in general, that is looked for in vain in the literature of India itself (see HWEN-THSANG). As to the spread of Buddhism north of the Himalayan Mountains, we have the historical fact that a Chinese general, having about the year 120 B.C. defeated the barbarous tribes to the north of the Desert of Gobi, brought back as a trophy a golden statue of the Buddha.

A prominent name in the history of Buddhism is that of Asoka (q.v.), king of Magadha, in the 3d century B.C., whose sway seems to have extended over the whole peninsula of Hindustan, and even

over Ceylon. This prince was to Buddhism what Constantine was to Christianity. He was at first a persecutor of the faith, but being converted—by a miracle, according to the legend—he became its zealous propagator. Not, however, as princes usually promote their creed; for it is a distinguishing characteristic of Buddhism that it has never employed force, hardly even to resist aggression. Asoka showed his zeal by building and endowing viharas or monasteries, and raising topes and other monuments over the relics of Buddha and in spots remarkable as the scenes of his labours. Hwen-Thsang, in the 7th century of our era, found topes attributed to Asoka from the foot of the Hindu Kush to the extremity of the peninsula. The pillar erected by him on the site of the garden at Kapilavastu, about 100 miles N. of Benares, where Buddha was born, was discovered. There exist, also, in different parts of India, edicts inscribed on rocks and pillars, inculcating the doctrines of Buddha. The edicts are in the name of King Piyadasi; but orientalists are almost unanimous in holding Piyadasi and Asoka to be one and the same. A remarkable spirit of charity and toleration runs through these royal sermons. The 'king beloved of the gods' desires to see the ascetics of all creeds living in all places, for they all teach the essential rules of conduct. 'A man ought to honour his own faith only; but he should never abuse the faith of others. . . . There are even circumstances where the religion of others ought to be honoured, and in acting thus, a man fortifies his own faith, and assists the faith of others.' The next name of importance after Asoka is that of Kanishka (10 A.D.), king of North-western India, under whose direction a council was held for a fresh revision of the canon. It seems to have been shortly after this that the Buddhists broke up into two schools—viz. the 'Lesser Vehicle,' or conservative party, formed by the southern Buddhists, and the 'Greater Vehicle,' or progressive party, embracing the Buddhists of the north.

For the glimpses we get of the state of Buddhism in India, we are indebted chiefly to the accounts of Chinese pilgrims. Fa-hian, at the end of the 4th century, found some appearances of decline in the east of Hindustan, its birthplace, but it was still strong in the Punjab and the north. In Ceylon, it was flourishing in full vigour, the ascetics or monks numbering from 50,000 to 60,000. In the 7th century—i.e. 1200 years after the death of the Buddha—Hwen-Thsang represents it as widely dominant and flourishing, and patronised by the powerful Siladitya, king of Kanoj, who held a council at which the doctrines of the Little Vehicle were condemned. Its history was doubtless more or less checkered. The Brahmins, though little less tolerant than the followers of Buddha, seem to have been in some cases roused into active opposition; and some princes employed persecution to put down the new faith.

It was probably during the first four or five centuries of our era, and as a result of persecution, that Buddhists, driven from the great cities, retired among the hills of the west, and there constructed those cave-temples which, for their number, vastness, and elaborate structure, continue to excite the wonder of all who see them. There are reckoned to be not fewer than 900 Buddhist excavations still extant in India, nearly all within the presidency of Bombay. The destruction of Buddhism in India seems to have been brought about largely by internal corruption, but most of all by the Mohammedan invasion. For several centuries we have notices of it as existing in Kashmir, Bengal, and the Deccan, till it at last disappears in Orissa in the middle of the 16th century.

What, then, is the nature of this faith, which has

been for so long, and is still, the sole light of so many millions of human beings? In answering this question, we must confine ourselves here to a brief outline of the intellectual theory on which the system is based, and of the general character of its morality and ritual observances, as they were conceived by the founder and his more immediate followers; referring for the various forms which the external observances have assumed to the several countries where it is believed and practised. See BURMA, CEYLON, CHINA, JAPAN, LAMAISM.

The Doctrine.—Buddhism is based on the same views of human existence, and the same philosophy of things in general, that prevailed among the Brahmins, although it was a reaction against their hierarchy. It accepts without questioning the doctrine of the transmigration of souls, which lies at the root of so much that is strange in the Indian character. For a fuller account of this important doctrine, the reader is referred to REINCARNATION; while the peculiar cosmogony or system of the universe with which it is associated, and which is substantially the same among Hindus and Buddhists, is described under INDIA (*Religion*). It is sufficient here to say that, according to Buddhist belief, when a man dies he is immediately born again, or appears in a new shape; and that shape may, according to his merit or demerit, be any of the innumerable orders of being composing the Buddhist universe—from a clod to a divinity. If his demerit would not be sufficiently punished by a degraded earthly existence—in the form, for instance, of a woman or a slave, of a persecuted or a disgusting animal, of a plant, or even of a piece of inorganic matter—he will be born in some one of the 136 Buddhist hells. These places of punishment have a regular gradation in the intensity of the suffering and in the length of time the sufferers live, the least term of life being ten millions of years, the longer terms being almost beyond the powers of even Indian notation to express. A meritorious life, on the other hand, secures the next birth, either in an exalted and happy position on earth, or as a blessed spirit, or even divinity, in one of the many heavens; in which the least duration of life is about ten billions of years. But however long the life, whether of misery or of bliss, it ends when the *karma* is exhausted, and the individual must be born again, and may again be either happy or miserable—either a god, or it may be, the vilest inanimate object. One legend makes Bhagavat, in order to impress upon the monks of a monastery the importance of their duties, point to a besom, and, by his supernatural insight, reveal to them that it had once been a novice who had been negligent in sweeping the hall of assembly; the walls and pillars, again, he told them, had once existed as monks, who soiled the walls of the hall by spitting upon them. The Buddha himself, before his last birth as Sakya-muni, had gone through every conceivable form of existence on the earth, in the air, and in the water, in hell and in heaven, and had filled every condition in human life. When he attained the perfect knowledge of the Buddha, he was able to recall all these existences; and that part of the Buddhist legendary literature called the Jatakas narrates his exploits when he lived as an elephant, as a bird, as a stag, and so forth.

The Buddhist conception is peculiar of the way in which the quality of actions—which is expressed by the word *karma* ('doing'), including both merit and demerit—determines the future condition of all sentient beings. They do not conceive any god or gods as being pleased or displeased by the actions, and as assigning the actors their future condition by way of punishment or of reward. The very idea of a god, as creating or in any way

ruling the world, is utterly absent in the Buddhist system. God is not so much as denied: he is simply not known. Contrary to the opinion once confidently and generally held, that a nation of atheists never existed, the Buddhist peoples are essentially atheist; for they know no beings with greater supernatural power than any man is supposed capable of attaining to by virtue, austerity, and science. Indeed some of the Buddhist nations—the Chinese, Mongols, and Tibetans—have no word in their languages to express the notion of God as supreme ruler. The future condition of the Buddhist, then, is not assigned him by the Ruler of the universe; his *karma* determines it by a sort of virtue inherent in the nature of things—by the blind and unconscious concatenation of cause and effect. But the laws by which consequences are regulated seem dark, and even capricious. A bad action may lie dormant, as it were, for many existences; the taint, however, is there, and will some time or other break out. A Buddhist is thus never at a loss to account for any calamity that may befall himself or others.

Another basis of Buddhism is the assumption that human existence is on the whole miserable, and a curse rather than a blessing (see PESSIMISM). This notion, or rather feeling, is, like transmigration, common to Buddhism and Brahmanism, and is even more prominent in Buddhism than in the old faith. It is difficult for a European to conceive this state of mind, or to believe that it can be habitual in a whole people; and many signal errors in dealing with the Indian nations have arisen from overlooking the fact. The cause would seem to lie largely in the comparatively feeble physical organisation of Easterns in general, together with that want of security and peace, and that habitual oppression of the many by the few, with all the attendant degradation and positive suffering, which was long the normal state of things in India. The little value that Hindus set upon their lives is manifested in many ways. The punishment of death has little or no terror for them, and is even sometimes coveted as an honour. For, in addition to the little value of their present existence, they have the most undoubting assurance that their soul, if dislodged from its present tenement, will forthwith find another, with a chance, at least, of its being a better one.

In the eyes, then, of the Sakya-muni and his followers, sentient existence was hopelessly miserable. Misery was not a mere taint in it, the removal of which would make it happy; misery was its very essence. Death was no escape from this inevitable lot; for, according to the doctrine of transmigration, death was only a passage into some other form of existence equally doomed. Even the heaven and the state of godhead which form part of the cycle of changes in this system were not final; and this thought poisoned what happiness they might be capable of yielding. Brahman philosophers had sought escape from this endless cycle of unsatisfying changes by making the individual soul be absorbed in the universal spirit (see BRAHMA). Gautama had the same object in view—viz. exemption from being born again; but he declared the Brahmanic penances inadequate to accomplish this. His philosophy was utterly atheistic, like that of the original Sankhya school of philosophy, with which it is most closely connected, and ignored a supreme God or Creator; it did not leave even an impersonal spirit of the universe into which the human soul could be absorbed. Gautama sees no escape but in what he calls Nirvana, the exact nature of which has been matter of dispute. According to its etymology, the word means 'extinction,' 'blowing out,' as of a candle; and in the

Buddhist scriptures generally it is equivalent to the cessation of individual existence. Even in those schools which have attempted to draw a distinction, the distinction is of the most evanescent nature.

The key of the whole scheme of Buddhist salvation lies in what Gautama called his Four Sublime Verities. The first asserts that pain exists; the second, that the cause of pain is desire or attachment—the meaning of which will appear further on; the third, that pain can be ended by Nirvana; and the fourth shows the way that leads to Nirvana. This way to Nirvana consists in eight things: right views, right feelings, right words, right behaviour, right exertion, right obedience, right memory, and right meditation. The immediate cause of pain is birth, for if we were not born we should not be exposed to death or any of the ills of life. Birth, again, is caused by previous existence; it is only a transition from one state of existence into another. A sentient being consists of an assemblage of material qualities, sensations, ideas, tendencies, and mental powers, none of which are permanent, but dissolve at death. What alone is permanent is the being's *karma*. It does not die. But for it there would be freedom from existence. The cause of existence is a 'grasping state of mind,' or attachments, good and bad. These depend upon desire. We thus arrive at desire—including both the desire to possess and the desire to avoid—as one link in the chain of causes of continued existence and pain. Desire is said to be caused by sensation, sensation by contact, and so on until we come to ideas. Ideas, however, are mere illusions, the results of ignorance or error, attributing durability and reality to that which is transitory and imaginary. Cut off this ignorance, bring the mind into a state in which it can see and feel the illusory nature of things, and forthwith the whole train vanishes; illusory ideas, distinction of forms, senses, contact, sensation, desire, attachment, existence, birth, misery, old age, death!

Morality and Religious Observances.—The eight parts or particulars constituting the theoretical 'way' (to Nirvana), were developed by Gautama into a set of practical precepts enjoining the various duties of common life and of religion. They are all ostensibly intended as means of counteracting or destroying the chain of causes that tie men to existence and necessitate being born again, especially that most important link in the chain constituted by the attachments or desires resulting from former actions; although the special fitness of some of the precepts for that end is far from being apparent. It is easy to understand how the austerities that are prescribed might subdue the passions and affections, and lessen the attachment to existence; but how the exercise of benevolence, of meekness, of regard to truth, of respect to parents, &c. on which Gautama laid so much stress, should have this effect, it is difficult to conceive. Luckily for the Buddhist world, Gautama's moral nature was better than his logic; and as he felt strongly that these things are essentially right and good, he takes it for granted that they must contribute to what was in his eyes the chief good—escape from existence, or Nirvana. In delivering his precepts, the Buddha considers men as divided into two classes—those who have embraced the religious life (*Sramanas*), and those who continue in the world, or are laymen. These last are considered as too much attached to existence to feel any desire or have any hope of emancipation, at least at this stage. But there are certain precepts which it is necessary for all to obey, that they may not bring greater misery upon themselves in their next births, and rivet the bonds of existence more indissolubly.

There are ten moral precepts or 'precepts of aversion.' Five of these are of universal obligation—viz. not to kill; not to steal; not to commit adultery; not to lie; not to be drunken. Other five are for those entering on the direct pursuit of Nirvana by embracing the religious life: to abstain from food out of season—that is, after mid-day; to abstain from dances, theatrical representations, songs, and music; to abstain from personal ornaments and perfumes; to abstain from a lofty and luxurious couch; to abstain from taking gold and silver. For the regular ascetics or monks there are a number of special observances of a very severe kind. They are to dress only in rags, sewed together with their own hands, and to have a yellow cloak thrown over the rags. They are to eat only the simplest food, and to possess nothing except what they get by collecting alms from door to door in their wooden bowl. They are allowed only one meal, and that must be eaten before mid-day. For a part of the year, they are to live in forests, with no other shelter than the shadow of a tree, and there they must sit on their carpet even during sleep, to lie down being forbidden. They are allowed to enter the nearest village or town to beg food, but they must return to their forests before night.

Besides the absolutely necessary 'aversions and observances' above mentioned, the transgression of which must lead to misery in the next existence, there are certain virtues or 'perfections of a supererogatory or transcendent kind, that tend directly to 'conduct to the other shore' (Nirvana). The most essential of these are almsgiving or charity, purity, patience, courage, contemplation, and knowledge. Charity or benevolence may be said to be the characteristic virtue of Buddhism—a charity boundless in its self-abnegation, and extending to every sentient being. The benevolent actions done by the Buddha himself, in the course of his many millions of migrations, were favourite themes with his followers. On one occasion, seeing a tigress starved and unable to feed her cubs, he hesitated not to make his body an oblation to charity, and allowed them to devour him. Benevolence to animals, with that tendency to exaggerate a right principle so characteristic of the East, is carried among the Buddhist monks to the length of avoiding the destruction of fleas and the most noxious vermin, which they remove from their persons with all tenderness.

There are other virtues of a secondary kind, though still highly commendable. Thus, not content with forbidding lying, the Buddhist strictly enjoins the avoidance of all offensive and gross language, and of saying or repeating anything that can set others at enmity among themselves; it is a duty, on the contrary, especially for a *sramana*, to act on all occasions as a peacemaker. Patience under injury, and resignation in misfortune, are strongly inculcated. Humility, again, holds a no less prominent place among Buddhist graces than it does among the Christian. The Buddhist saints are to conceal their good works, and display their faults. As the outward expression of this sentiment of humility, Gautama instituted the practice of confession. Twice a month, at the new and at the full moon, the monks confessed their faults aloud before the assembly. If these were slight, some slight penance was imposed, such as sweeping the courtyard of the monastery. This humiliation and repentance seems the only means of expiating sin that was known to Gautama. Confession was exacted of all believers, only not so frequently as of the monks. The edicts of Piyadasi recommend a general and public confession at least once in five years.

Such are the leading features of the moral code of the Buddha, of which it has been said that 'for puerility, excellence, and wisdom, it is second only to that of the Divine Lawgiver himself.' But the original morality of Buddhism has, in the course of time, been disfigured by many subtleties, puerilities, and extravagances, derived from the casuistry of the various schools of later times; just as the casuistry of the Jesuits, for instance, perverted many of the precepts of Christianity. The theory on which the Buddha founds his whole system gives, it must be confessed, only too much scope to such perversions; for, on that theory, truth is to be spoken, self to be sacrificed, benevolence to be exercised, not for the sake of the good thus done to others, but solely for the effect of this conduct on the soul of the actor, in preparing him for escape from existence. To teach men 'the means of arriving at the other shore' was another expression for teaching virtue; and that other shore was annihilation. On this principle, the Buddhist casuist can, like the Jewish, render of none effect the universal law of charity and the duty of respecting and aiding parents, on which the Buddha laid such stress. Thus, a Bhikshu—i.e. one who has engaged to lead a life of self-denial, celibacy, and mendicancy, and is thus on the high-road to Nirvana—is forbidden to look at or converse with a female, lest any disturbing emotion should ruffle the serene indifference of his soul; and so important is this, that 'if his mother have fallen into a river, and be drowning, he shall not give her his hand to help her out; if there be a pole at hand, he may reach that to her; but if not, she must drown' (Wilson).

Contemplation and science or knowledge (i.e. of the concatenation of causes and effects) are ranked as virtues in Buddhism, and hold a prominent place among the means of attaining Nirvana. It is reserved, in fact, for abstract contemplation to effect the final steps of the deliverance. Thought is the highest faculty of man, and, in the mind of an Eastern philosopher, the mightiest of all forces. A king who had become a convert to Buddhism is represented as seating himself with his legs crossed and his mind collected; and 'cleaving with the thunderbolt of science the mountain of ignorance,' he saw before him the desired state. It is in this cross-legged, contemplative position that Sakya-muni is almost always represented in that crowning intellectual act of his, when, seated under the Bo-tree, he attained the full knowledge of the Buddha, saw the illusory nature of all things, broke the last bonds that tied him to existence, and stood delivered for evermore from the necessity of being born again.

'Complete' Nirvana or extinction cannot, of course, take place till death; but this state of preparation for it, called simply Nirvana, seems attainable during life, and was, in fact, attained by Gautama himself. The process by which the state is attained is called *Dhyana*, and is neither more nor less than ecstasy or trance, which plays so important a part among mystics of all religions. The individual is described as losing one feeling after another, until perfect apathy is attained, and he reaches a region 'where there are neither ideas, nor the idea of the absence of ideas!'

The ritual or worship of Buddhism—if worship it can be called—is very simple in its character. There are no priests or clergy properly so called. The *Sramanas* or *Bhikshus* (mendicants) are simply a religious order—a kind of monks who, in order to the more speedy attainment of Nirvana, have entered on a course of greater sanctity and austerity than ordinary men; they have no sacraments to administer or rites to perform for the people, for every Buddhist is his own priest. The only thing

like a clerical function they discharge, is to read the scriptures or discourses of the Buddha in stated assemblies of the people held for that purpose. They have also everywhere, except in China, a monopoly of education; and thus in Buddhist countries education, whatever may be its quality, is very generally diffused. In some countries, the monks are exceedingly numerous; around Lassa in Tibet, for instance, they are said to be one-third of the population. They live in *vikharas* or monasteries, and subsist partly by endowments, but mostly by charity. Except in Tibet, they are not allowed to engage in any secular occupation. The vow is not irrevocable. This incubus of monachism constitutes the great weakness of Buddhism in its social aspect. See BURMA, CHINA, JAPAN, LAMAISM, &c.

The adoration of the statues of the Buddha and of his relics is the chief external ceremony of the religion. This, with prayer and the repetition of sacred formulas, constitutes the ritual. The centres of the worship are the temples containing statues, and the *topes* or *tumuli* erected over the relics of the Buddha, or of his distinguished apostles, or on spots consecrated as the scenes of the Buddha's acts. The central object in a Buddhist temple, corresponding to the altar in a Roman Catholic church, is an image of the Buddha, or a *dagoba* or shrine containing his relics. Here flowers, fruit, and incense are daily offered, and processions are made with singing of hymns. The quantity of flowers used as offerings is prodigious. A royal devotee in Ceylon, in the 15th century, offered on one occasion 6,480,320 flowers at the shrine of the tooth. At one temple it was provided that there should be offered 'every day 100,000 flowers, and each day a different flower.' Of the relics of the Buddha, the most famous are the *teeth* that are preserved with intense veneration in various places. Hwen-Thsang saw more than a dozen of them in different parts of India; and the great monarch Siladitya was on the eve of making war on the king of Kashmir for the possession of one, which was in consequence given up. The tooth of the Buddha preserved in Ceylon, a piece of ivory about the size of the little finger, is exhibited very rarely. See CEYLON.

There appears at first sight to be an inconsistency between this seeming worship of the Buddha and the theory by which he is considered as no longer existing. Yet the two things are really not irreconcilable; not more so, at least, than theory and practice often are. With all their admiration of the Buddha, his followers have never made a god of him. Gautama is only the last Buddha—the Buddha of the present cycle. He had predecessors in the cycles that are past (twenty-four Buddhas of the past are enumerated, and Gautama could even tell their names); and when, at the end of the present cycle, all things shall be reduced to their elements, and the knowledge of the way of salvation shall perish with all things else, then, in the new world that shall spring up, another Buddha will appear, again to reveal to the reascent beings the way to Nirvana. Gautama foretold that Mitrera, one of his earliest adherents, should be the next Buddha (the Buddha of the future), and he gratified several of his followers with a like prospect in after-cycles. The Buddha was thus no greater than any mortal may aspire to become. The prodigious and supernatural powers which the legends represent him as possessing are quite in accordance with Indian ideas; for even the Brahmins believe that by virtue, austerities, and science, a man may acquire power to make the gods tremble on their thrones. One who is on the way to become a supreme Buddha, and has arrived at that stage when he has only one more birth to undergo, is

styled a *Bodhisatva* (having the essence of knowledge); a mere candidate for Nirvana is an *arhat* (venerable).

The Buddha, then, is not a god; he is the ideal of what any man may become; and the great object of Buddhist worship is to keep this ideal vividly in the minds of the believers. In the presence of the statue, the tooth, or the footprint, the devout believer vividly recalls the example of him who trod the path that leads to deliverance. This veneration of the memory of Buddha is perhaps hardly distinguishable among the ignorant from worship of him as a present god; but in theory, the ritual is strictly commemorative, and does not necessarily involve idolatry any more than the garlands laid on the tomb of a parent by a pious child. See TOPE.

The prayers addressed to the Buddha are more difficult to reconcile with the belief in his having ceased to exist. It is improbable, indeed, that the original scheme of Buddhism contemplated either the adoration of the statues of the Buddha or the offering of prayers to him after his death. These are an after-growth—accretions upon the simple scheme of Gautama, and in a manner forced upon it during its struggle with other religions. For a system of belief that seeks to supplant other systems finds itself enticed to present something to rival and outdo them, if possible, in every point. Even the Christian church in the middle ages adopted with this view rites and legends of paganism; merely casting over them a slight disguise, and giving them Christian names. Prayer, too, is natural to man. And then the inconsistency of uttering prayers when there is no one to hear or answer, glaring as it may appear to some, is by no means great to the Eastern mind. Prayers, like other sacred formulas, are conceived less as influencing the will of any superior being to grant the request, than as working in some magical way—producing their effects by a blind force inherent in themselves. They are, in short, mere incantations or charms. Even the prayers of a Brahman, who believes in the existence of gods, do not act so much by inclining the deity addressed to favour the petitioner, as by compelling him through their mysterious potency—through the operation of a law above the will of the highest gods. The Buddhist, then, may well believe that a formula of prayer in the name of 'the Venerable of the world' will be potent for his good in this way, without troubling himself to think whether any conscious being hears it or not.

The element in Buddhism which more than any other, perhaps, gave it an advantage over all surrounding religions, and led to its surprising extension, was the spirit of universal charity and sympathy that it breathed, as contrasted with the exclusiveness of caste. In this respect, it held much the same relation to Brahmanism that Christianity did to Judaism. It was, in fact, a reaction against the exclusiveness and formalism of Brahmanism—an attempt to render it more catholic, and to throw off its intolerable burden of ceremonies. Buddhism did not expressly abolish caste, but only declared that all followers of the Buddha who embraced the religious life were thereby released from its restrictions; in the bosom of a community who had all equally renounced the world, high and low, the twice-born Brahman and the outcast were brethren. This was the very way that Christianity dealt with the slavery of the ancient world. This opening of its ranks to all classes and to both sexes—for women were admitted to equal hopes and privileges with men, and one of Gautama's early female disciples is to be the supreme Buddha of a future cycle—no

doubt gave Buddhism one great advantage over Brahmanism. The Buddha, says Max Müller, 'addressed himself to castes and outcasts. He promised salvation to all; and he commanded his disciples to preach his doctrine in all places and to all men. A sense of duty, extending from the narrow limits of the house, the village, and the country, to the widest circle of mankind, a feeling of sympathy and brotherhood towards all men, the idea, in fact, of humanity, were first pronounced by Buddha.' This led to that remarkable missionary movement, already adverted to, which, beginning 300 B.C., sent forth a succession of devoted men, who spent their lives in spreading the faith of Buddha over all parts of Asia.

In the characteristic above mentioned, and in many other respects, the reader cannot fail to remark the striking resemblance that Buddhism presents to Christianity, and this in spite of the perverse theory on which it is founded. On the other hand, by giving prominence to the extravagances and almost inconceivable puerilities and absurdities with which the system has been overloaded, it would be easy to make it look sufficiently ridiculous. But this is not to depict, it is to caricature. The only fair—the only true account of any religion, is that which enables the reader to conceive how human beings may have come to believe it and live by it. It is this object that has been chiefly kept in view in this meagre sketch of a vast subject.

For the history of the Buddha and his religion, see Burnouf, *Introduction à l'Histoire du Bouddhisme Indien* (1876); Köppen, *Die Religion des Buddha* (1857); Oldenberg, *Buddha* (1881; Eng. trans. 1882); Saint-Hilaire, *Le Bouddha* (1862); Kern, *Geschiedenis van het Buddisme* (1884); the various works by Rhys Davids (1880–1908); by Lillie; the lives by Beal (1875) and Rockhill (1884); Arnold, *The Light of Asia* (1882); Titcomb, *Buddhism* (1885); Bastian, *Der Buddha in seiner Psychologie* (1882); Alvis, *Buddhist Nirvana* (1871); Sénart, *La Légende du Bouddha* (1875); Obry, *Du Nirvana Bouddhique* (1863); Max Müller, *Buddhist Nihilism* (1869); Eitel, *Buddhism* (1873); Kistner, *Buddha* (1869), with a complete bibliography; Sir Monier Williams, *Buddhism* (1883); L. A. Waddell, *The Buddhism of Tibet* (1895); H. Stcherbatsky, *The Central Conception of Buddhism, and the meaning of the word Charma* (1923); the works of Beal, Edkins, Eitel, Legge, and Schott for Chinese Buddhism; of Koppen and Schlagintweit for Tibetan; and of Alabaster for Siamese.

The following are some of the principal translations of, or compilations from original works in Pali, Sanskrit, Tibetan, and Chinese: Spence Hardy, *Manual of Buddhism* (1860), *Eastern Monachism* (1860), and *Legends and Theories of the Buddhists* (1866); Burnouf, *Le Lotus de la Bonne Loi* (1852); Schiefner, *Taranatha's Geschichte des Buddhismus* (1869) and *Lebensbeschreibung Sakjamunis* (1849); Rhys-Davids, *Buddhist Birth Stories*, vol. i (1880); Rogers, *Buddhaghosha's Parables* (1870); Foucaux, *Histoire du Bouddha* (1868); *Fa Huan's Travels*, translations by Rémusat, Beal, Giles, and Legge; *Hsuen-Thsang's Travels* by Stan. Julien and Beal; *Lahita Vistara* by Raj. Mitra and Lefmann; *Dhammapada* by Fausbøll, Müller, Beal, Rockhill, Weber, and Schulze; parts of the canon in *Sacred Books of the East*, vols. x. xi. xiii. xvii. xix. and xx.; other parts by C. Swamy, Childers, and Beal; *I Discorsi di Gotama Buddha*, translated into Italian from the Pali by Neumann and Lorenzo (Bari, 1907).

Buddhism, ESOTERIC. See THEOSOPHY.

Budding, a process in the propagation of ligneous plants analogous to Grafting (q.v.). It consists in the transferring of a bud from one shoot to another on the same or a different plant. Although chiefly employed in gardens as a rapid, economical method of increasing new and choice or rare kinds of fruit-trees and flowering trees and shrubs, it may also be used to improve the fruitfulness of barren fruit-trees, it being quite practicable to insert

blossom-buds into the branches of trees that are deficient in them. *Shield-budding*, which is the most commonly practised of several modes, is preferred for fruit-trees with gummy sap, such as the plum, cherry, peach, and apricot, as it lessens the tendency in such trees to canker at the wounded parts. It may be performed at any time when the bark rises freely from the young wood. This it usually does from June to September, but the fitness of the bud for the operation is to be judged of solely by the freedom with which the bark separates from the wood. The bud must be well formed, but not necessarily mature. The subjoined cut

represents the various parts in the mode known as *shield-budding*: *a* is the bud cut out, with a shield of bark attached to it; *b*, the stock, with a slit in the bark to receive the shield and bud; *c*, the bud inserted and the leaf cut away. The bud is cut by means of a sharp knife from the branch on which it has grown—usually a branch of the current year's growth—a small portion of the bark and wood being taken together, extending to about half an inch above and three-quarters of an inch below the bud. The woody part is then removed from the bark, taking care to prevent the base or root of the bud from being injured. If injured, the base will present the appearance of a circular cavity, which is caused by the removal of the centre or growing point of the bud, in which case it is worthless, and should be thrown away. A longitudinal and a transverse cut in the form of the letter T, as shown at *b*, are then made in the bark of the stock to receive the bud; the thin ivory point of the handle of the budding-knife is used to raise the bark, and the bud is inserted. The bark extending above the bud is then cut over so as to fit exactly the transverse cut in the stock. A strand of soft matting or soft cotton-yarn is then wound firmly but not tightly around the stock to bind the bark down on that of the bud, in order to keep the latter in its place and prevent the access of dry air or heavy rains to the wounds. Of other methods of budding, the *reversed shield* is that commonly used by nurserymen and gardeners about Genoa in the rearing of orange-trees. The only difference between this and the mode first described is that the transverse cut in the stock is made at the bottom instead of the top of the longitudinal one. *Scallop-budding* is another mode in which the wood adhering to the bark of the bud is not removed, but instead is carefully fitted to a corresponding section in the stock, made by the removal of a portion of the bark and wood. The fitting of the edges of the bark of the bud to that of the stock is essential to success in practising this method, but it is altogether less sure than ordinary *shield-budding*. It may, however, be performed in spring, and if it fails, the object in view may be attained by the other method during summer and autumn.

Buddleia, a genus of shrubs of the order Loganiaceae, of which eighty species are known, all natives of the warmer parts of the world, and some of them much admired for their beautiful flowers. *B. globosa* (Chile), with globose heads of orange-coloured flowers, is hardy enough to endure the climate of most parts of England, and

several half-hardy species have also been introduced.

Budé, GUILLAUME. See BUDÆUS.

Budé, a watering-place on the north coast of Cornwall, 17 miles NNW. of Launceston. Pop., with Stratton, 4000. Bude Castle was the home of Sir G. Guiney, who in 1839-41 patented the *Bude burner*, consisting of two, three, or more Argand (q.v.) burners, each inner one a little above the outer.

Budejovice. See BUDWEIS.

Budge, SIR ERNEST A. WALLIS, keeper of Assyrian and Egyptian antiquities in the British Museum (1893-1924), born in 1857, studied at Cambridge, excavated at Aswan, Meroe, Nineveh, &c., and wrote and edited much on relevant subjects.

Budgell, EUSTACE (1686-1736), was born at Exeter, a cousin of Addison's, and from Trinity College, Oxford, proceeded to the Inner Temple. He lost £20,000 by the South Sea Bubble, from a contributor to the *Spectator* degenerated to a Grub Street hack, and at last drowned himself in the Thames.

Budgerigar is a kind of Parrakeet (q.v.).

Budget, from the same source as the French *boisgîte*, means a small bag, and has been used metaphorically to express a compact collection of things, as a budget of news, a budget of inventions, and the like. Water-budgets or buckets were a very honourable blazon on a coat-armorial, as being generally conferred in honour of some valiant feat for supplying an army with water.

The term 'The Budget' is in Britain, from long usage, applied to that miscellaneous collection of matters which aggregate into the annual financial statement made to parliament by the Chancellor of the Exchequer. It contains two leading elements—a statement how the nation's account of charge and discharge stands in relation to the past, and an explanation of the probable expenditure of the ensuing year, with a scheme of the method in which it is to be met, whether by the existing or new taxes, or by loan. The statement of the budget is always an important, sometimes a very exciting, occasion; as, for instance, Sir Robert Peel's adoption of an income-tax in 1842, and his legislation for free-trade in 1846. Mr Gladstone's eight budgets (1859-66), when Chancellor of the Exchequer in Lord John Russell's government, have always been considered as models of financial exposition. Sir Wm. Harcourt's of 1894, and Mr Lloyd George's of 1909, were memorable. See REVENUE. For a critical examination, see Bernard Mallet, *British Budgets, 1887-8: 1912-13*; and for the war period, Professor J. S. Nicholson, *War Finance* (1918).

Budh Gaya. See BUDDH GAYA.

Budrun, or BUDRUM, a seaport town of Asia Minor, on the north shore of the Gulf of Kos, about 96 miles S. of Smyrna. It is the site of the ancient *Halicarnassus* (q.v.), the birthplace of Herodotus and Dionysius. Pop. about 6000.

Budweis (Czech *Budejovice*), a town of Bohemia, on the navigable Moldau, 133 miles NW. of Vienna by rail. It has a cathedral, with a detached belfry dating from about 1550; manufactures of stoneware, machines, lead-pencils, saltpetre, &c.; besides a brisk trade in grain, wood, coal, and salt. Pop. 44,000. In the neighbourhood is Schloss Frauenberg (1840-47), the seat of the Schwarzenberg family.

Buca, formerly capital of Cameroon, now in the British mandatory territory, stands on the seaward slope of the Cameroon mountain.

Buelow. See BÜLOW.

Buen-Airé (Span.), Fr. BONAIRE, a West Indian island, 60 miles from the coast of Vene-

zuela, and 30 E. of Curaçao, like which it belongs to the Dutch. It produces timber, cattle, cochineal, and salt. Area, 100 sq. m.; pop. 7000.

Buenaventura, a town on the Pacific coast of the republic of Colombia. It has a hot, sickly climate, but is the port for the healthy and rich Cauca valley. Pop. 5000

Buena Vista, a village of Mexico, 7 miles S. of Saltillo, where, on February 22-23, 1847, some 5000 United States troops under Taylor defeated 20,000 Mexicans under Santa Anna.

Buenos Aires (often spelled *Buenos Ayres*), the largest and most important province of the Argentine Republic in South America, extending along the Atlantic, from the mouth of the Plata to that of the Río Negro on the 41st parallel. On the NE. it is washed by the river Plata (Plata) and the Paraná, the latter separating it from the province of Entre Ríos. Its area is estimated at 118,000 sq. m., almost equal to that of the British Islands; its population, 648,140 in 1885, was at the census of 1914 over 2,000,000, and was estimated in 1919 at 2,279,500. With a much larger area it was originally an appendage of Peru, and became in 1775 a separate viceroyalty of itself. 'The United Provinces of the Plata' continued down to 1853 to recognise the city of Buenos Aires as their head; and after the constitution of the Republic, the inland states endeavoured both by war and diplomacy to reannex the maritime province. Their object was attained in 1860, and the city remained capital of the province and temporary capital of the confederation until it was federalised in 1880, the seat of the provincial government being removed to La Plata, 30 miles to the south-east, in 1884.

The country is so flat that most of the rain which falls is either absorbed or evaporated, or lost in salt-lakes, comparatively little drainage entering the Paraná or the Plata; the largest rivers, the Salado (360 miles), and the Colorado (700) in the south, empty into the Atlantic. The climate, though on the whole healthy and agreeable, is yet by no means steady or uniform. Every wind, in general, has, to a remarkable degree, its own weather—sultriness coming from the north, freshness from the south, moisture from the east, and the dry and piercing *pampero* winds from the west; and besides the periodical heats of every summer, successive years of more than ordinary drought occur. The rainfall ranges from 19 inches at Bahía Blanca to 38 at Matanzas; snow falls only in the far south, though thin ice is occasionally seen, the temperature ranging from 24° to 108° F. Agriculture is carried on all over the province, and is the chief source of wealth. Practically all the land is divided up by wire fences. It has greatly increased in value. The province contains well-nigh half of the sheep of the republic. Its interior presents almost uninterrupted pasturage to countless herds of horses and cattle, and the business of grazing occupies or interests the great bulk of the population; but the droughts that affect the high northern camps, as well as the frequent inundations to which the low-lying southern camps are exposed, are often more destructive to the herds than the not infrequent plague of locusts is to the crops. The coast-line (740 miles, with about 150 miles on the Paraná) is low and sandy, and the ports of the province are very few. Bahía Blanca, in the extreme south, has an excellent port which is largely frequented, and exports vast quantities of cereals. There is a good harbour at La Plata, and one at San Nicolás on the Paraná, next to those mentioned the most considerable town in the province. Immigration from Europe has been encouraged by legislative enactment; and a comparatively

genial climate is a recommendation to foreigners. The cultivation of wheat and corn has received increased attention, both being raised in large quantities. The shipping and commerce are extensive, being a large proportion of that of the whole republic. The chief exports are wheat, maize, linseed, wool, beef, mutton, hides and other animal products, tanning materials, alfalfa, and hay; the principal imports are food, textiles, oils, iron and its manufactures, pottery, &c. There is steady immigration into the province, in some years exceeding 230,000 (chiefly Italians and Spaniards). Many railways traverse Buenos Aires.

Buenos Aires, the federal capital of the Argentine Republic, on the right bank of the Plata, which here, at a distance of 150 miles from the open sea, is 30 miles across. The city, which forms a federal district (72 sq. miles), was practically rebuilt during the last twenty years of the 19th century and the early years of the 20th; and the harbour, formerly inaccessible to all but small vessels, has been very greatly improved. Formerly ships drawing more than 15 feet had to anchor 7 or 8 miles from the shore. Improvements were begun in 1887, and resumed in 1910. The port has now two harbour entrances with 24 to 30 feet of water (one 15 miles long and 323 feet wide), and a number of basins, sluice docks, and dry docks, accommodating the largest steamers. Wharves have been constructed on the banks of the Riachuelo, where the great southern railway docks are situated. The port is equipped with very powerful electric and hydraulic cranes, and the newest loading appliances, warehouses, and oil-fuel depots. The water-supply of the city, pure and ample, though delivered under too low a pressure, is drawn from the river Plata, and filtered after treatment with iron alum, and pumped to three great distributing tanks.

Fuel is scarce and dear; and building-stone and timber come mainly by sea, the territory near the city being purely alluvial. A little granite comes from the Tandil, 180 miles to the south. Brick-clay, however, abounds on the spot. The city is regularly laid out in streets intersecting at right angles, through which diagonal avenues are being cut. It is now the largest city in the southern hemisphere, vastly exceeding either Sydney or Melbourne. In 1869 its population was about 178,000, in 1890 about 500,000, in 1910 over 1,302,000, at the census of 1914 1,575,814; in 1920 it was estimated at 1,674,000. About half of the inhabitants are foreign, chiefly Italians and Spaniards. The shore is lined with grain-elevators and great slaughter-houses, and the mean quarters inhabited by Italian labourers. The streets in the centre are narrow, but well paved with asphalt or wood blocks. A great boulevard, the Avenida de Mayo, runs for a mile and a half through the heart of the city. The Calle de Florida is another great thoroughfare. The suburbs are beautiful. There are many plazas and parks, of which the great Palermo Park is very fine. These open spaces are a valuable feature, since blocks of houses from 6 to 13 stories, built of a steel framework faced with stone or stucco, are everywhere springing up in the city. The old Spanish colonial architecture, however, survives alongside the over-sumptuous buildings of the vulgar rich. The poorer classes live in great squalor in districts covered with mud-huts and shanties and unpaved streets.

The principal buildings are the cathedral, second in South America to that of Lima alone; the chapel of Santa Felicitas; Anglican, Lutheran, Methodist, and Presbyterian churches; the university, the congress-hall, a military college, the post-office, an imposing opera-house, the archbishop's palace, the mint and government offices, the exchange, and some of the banks and palatial

railway depots. Many thousands of cattle, sheep, and swine are slaughtered. There are many printing establishments, cigar, carpet, cloth, furniture, and boot and shoe factories. The city is the seat of an archbishopric, and possesses public libraries and museums, hospitals, and numerous other charitable institutions. The terminus of nine railways, it has 500 miles of tramway line, on which 250 million passengers are annually carried, and the first underground railway in South America. About 300 newspapers and periodicals are published in Buenos Aires, including some in Italian, German, English, Scandinavian languages, French, Basque, and Russian. The exports and imports of the port comprise the great bulk of Argentine foreign trade. Buenos Aires was founded in 1535, but was subsequently twice destroyed by the Indians. The French revolutionary wars, in which Spain sided with France, led to British interference with this Spanish colony, considerably to the disadvantage of Britain. In 1806 a British force under General Beresford and Sir Home Popham, which had just captured the city, was obliged to surrender; and in 1807 another, under General Whitelocke, which attempted to recover the place, was repulsed with heavy loss; and these successes over so formidable a foe emboldened the colonists, three years afterwards, to throw off the yoke of Spain. To celebrate the centenary of national independence, a great exhibition was held in 1910.

Buer, a coal-mining town of Prussia, in Westphalia, 10 miles NNE. of Essen; pop. 90,000.

Bufarik. See BOUFARIK.

Buffalo, a city of New York state and capital of Erie county, is at the eastern end of Lake Erie and at the head of the Niagara River, and is named from Buffalo Creek, which here runs into the lake. The city stands 295 miles NW. of New York city in a direct line, but by the Erie Railroad 423 miles; the distance from Chicago is 539 miles. The Erie Canal as reconstructed since 1918 connects it with Troy (350 miles), and so by the Hudson River with New York. In population and wealth Buffalo ranks second among the cities of New York. It has a capacious harbour, which has been dredged so that vessels of 17 feet draught can enter. There is an outer breakwater 4000 feet long, besides other breakwaters, piers, basins, and canals, constructed by the Federal, State, and municipal governments, at an expense of many millions of dollars. The harbour is guarded by Fort Porter, which stands 2 miles out from the heart of the city; close by is the old fort, built in 1812, and now in ruins. Two miles below, at Black Rock, long since included in the city, is the International Iron Bridge by which the Grand Trunk Railroad crosses the Niagara River. The water front of the city extends 5 miles along the lake and river, while Buffalo Creek has been rendered navigable for over a mile. The commercial importance of Buffalo dates from the completion of the Erie Canal in 1825; but since 1862 the lake commerce has yielded to the competition of the railroads. The Board of Trade was incorporated in 1857. The chief business is the receiving, transferring, and storing of grain, which employs numerous elevators, some of them stone structures, others iron and brick. There are also large floaters and transports. The live-stock trade rivals the grain trade in importance; the iron and steel works rank next to those of Pittsburgh; and the shipments of Pennsylvania coal, which finds a depot here, have greatly increased in recent years. The lumber trade is also very large and important. The industrial works comprise iron and steel works of various

kinds car-shops, iron ship yards, flour-mills, soap-works, factories for meat products, wooden goods, linseed oil, motor-cars, clothing, agricultural implements, besides many small establishments of all kinds. The navigation of Lake Erie usually opens about the middle of April, the extreme dates being a month earlier and a month later. Main lines of railroad connect Buffalo with New York, Philadelphia, Chicago, and Canada. In November 1896 electric power generated at Niagara Falls was rendered available for factories and tramways in Buffalo. The city has wide streets, well paved and lighted, and generally lined with trees. It has excellent sewerage, and extensive water-works supplied from Niagara River; and its healthfulness is attested by the low death-rate of 14 per 1000. There are five public squares, and the magnificent park consists of three sections, connected by boulevards which encircle the city. Delaware Avenue, the leading street for private residences, is about 3 miles long, and is lined with double rows of trees. Main Street, the principal trading thoroughfare, has many substantial business blocks. The city and county hall is an imposing structure of Maine granite, in the form of a double Roman cross, with a tower 245 feet high, surmounted by four statues. The other prominent buildings are the United States custom-house and post-office, the state arsenal, the county penitentiary, and a state asylum for the insane (in North Buffalo), which has accommodation for 600 patients. At the Pan-American Exposition held here in 1901 President McKinley was assassinated. Of the two finest of its many churches, St. Joseph's Cathedral (Roman Catholic) is a gray Gothic structure; and St Paul's (Episcopal), in brown stone, was partly burned in 1883. The public schools have an average daily attendance of 50,000. The university of Buffalo, organized in 1846, includes a College of Arts and Sciences, and departments of medicine, dentistry, pharmacy, and law. The Catholics, the strongest body in the city, have Canisius College and other schools. There are also a law college and several business colleges. A number of daily newspapers are published, many of them in German. The Grosvenor Free (reference) Library has 130,000 volumes, and there is a public library with over 380,000 volumes, its building giving accommodation also to the rooms and collections of the Buffalo Society of Natural Sciences. Another of Buffalo's learned bodies is the Buffalo Historical Society. The Fine Arts Academy occupies a fine white marble building, in which permanent and special collections are exhibited. There are also a Mechanics' Institute, a Young Men's Christian Union and Catholic Institute. Among the charitable institutions are hospitals, a dispensary, and orphan asylums.

Buffalo was founded in 1801 by the Holland Land Company. It was burned in 1813 by British and Indians. It was incorporated as a city in 1832, and had then a population of 15,000, which had increased in 1850 to 42,300, in 1860 to 81,130, in 1870 to 117,714, in 1880 to 155,137, in 1900 to 352,387, in 1910 to 423,715, and in 1920 to 506,775.

Buffalo, a name often applied to two distinct bovine genera or sub-genera—viz. the Asiatic Buffalo (*Bubalus*) with the Cape Buffalo; and the American Buffalo, better called Bison, and discussed under that head. The genus or sub-genus *Bubalus* has the usual bovine characteristics, and whatever be its exact limits in strict zoological classification, remains for practical purposes a large, clumsy ox. The horns rise from the posterior side corners of the skull, are usually thickened out of proportion at the base, and irregularly ridged, though smooth towards the points; the forehead is short and arched; the covering of hair is comparatively sparse. The

common or Asiatic Buffalo (*B. buffelus*) has beautifully twisted horns, thick and broad at the base, rough on to the middle, somewhat triangular in section. The horns lie back on the shoulders when the animal walks or runs, with its muzzle projecting characteristically forwards. The hair is short and scanty, almost bristly, slightly longer on head, shoulders, and front of neck, and all but black in colour. The bare brown polished hide is, however, the more striking feature. The animal measures about 7 feet in length, and stands about 4 feet high at the shoulder. It is a native of the East Indies, has been domesticated in India, and thence introduced into Egypt, Greece, Italy, Hungary, &c. It is said to have reached Italy towards the end of the 6th century A.D., and there it has been its fate, as elsewhere, to become a beast of burden. The animal is adapted for marshy situations, which it naturally affects; preferring for its food the rank coarse herbage which they afford, delighting to immerse itself in water till only its head appears above the surface, in which condition it will remain for hours. It often envelops itself in mud as a protection against insects. On account of these propensities, the buffaloes used as beasts of burden in India are seldom laden with any goods liable to be spoiled by water, as the animal is always ready to take an opportunity of lying down with his load in any river or pond which presents itself. In Italy the buffalo seems nowhere more at home than in the Pontine Marshes and the pestilential Maremma.

Head of the Asiatic Buffalo
(*Bubalus buffelus*).

The buffalo is a very powerful animal, much more powerful than the ox, and capable of dragging or carrying a far heavier load. The female yields a much greater quantity of milk than a cow, and of excellent quality. It is from buffalo milk that the *ghee* or semi-fluid butter of India is made. The hide is greatly valued for its strength and durability, but the flesh is decidedly inferior to that of the ox.

The buffalo exhibits a considerable amount of intelligence. In a state of domestication, it is capable of becoming very docile. In a wild state the buffalo is savage and dangerous, and even in domestication it is apt to resent injury. Alone, perhaps, of wild animals in India, it will attack unprovoked. The native princes of India make buffaloes and tigers fight in their public shows; and the buffalo is more than a match for the tiger, even in single combat. The buffalo is used in some parts of the East in the shooting of waterfowl; the sportsman conceals himself behind the animal, which, being a familiar sight, does not alarm the birds.—The Arnee is a very large variety of the common buffalo; a head has been known to measure 13 feet 6 inches along the horns. It occurs in the Indian islands and in Farther India in a wild state, but is also domesticated and used as a beast of burden.

The Cape Buffalo (*Bos caffer*) is generally regarded as a distinct species. The horns are very large; they spread horizontally over the top of the head, and are then bent down laterally, and turned upwards at the point. The head is carried, as by the common buffalo, with projecting muzzle and reclining horns, but the bases of the horns nearly meet on the forehead, where they are from 8 to 10

inches broad. The length of a full-grown Cape buffalo is about 8 feet from the root of the horns to the tail, and the height is $5\frac{1}{2}$ ft. This animal

The Cape Buffalo (*Bos capensis*).

is regarded as more formidable than any other in South Africa. The buffalo is still found in large herds in the marshy wooded regions of Mid and South Africa, but in the Cape Province, where it was once plentiful, it has now become comparatively rare. It grazes chiefly in the evening, and lies in woods and thickets during the day. It will readily act on the aggressive, and has never been domesticated. The flesh, though coarse, is palatable.—*B. brachyceros* is another African species.—The Dwarf Wild Cow of the island of Celebes (*Anoa* or *Probalus celebensis*) is also related to the buffaloes.—See BANTENG, BISON, BOVIDÆ, GAUR, YAK.

Buffalo Berry (*Shepherdia argentea*), an ornamental shrub of the family Eleagnaceæ, with a red or yellow edible fruit resembling the currant, cultivated in NW. North America. It is dioecious, with spines and silvery leaves.

Buffalo Bird. See BEEF-EATER.

Buffalo-nut, or OIL-NUT, the edible fruit of the buffalo-tree, a North American santalaceous shrub (*Pyrularia pubera* or *P. oleyfera*), is about the size of a large cherry. The seed yields oil.

Buffalo River, the name of two South African rivers, one of which flows through the south east of the Cape Province to the Indian Ocean at East London, whose harbour it forms; the other, also called the Umzinyati, in Natal, joins the Tugela 50 miles from its mouth.

Buffer, a mechanical apparatus, consisting usually of a plate or cushion supported by a strong spring, and fixed at the ends of railway carriages and engines, and at termini, to deaden the effect of concussions in starting, slowing, and stopping trains. The name is applied also to simpler devices which sustain the concussion without deadening it. In politics the figurative term buffer-state is applied to a country which is in like manner interposed between the territories of powers that would otherwise be liable to come into collision. The name was early applied to Afghanistan, the buffer-state between India and Russia, and has been extended to Siam, between French and British possessions, and similar states elsewhere.

Buffon, GEORGES LOUIS LECLERC, COMTE DE, was born at Montbard, in Burgundy, on September 7, 1707. His father was a rich man, belonging to the noblesse de robe. After studying law at the Jesuit college in Dijon, he devoted himself wholly to science. At Dijon he became acquainted with

an English nobleman, Lord Kingston, with whom he went on a tour through France and Italy, and in whose company he visited England. While in England he translated into French Newton's *Fluxions*, Hales's *Vegetable Statics*, and a work on agriculture by Tull. On returning to France he soon gained distinction as a writer on scientific subjects, and was in 1739 appointed director of the Jardin du Roi, a post which gave him command of the royal museums and collections of living animals and plants. He then formed the design of his *Histoire Naturelle*, in which all the known facts of natural science were to be embodied and discussed in what he believed to be language of the loftiest eloquence. In producing the fifteen volumes of the *Histoire*, which appeared between 1749 and 1767, he was assisted by Daubenton, the Abbe Bexon, Guesneau de Montbéliard, and others, whom he entrusted with the compilation of facts and the composition of the less ambitious passages. The work brought him an immense reputation, and was translated into most of the languages of Europe. Its rhetorical flights were regarded with extravagant admiration; Rousseau, who visited Buffon at the château of Montbard, is said to have fallen on his knees and kissed the doorstep of the pavilion in which parts of the book were composed. Montesquieu, D'Alembert, and Voltaire, however, formed a different estimate of its author's ability. Though he may be ranked among the *philosophes*, Buffon was not one of the leaders or militant members of the party. He was in 1753 admitted to the Academy. After receiving various high honours, he was made Comte de Buffon by Louis XV. He died at Paris on April 16, 1788. Buffon, it has been said, completely exemplified his own phrase: *Le style est l'homme même*. He was as pompous in his manners as in his writings. He regarded himself as a supreme authority on all that related to literary form; his remark, however, that certain verses which he happened to admire were as beautiful as beautiful prose, illustrates his thorough misunderstanding of the principles of sound criticism. After being greatly overrated, his work is now, perhaps—at least out of France—somewhat unfairly disparaged. He was rash and over-confident in his speculations; his book has no longer any scientific value; much that he wrote and that once passed for soaring eloquence is now recognised as fustian. But he was inspired by a genuine love of knowledge. He sought to invest natural science with new dignity and interest in the eyes of the world at large, and he undoubtedly achieved his object. He may claim a place in the history of the doctrine of evolution, from having opposed the old system of zoological classification, on the ground that an unbroken succession of forms could be traced through the animal kingdom.

See Richard's edition of his *Œuvres complètes* (1825-28), his *Correspondance* (2 vols. 1860); Flourens, *Buffon* (1844); Nadauld de Buffon, *Buffon, sa Famille et ses Familiers* (1863); the Life by Lebasteur (1889); Packard, *Lamarck* (1902); Mme. Duclaux, *The French Ideal* (1911).

Buffoon is a jester, from the Ital. *buffa*, 'a trick.' From the same word come *buffo*, 'a comic actor or singer,' and the French name, *opéra-bouffe*, for comic opera. See FOOLS.

Bug, the name of two European rivers. The Western Bug rises in Eastern Galicia, and after a course of about 470 miles joins the Vistula near Warsaw. The Eastern Bug, the Hypanis of the ancients, rises in Podolia, and flows 520 miles south-east into the estuary of the Dnieper.

Bug, a popular name for insects in the order Hemiptera, and in the subdivision with unequal wings—Heteroptera. It may be widely applied to

the whole of this subdivision, including land-bugs and water-bugs, the former to the number of almost 8000 species, the latter much less numerous. The Boat-fly (q.v.) or water-boatman has been already described, and may, along with the water scorpions (*Nepidae*), serve to illustrate the water-bugs. The *Geocoris* or land bugs may considerably, but have large long feelers with four or five joints, are especially at home in warm countries, are often brightly coloured, have an unpleasant smell, and usually eat other insects or sometimes also the juices of plants. The bug *par*

Cimex lectularia.

excellence, however, is the *Cimex* or *Acanthia lectularia*, the well-known bed-bug. It was known to the Greeks as *Koris*, to the Romans as *Cimex*, and was believed by Aristotle to arise spontaneously from sweat. It is a wingless insect, thus differing from most of its fellow bugs. The body is very flat, the long slender feelers and the legs with fine hairs, the posterior part of the body almost circular. The length is about $\frac{1}{8}$ of an inch. The colour is rusty red, with traces of yellow. The mouth is suctorial. During the day the insect lurks quietly in crevices of walls and bedsteads, but is active and hungry at night, sucking the blood of higher animals, and notoriously of man. Since such opportunities but rarely occur, the animal prepares for long fasting by distending itself with blood when a meal is offered. As pests, they are too well known, especially where the furniture is not kept clean, and exasperated sleepers are no longer able to console themselves with the old belief that the bite was an antidote to the venom of snakes. The female bug is said to lay eggs four times between March and September, and each time about fifty. The larvæ are in most respects like the adult, the metamorphosis being incomplete. The first three broods, each reaching sexual maturity in about eleven weeks, develop, the last brood appears to perish, while the adult insects persist through the winter, enduring a considerable degree of cold. The bed-bug is said to have come from the East, and it certainly follows human migration. It was not known in Strasburg, according to Leunis (*Synopsis des Thierreichs*), till the 11th century, and the refugee Huguenots have been blamed for bringing it to London. Strict cleanliness is the best preventive; turpentine and even corrosive sublimate are among the recommended insecticides. The same species is known to attack pigeons, and other species trouble bats and swallows. For an account of the bug family as a whole, systematic works on insects must be consulted. Many of the thousand forms have some scientific interest and practical importance. A large number may be studied on our common plants and trees. Some of the winged wood-bugs or field-bugs are capable of inflicting very painful wounds. Forms an inch in length are known to occur. Flying-bugs, 'enormous and fetid,' are among the pests of India. Night is the time of their activity. Warm countries generally have winged bugs of great size and beauty; but if touched or irritated, they 'exhale an odour that, once perceived, is never after forgotten.' A winged bug, as large as a cockchafer, lodges in the thatch and roofing of houses in Chile, and sallies forth at night, like the bed-bug, to suck blood, of which it takes as much as a common leech.—It is worthy of notice that a species of field-bug (*Acanthosoma*

griseum), a native of Britain, is one of the few insects that have yet been observed to show affection and attention to their young. De Geer observed the female of this species, which inhabits the birch tree, conducting a family of thirty or forty young ones as a hen does her chickens, showing great uneasiness when they seemed to be threatened with danger, and waiting by them instead of trying to make her own escape.

Bugbane, or BUGWORT (*Cimicifuga*), a fetid genus of Ranunculaceæ, allied to Baneberry (*Actæa*), of which both the European and American species are said to drive away insects.

Bugeaud, THOMAS, French marshal, was born at Limoges in 1784, and entering the army in his nineteenth year, showed such bravery during the Napoleonic campaigns as by 1814 earned him a colonelcy. Recalled from a fifteen years' retirement to active life by the July revolution of 1830, he was elected deputy for Périgueux, and soon gained Louis-Philippe's esteem; in 1836 was despatched to Algeria, where he distinguished himself against Abd-el-Kader; and in 1840 was appointed governor-general. The Zouaves owed their organisation to him. His victory at Isly in 1844 over the emperor of Morocco's forces gained him the title Duc d'Isly, and the year before he had received the marshal's bâton. In the revolution of February 1848 he commanded the army in Paris. He died of cholera in Paris, June 9, 1849. See his Memoirs by Count d'Ideville (Eng. trans. 2 vols. 1882); and Roches, *Le Maréchal Bugeaud en Afrique* (1885).

Bugenhagen, JOHANN, surnamed *Doctor Pomeranus* or *Pommer*, one of Luther's chief helpers in the Reformation, was born in 1485 near Stettin, in Pomerania, studied at Greifswald, and as early as 1503 became rector of the Tieptow academy. In 1520 his religious views were changed by reading Luther's little book, *De Captivitate Babylonica*. He now betook himself to Wittenberg, where he busied himself in preaching and teaching in the university. His great talent for organisation found work to do in establishing churches in Brunswick, Hamburg, Lubeck, and Pomerania, and in reforming the ecclesiastical establishments of Denmark, whither he was called by Christian III. in 1537. He died 20th April 1558. Bugenhagen aided Luther in his translation of the Bible. Of his own works the best is his *Interpretatio in Librum Psalmorum* (1523). His Life has been written by Bellemaun (1859), Vogt (1868), Zitzlaff (1885), Hering (1888), and Graep (1897).

Bugge, ELSEUS SOPHUS, a Norwegian philologist, born 5th January 1833 at Larvik, studied at Christiania, Copenhagen, and Berlin, and in 1866 was appointed professor of Comparative Philology and Old Norse at the university of Christiania. His *Old Norse ballads* (1858) and historical legends (1864-65), critical edition of the earlier *Edda* (1867), studies in ancient Italian dialects (1878) and on the origin of the Scandinavian legends of gods and heroes (1881-82), besides numerous dissertations on all departments of the Teutonic and Romance languages, put him in the first rank of philologists. He died in July 1907.

Buggy (an Indian word) is a gig with a hood in India; in England it is a light two-wheeled vehicle without a hood; but in the United States is a light one-horse four-wheeled vehicle with a hood.

Bugis. See BONT.

Bugle (*Ajuga*), a palæarctic genus of Labiatae. The Common Bugle (*A. reptans*) is abundant in moist pastures and woods of Europe. Its flowers are generally blue, but white and purplish varieties are sometimes grown in flower-borders. *A. alpina* is one of the beautiful flowers of the Swiss Alps.

Bugle (Fr. *bugle*; Ger. *flügelhorn*; Ital. *tromba*), a treble musical instrument with a cup mouthpiece, usually made of copper, with strengthening pieces of brass soldered on where most exposed to wear. The bell is less expanded than the Trumpet (q.v.), and the tube is shorter and more conical. (Compare the figure with those in the articles CORNET and TRUMPET.) This form gives it that peculiar,

Bugle.

penetrating, and far-reaching sound which renders it so admirably suited for its sole purpose—viz. a military signalling instrument. The bugle was formerly used only in the infantry branch of the service; but it has now superseded the trumpet for field duty in the cavalry and artillery branches.

It is made in the key of B♭, and its notes are the

open notes of the tube—C (below the staff), G, C, E, G. It has also C, octave lower, and B♭ and C above; but the first five are the only effective notes. It is provided with two rings, to which a cord is attached for suspension to the shoulder of the bugler. See BAND (MILITARY).

The *Kent bugle*, a bugle with keys to provide the additional notes (see MUSIC—*Musical Instruments*), was at one time very popular as a leading instrument in brass bands. It was, however, difficult to play, and another modification, the *valved bugle*, was introduced. Both are now entirely superseded by the Cornet (q.v.) as a leading instrument, except in the purely bugle-bands of some of the rifle regiments. A valved attachment to fit on to the ordinary bugle, to enable it to be used as a band instrument, has also been invented, but little use has been made of it.

Bugle sounds or calls, as the military signals are called, are all written within the compass of the five principal notes of the bugle. They vary in character from a single note G, meaning 'right' (two Gs being 'centre,' and three 'left'), to the infantry 'reveille,' or morning call, which may be said to have some pretensions to being a musical composition, as it has five movements, a largo, allegretto, vivace, adagio, and presto. The soldiers display much ingenuity and considerable humour in adapting words to many of the calls. We append a few of the 'sounds' as specimens:

Bugle is a name for a slender, elongated kind of Bead (q.v.), usually black.

Bugloss, a name popularly applied to many plants of the natural order Boraginæ (q.v.), more strictly to *Anchusa* (*Lycopsis*) *arvensis*, a common weed in cornfields in Britain. See ALKANNET. The beautiful *Echium vulgare*, of the same order, bears the English name of Viper's Bugloss. Both these plants are naturalised in the United States.

Bugulma, a town in the Russian government of Samara, on the Bugulminka, a tributary of the Kama; pop. 13,000.

Bugurslan, a town in the Russian government of Samara, on the Kinel, in the great Volga steppe, with 20,000 inhabitants.

Buhl or Boule Work, the name applied to a sort of inlaying of brass scrolls and other ornamental patterns in wood. The name is derived from its inventor, Charles André Boule, less correctly Boule (1642-1732), a cabinetmaker in the service of Louis XIV. He employed veneers of dark-coloured tortoise-shell, inlaid with brass. Cabinets of his manufacture are highly prized, as are also those of his contemporary Reisner, a German, who used a ground of tulip-wood, inlaid with flowers, &c. in darker woods, and varied with margins and bands of light wood, with the grain crossed for contrast. This modification of buhl-work is correctly called

Reisner work. For a detailed account of the methods of working, see INLAYING, and MOSAIC.

Buhrstone, a variety of Quartz (q.v.), containing many small empty cells, which give it a peculiar roughness of surface, particularly adapting it for millstones. The name is given without reference to geological relations, but it is *vein quartz*, rather than true *quartz rock*, which ordinarily assumes the character of buhrstone. There are different varieties of buhrstone, some of which are more compact, or have smaller cells than others; and those in which the cells are small and very regularly distributed, about equal in diameter to the spaces between them, the stone being also as hard as rock-crystal, are most esteemed. Good buhrstone is found at Conway in Wales, and at several places in Scotland, as well as near Cologne in Germany. Buhrstones are quarried in New York, Pennsylvania, and North Carolina. But the finest millstones are obtained from the quarries of La Ferté-sous-Jouarre, in the department of Seine-et-Marne, near Paris. It is not unusual to form millstones of pieces of buhrstone cut into parallelepipeds, or other suitable shapes, and bound together by iron hoops. The stone is found in beds or in detached masses, and the mode of quarrying is peculiar. When the mass is large, it is cut out

into the form of a huge cylinder; around this grooves are cut, at distances of about 18 inches, the intended thickness of the millstones; into these grooves wooden wedges are driven, and water is thrown upon the wedges, which, causing the wood to swell, splits the cylinder into the slices required. —Millstones are sometimes made of siliceous grit-stones, of sandstone, and even of granite (see MILL). Buhrstone millstones are extremely durable.

Building. The walls of a house may be of concrete, wood, stone, brick, brick and timber, iron, mud, turf, and even snow. In the arctic regions a house with snow walls is felt to be fairly comfortable. In the tropics a strong tent constructed of posts and palm-leaves suffices for an abode. The following tradesmen take part in the erection of an ordinary dwelling-house: mason or bricklayer, marble-cutter, carpenter, joiner, slater, plasterer, glazier, smith or founder, plumber, gas-fitter, painter, and bell-hanger.

Site and Foundation.—If there is a choice of site, one should be chosen with a dry subsoil and good natural drainage. Where ground has been made up artificially, it should either be carefully avoided, or the tracks for the foundation courses of the walls must be sunk till they reach the natural stratum of earth or surface of rock. In certain situations, as where the ground is marshy, wooden Piles (q.v.) are used to carry walls. However dry the ground may be, a 'damp-proof course' should be formed a little above the level of the ground by levelling the walls and spreading a thin layer of asphalt over them, or by laying a course of glazed pottery slabs. The damp-proof course should be below the lowest flooring-joists. See FOUNDATION, and ASPHALT.

Walls.—For buildings such as churches and houses in most civilised countries, walls are nearly always constructed of brick or stone. But in Norway, Sweden, Russia, and Switzerland, as well as in parts of Asia and America, many houses, and in some cases churches, are erected entirely of wood (see CHALERT). Another way of constructing walls has been adopted largely in Europe, and to some extent in America. This consists of a concrete formed of sand, pebbles, broken stone, and lime mixed with water. It is a revival of an ancient Roman method, and, on the Continent especially, has produced satisfactory results. Steel concrete or reinforced concrete—the concrete, very deficient in tensile strength, being 'reinforced' with a network of steel rods—is now largely used for walls, floors, and partitions. Stone walls for ordinary houses are usually built 2 feet thick, but they are often made much thicker in the case of large public buildings. Their Masonry (q.v.) is either of Ashlar (q.v.) work or of Rubble (q.v.), jointed with mortar, which is also used for brick-work (see CEMENTS). The external brick walls of some houses are only 9 inches thick, but they should be at least 14 inches thick, especially if the building is two stories or more in height. They are often built hollow—i.e. with hollow spaces formed in their thickness—which tends to keep down damp (see BRICKLAYING).

Partitions.—On the ground-floor, and wherever strength of construction is required, these are best formed of brick, usually $4\frac{1}{2}$ inches, occasionally 6, and sometimes 9 inches thick. They are now occasionally built of hollow bricks. Wooden partitions are formed of upright quarterings or studs, called in Scotland standards, $4\frac{1}{2}$ by 2 inches, and from 12 to 14 inches apart, and covered with lath to receive plaster. In Great Britain these timber partitions are left hollow, but in Paris the quarterings are nailed over horizontally with strong oak laths a few inches apart, and all the interspaces filled in with

stone rubble. A plaster of Paris mortar is then pressed through the rubble, leaving as much body on the surfaces as will cover and imbed all the timber, and in this way form a solid partition.

Flooring.—The lowest floor, if formed of wood, should be above the level of the ground, should have a space below the joists, and air should be admitted by openings through the walls for ventilation. If this is not done, the timber is apt to be attacked by dry-rot, caused by a species of fungus. Floors near the level of the ground, when laid with flagstones, asphalt, or cement, require a six-inch layer of broken stones, covered with a bed of mortar or cement below them. All the floors of a house, except in some apartments of the lowest story, are usually formed of wood; but if they are of large size, the joists are often supported by iron beams (see GIRDER). Floors whose under sides form ceilings of rooms below them require to be 'deafened' with a layer of some mixture such as coarse plaster, mortar, and chopped straw, or of ashes and lime, under the flooring-boards. In large or important buildings floors are often constructed of either solid or hollow brick arches thrown between iron beams, in which case they are fireproof. See FLOOR.

Roofing.—For large spans iron roofs are a feature of the age, and the French have been particularly successful in the artistic treatment of this material; but wooden roofs are commonly put on ordinary houses. Where it is available, Slate (q.v.) is for the most part used to cover sloping roofs, but occasionally thin flagstone takes the place of slate. Tiles of red, blue, and other colours are now sometimes chosen, even for the roofs of public buildings, in preference to slate when colour effect is sought after. Flat roofs are covered with lead or zinc, the former being the more durable. The gutters, flushings, and generally the ridges of roofs, are of lead; but they are frequently made of zinc, which does not last long in large towns, although it is more durable in the country. Thatch, felt, Asphalt (q.v.), and wooden Shingles (q.v.) are all used to cover roofs; and glass is largely used in roofs of railway stations, exhibitions, and the like.

Joiner-work.—Doors, windows, shutters, and generally what are called the internal finishings of a house, are made and fitted up by the joiner.

Information on other points of interest will be found in the articles on Fire, Electric Light, Gas-lighting, Timber, Ventilation, Warming, and Water-supply, besides those already referred to.

Plaster-work.—The covering of the internal surface of walls, and the surface of partitions and ceilings with plaster, as well as the construction of the cornices and other modelled decorations of rooms in plaster of Paris, is done by the plasterer. The inside of external stone and solid brick walls should be strapped and lathed before being plastered, otherwise it is difficult to keep the plaster dry.

Plumber-work.—Much of the comfort of a house depends upon the efficiency with which the plumber does his work. The lead water-pipes should be placed in situations protected from frost, and they should be of a sufficient thickness to stand the required pressure. Lead piping is not very suitable for the conveyance of hot water (see LEAD). Easy access should be given to water-cisterns, in order that they may be frequently cleaned. All the fittings of cisterns, baths, and water-closets, and soldered joints everywhere, require the utmost care and attention. A very small hole, through which an almost invisible drop of water can escape, will often cause much damage before it is detected. The lead and zinc work of roofing noticed above is done by the plumber. Zinc baths are not so common as they were, enamelled iron ones being

preferred to them; but those made of strong earthenware, with a white glaze, are perhaps the best of all, as a glaze on burnt clay does not chip like an enamel on metal. Excellent kitchen-sinks are also made of glazed earthenware, but those formed of lead on a wood framing have also advantages, and have been longer in use. Such questions as the non-desirability of having fixed wash-hand basins in bedrooms, and the trapping of pipes which enter drains, will be treated of under the head SEWAGE.

Gas-fitting.—The gas-pipes of a house should be of tin, as it is harder and stands much better than the cheap composition tubing, made of a mixture of lead with other metals, now so much used. Unless they are formed of iron, gas-pipes should be placed in protected channels, and not exposed on the surface of walls. Leaks in tin or other more or less soft-metal pipes are frequently caused by the carelessness of joiners driving nails through them. It occasionally happens that rats gnaw through these kinds of pipes when they are in their way, and they more frequently destroy lead water-pipes in the same manner. In order to be sure that the gas-pipes in a house are perfectly airtight, they should be tested with a force-pump and an indicator.

Glazing.—Windows of houses are most commonly glazed with sheet-glass varying in weight from 15 to 26 ounces per superficial foot. Thicker kinds are made for very large-sized panes. When plate-glass is used, it is generally about one-fourth of an inch thick. In some shop windows it is considerably thicker. Few persons, except those who have much experience in the matter are aware how great is the difference in the qualities of plate-glass. Some kinds will keep clean six times as long as others under precisely the same circumstances. The qualities of sheet-glass also differ considerably, but it is much more easy to select good glass of this kind. See GLASS.

Painting and Papering.—The painting or papering of plastered walls should not be attempted till they are thoroughly dry. Paint greatly helps to preserve external wood-work, and it is equally necessary to frequently renew the painting of light railings or balcony panels, if they are made of malleable iron. Inside work, such as doors, shutters, architraves, window-breasts, and walls (if not papered), should get at least four coats of oil-paint. Frequently these finishings receive three coats of varnish instead of paint, if it is desired to show the grain of the wood. It is often the case that a first coat of glue-size is substituted for one of varnish, which makes an inferior job.

Building Materials.—Building stone, brick, terracotta, cement, and concrete are noticed under their respective heads. In the better class of houses the roof timbers, joists, window-frames, and other external wood-work are made of what is known in commerce as Baltic redwood, which is imported from Danzig, Riga, Petrograd, and other places on the Baltic. It is the product of the Scots pine (*Pinus sylvestris*). This wood when grown in Great Britain is not so valuable for building purposes as the imported timber. It is a moderately heavy, resinous, durable, and easily worked wood (see PINE). For room-doors, shutters, dados, and other internal work, the wood of the American yellow pine (*Pinus mitis*) is very generally used. It is an excellent timber for these purposes. Californian redwood (*Sequoia sempervirens*) is now, to some extent, used in Great Britain for the same kind of work as yellow pine. The pitch pine (*Pinus rigida*) of the United States yields a very resinous wood with a showy grain, which has also been occasionally employed for the joiner-work of houses in England.

An inferior wood, imported from Danzig, called whitewood, and said to be obtained from a species of spruce, has of late years been largely used for joists and roofing, owing to the comparatively high price of Baltic redwood. This whitewood is also, to some extent, employed for the internal finishings of rooms. Oak, mahogany, and other hard woods are only in request for parts of exceptionally important and costly buildings.

Machane-work.—Machinery is now extensively employed for sawing and cutting ordinary limestone and sandstone, as well as granite and marble (see article STONE). The sawing, planing, moulding, mortising, tenoning, dovetailing, and turning of wood is likewise executed on a large scale by machine tools. Sash and door clamping machines are also in use, so that in the workshops of many large builders hand-work on doors, window-sashes, and frames is reduced to a minimum.

See the South Kensington *Notes on Building Construction* (1872) and *Advanced Building Construction* (1872); Kidder, *Building Construction* (N.Y. 1898); Pite and others, *Building Construction* (1911); Gourlay, *The Construction of a House* (1911); and books named at CONCRETE.

Building Leases. Under a variety of statutes in England and Scotland, the crown, represented by the Commissioners of Woods and Forests, heirs of entail under strict settlement, the Ecclesiastical Commissioners, the great university corporations, mortgagees in England, are authorised to grant building leases for ninety-nine years. The term of ninety-nine years has thus come to be associated with building leases, but such leases are granted for various periods. In England it has been decided that municipal corporations cannot at common law grant building leases for more than seventy-five years. In the case of the Montgomery Act, passed for Scotland in 1770, very stringent conditions were laid down as to the number of houses and the extent of ground, but these have been practically superseded by later legislation. It is much questioned whether the building lease is a convenient and economical tenure in towns. In the United States, building leases include repairing leases, and may continue for any term of years agreed upon by the parties, no time being specified by State or United States law. See GROUND-RENT, LEASE.

Building Societies in the United Kingdom were formerly regulated by an act passed in 1836. This act (the Benefit Building Societies Act) empowered such societies to raise a fund by periodical subscriptions for the purpose of enabling the members to erect and purchase dwelling-houses, or acquire other real or leasehold estate, to be mortgaged to the society until the amount or value of the shares drawn on should be fully repaid with interest and all other appropriate payments. A share was not to exceed in value £150, and the corresponding monthly subscription was not to be more than twenty shillings. A majority of the members might make rules and regulations for the government and guidance of the society, such rules not being repugnant to the provisions of the act or to the general laws of the realm. No member was to be allowed to receive any interest or dividend on his share until the same had been realised, except on the withdrawal of such member according to the rules of the society.

After an elaborate inquiry by Royal Commission, with which the name of Sir Stafford Northcote (Lord Iddesleigh) is connected, the Building Societies Act was passed in 1874, and amended in 1875, 1877, 1884, 1894. Regulations are issued from time to time by the Home Secretary, and the Court of Session framed an act of sederunt regulating the liquidation proceedings of Scottish societies

in the Sheriff Court. The Act of 1874 enlarged and modified the scope and powers of building societies. Societies already in existence were given the option of becoming incorporated under the Act of 1874 or of remaining unincorporated and continuing under the old laws superseded by that act; all societies established after 1874 must be incorporated and be bound by the new legislation. Non-incorporated societies are termed 'Benefit Building Societies.' A distinction is also drawn between permanent societies and terminating societies 'which by their rules terminate at a fixed date or when a result specified in the rules is attained.' Section 13 declares that any number of persons may establish a society, either terminating or permanent, for the purpose of raising, by the subscriptions of the members, a stock or fund for making advances to members out of the funds of the society, upon security of freehold, copyhold, or leasehold estate, by way of mortgage; and any society under the act may from time to time raise funds by the issue of shares of one or more denominations, either paid up in full or to be paid by periodical or other subscriptions, and with or without accumulating interest, and may repay such funds when no longer required for the purposes of the society. It will be seen that the restrictions of £150 and twenty shillings have disappeared, the contributions and ultimate value of a member's interest being at his own discretion. The liability of members, in respect of shares upon which no advance has been made, is limited to the amount actually paid or in arrear thereon; and in respect of shares upon which advances have been made, is limited to the amount payable under any mortgage or other security, or under the rules. Societies are empowered to receive deposits or loans, from members or other persons, corporate bodies, joint-stock companies, or terminating building societies, provided, in the case of permanent societies, that the total amount owing at one time shall not exceed two-thirds of the amount for the time being secured to a society by mortgages from its members; and in the case of terminating societies, shall not exceed two-thirds as aforesaid, or a sum not exceeding twelve months' subscriptions on the shares for the time being in force. Societies established under or adopting the Act of 1874 are bodies corporate, having perpetual succession and a common seal, thus dispensing with the cumbrous and inconvenient system of trusteeship. Their rules must specify the society's name and place of meeting; mode of raising funds, with their purposes and mode of investment; terms of withdrawal and repayment; manner of alteration of rules; the appointment, remuneration, and removal of officers; provisions as to general and special meetings, and the settlement of disputes, custody of seal, mortgage deeds, and securities, powers of directors and other officers, fines, and mode of dissolution. Societies may unite with others, or one society may transfer its engagements to another. They may purchase, build, hire, or take on lease any building for conducting their business. Minors may be members, but cannot vote or hold office during nonage. Accounts are to be furnished to members and loan depositors annually. The societies are exempt from stamp-duties of every kind, except those upon mortgages. The failure of the Liberator Society (incorporated under the Act of 1874), with total liabilities to depositors and shareholders amounting to over £2,300,000, nearly the whole of which was a total loss, occurred in 1892. The failure was caused by speculations outwith the proper sphere of a building society, and resulted in a loss of confidence in all such societies. A consequent run on the Birkbeck Society by depositors caused the withdrawal of

£1,578,000 within a few days. An inquiry by the government was followed by the passing of the Act of 1894. Under it all the societies established after 1856, but still remaining under the Act of 1836, were bound to be incorporated under the Act of 1874. The act prohibits in future societies the balloting for advances, and provides a method whereby the balloting in certain existing societies may be abandoned. The Registrar may, on the application of ten members, appoint an inspection of the books of any society, and on the application of a tenth of the whole members, cause an investigation as to whether the society should be wound up. Other points put on a more definite footing than previously are the raising of stock, the terms of advances and their repayment, unadvanced subscription shares, withdrawals, paid-up and preferential shares, the borrowing of money, the ascertaining and providing for losses.

The compulsory winding-up in 1911 of the two Birkbeck societies (established 1851-52) greatly diminished the importance of unincorporated societies, and checked the steady recovery in membership which English building societies had maintained since 1901. The original Birkbeck Society since 1871 had enormously developed its banking business, while its purely building business remained almost stationary; in 1910, out of 11 millions sterling due to depositors, only £750,000 was on mortgage securities, the remainder being represented by investments in miscellaneous securities and cash. Depreciation of securities led to the suspension of the Birkbeck Bank. The Court of Appeal decided that the extensive banking business of the society was *ultra vires* of the directors. The Registrar (who has no say in the original rules of unincorporated societies) reported in 1912 that he considered it improbable that any of the surviving unincorporated societies engage in banking business. No rules can be registered enabling an incorporated building society to carry on any other kind of business such as banking or fire insurance, to make advances to non-members, except by way of investment of surplus funds, or to acquire and permanently possess land generally.

Since 1894 the number of building societies has greatly decreased, owing mainly to the gradual working out of terminating societies, without being replaced, and the absorption of business by the bigger permanent societies. The building society movement, whose aim is to enable every man to become his own landlord, cannot but be affected by present and future attempts to solve the housing problem generally.

The Starr-Bowkett Society is one form of the terminable building society. In the original Bowkett type the subscriber lends the society a small sum annually for a very long time, say 31 years, and the society lends him a large sum for a short time, nominally without interest. In the Starr form, after a member has repaid money lent to him on property, he has to pay an increased subscription, so as to make the society terminate sooner. The advantage of these societies depends on whether the member gets his loan early or late.

In the United States, 'building and loan associations' are private corporations giving a safe means of accumulating savings and securing loans at reasonable rates for building homes, and include organisations such as mutual loan associations, homestead aid associations, co-operative banks, and building societies. Borrowers wishing an advance take shares to the value of the loan required, and often a premium has to be paid in addition. A mortgage on the property forms the security. The first association was organised in Philadelphia in 1831. They are most common in Pennsylvania and Ohio.

See the four reports of Royal Commission on Building Societies from 1871 to 1874, with the local reports of assistant-commissioners; annual reports of the Registrar of Building Societies, and works by Scratchley and Brabrooke, Wurtzburg, Starr, Dexter, Thompson, &c.

Building Stone. No artificial building material such as brick, terra-cotta, or cement can give dignity and beauty to an edifice in anything like the same degree as an ordinary limestone or sandstone which can be cut by a chisel. Much less can burnt clay or artificial stone, no matter how much it is enriched by ornament and colour, approach marble, granite, or porphyry in giving a noble character to an architectural monument. By far the most common kinds of building stone are sandstones and limestones. The term freestone is applied indifferently to such examples of both kinds as dress freely with masons' tools. Both are bedded or sedimentary rocks, and both as a rule, when cut up into blocks for building, should be laid on their natural beds. See also **STONE**.

Sandstone.—Rock of this kind suitable for building is found plentifully in some parts of England, but principally in the central and northern counties, though it also occurs in Devonshire and Monmouthshire. Among numerous quarries it will suffice to name Darley Dale and Bakewell Edge in Derbyshire, Longridge Fell in Lancashire, Viney Hill in Gloucestershire, Bidston Hill in Cheshire, Addingly in Yorkshire, and Hadley in Worcestershire. There are several well-known quarries about Newcastle-on-Tyne, and sandstone of a pleasing red colour occurs at Penrith and other places in Cumberland. These English sandstones are obtained from the Devonian, the Carboniferous, the Permian, and the New Red Sandstone formations. It is from the 'millstone grit' division of the Carboniferous that the stone for many of the public buildings in Manchester, Bradford, and Leeds was obtained. So far as can be judged from the appearance of comparatively modern edifices, the stone stands the smoky atmosphere of these towns very well. Ancient buildings in England, however, do not on the whole show that any sandstone used in them resists decay for centuries. Durham and Chester cathedrals and numerous small churches furnish examples of this.

All the towns of any size in Scotland, except Aberdeen and one or two small places, such as Dalbeattie in Galloway, are built of sandstone. So are almost all the ancient buildings of any note. The stone is chiefly obtained from the Carboniferous and Old Red Sandstone formations, but the Permian rocks of Cumberland being prolonged into the county of Dumfries, some fine red sandstone is got there from that formation. In Scotland, accordingly, there is ample means of judging of the durability of this building material, which is on the whole so suitable for architectural purposes. It is vexatious in the extreme to have to say that much of the beautiful carved work at Kirkwall, Holyrood, Melrose, Kelso, and Jedburgh is quite wasted by decay. The age of the oldest of these abbeys is but little more than 700 years. Many modern buildings likewise show that, even when believed to be carefully selected, this material is often not durable.

So far as is known, the sandstone from Craigleith Quarry, near Edinburgh, resists atmospheric agencies better than any other in Scotland, or perhaps in the British Islands. A great part of the New Town of Edinburgh has been built of it. More recently, Binny Quarry in Linlithgowshire, the stone from which stands next in quality to Craigleith, has supplied the material for the principal buildings erected in the Scottish metropolis, and to some extent also for buildings in Glasgow; but for some years, owing to the unfavourable

state of the quarry, it has yielded only a trifling supply. The cost of working Craigleith is double that of any other Scottish sandstone that would do for a fine building, and consequently no architect has for many years ventured to use it. Binny stone can only be got with difficulty. There are, however, plenty more quarries all through the length and breadth of Scotland, except in the north-west. Strange to say, not one of them, especially in the central part of the country, can furnish a stone upon which an architect can rely as being certainly durable. Yet so strong is the desire to have ornament for merely present appearance, that large quantities of building stones are now being brought from great distances both to Glasgow and Edinburgh, simply because they are of fairly uniform colour and can be cheaply worked.

Sandstones, being composed of grains of quartz, are highly siliceous. Darley Dale contains 96 per cent., Craigleith 97 per cent., and Binny 92 per cent. of silica. Some, however, have not more than 80 per cent. of this substance. The other substances they contain are chiefly carbonate of lime, alumina, and oxide of iron. It is hardly possible to tell a good sandstone merely by chemical analysis. A hard non-porous stone is, of course, more likely to be lasting than one which is soft and porous. There are a number of ancient buildings on or near the banks of the Rhine, between Basel and Cologne, which show the durability of a sandstone in a northern climate better than any in Great Britain. In these it is of a hard nature. See **SANDSTONE**.

Limestone.—Marble and chalk are the purest limestones, but it will be convenient to notice first those more or less composite limestones which are sufficiently hard and strong for building, yet not highly crystalline like marble. One of the best-known kinds of English building stone is the dolomite, or magnesian limestone of the Permian formation, which ranges from Nottingham to Tyne-mouth. It is a double carbonate of lime and magnesia, containing a varying proportion of silica. At Mansfield in Nottinghamshire, the amount of silica is exceptionally high—viz. 50 per cent., while at Bolsover and Mansfield Woodhouse it is only 4 per cent. The Houses of Parliament are built of this dolomite, which unfortunately decays rapidly under the influence of the London atmosphere. Among ancient buildings, some parts of York Minster show its perishable nature. Yet in Conisborough Castle, built in the 12th century, and in some country churches nearly as old, it has stood the effects of time very well.

The limestone of the oolitic formation, which extends from Dorsetshire into Yorkshire, is obtained for building purposes, for which it is extensively used, at several well-known quarries, such as those of the Isle of Portland, Bath, and Leckhampton Hill in Gloucestershire, Barnac in Northamptonshire, and Ancaster in Lincolnshire. The Bath stone contains 95 per cent. of carbonate of lime; and the Portland stone, which, though belonging to the same formation, is not of oolitic structure, contains the same percentage of that carbonate. The former has besides 2½ per cent. of carbonate of magnesia; the latter 1·2 per cent. of this substance, and the same amount of silica. Small quantities of alumina, iron, and water are present in both. Much of the oolitic limestone is easily cut with a saw when newly quarried, but it hardens on exposure, and is fairly durable. Like the dolomite above mentioned, it is very suitable for enriched as well as plain work, and is of a pleasing colour. Some ancient structures built of the oolitic limestone of their own neighbourhood are in a good state of preservation. Among these

are Lincoln Cathedral, some churches at Oxford, and Wells Cathedral. There are others, however, which have not so well resisted decay. St Paul's Cathedral, London, is built of Portland stone. Kentish rag is an impure limestone, compact, heavy, non-absorptive, and difficult to dress. It is used in London chiefly for rubble work, and is very durable.

There are extensive deposits of limestone in England, Scotland, and Ireland, which are only fit for burning into lime, or at least are not suitable for the hewn work of buildings.

The fine limestone from Caen in Normandy is much used for internal architectural work in England, and to some extent even in America. It is a fine-grained, easily chiselled, beautiful material, of a creamy-yellow uniform colour. But in external work it is very liable to decay, especially in towns. In the middle ages it was employed for some cathedrals—that of Canterbury, for example—as well as for smaller churches in the south of England. Travertine is a peculiar kind of limestone believed to be formed by precipitation from water containing lime. It is somewhat cellular in structure, of a buff colour, and very durable in Italy, where, in Rome especially, it has been extensively employed for both ancient and modern buildings, among others the Colosseum and St Peter's. Nummulitic limestone is chiefly composed of beautiful fossil-like coins or buttons of filigree work. Some of the Egyptian pyramids are built of this stone. See NUMMULITE.

Marble.—In the British Islands marble is only used for the decorative parts of buildings. White marble is found in Skye, Sutherland, and one or two other places in Scotland. It also occurs in a few localities in Ireland; but it is doubtful whether it would be profitable to work it in either country. Coloured marbles, some of which are handsome, are regularly quarried in Devonshire, and also in Derbyshire, where they contain shells, encrinurites, and other fossils, which give them an attractive appearance when polished. Ireland is comparatively rich in coloured marbles. The wavy and mottled green serpentine marble of Connemara is a very beautiful stone. Black marble is worked in Kilkenny and other counties, and a veined red marble in Cork. Italian and other foreign marbles are, however, more used in the United Kingdom than the native kinds. See MARBLE.

Serpentine.—This has a general resemblance to coloured marble, but it is of quite different composition, being a silicate of magnesia. Cornish serpentine is perhaps the most beautiful ornamental stone in the British Islands. It is principally used for internal decoration. Serpentine is found in Banffshire and in Shetland, but only pieces of limited size can be got. See SERPENTINE.

Granite.—In the granite districts of Great Britain, the stone is used for ordinary building purposes. Aberdeen, for example, is almost wholly built of this material. It is usually only hammer-dressed, but even with the rough face so imparted, it gives a building a good appearance. For decorative purposes it is polished. Peterhead and Ross of Mull are red granites, while the Aberdeen, Dalbeattie, and Creetown varieties are gray or bluish gray. Peterhead granite especially is a good deal used in London and other large towns in the British Islands for some of the more prominent features of buildings, and is also sent to America. The Cornish granites have been much employed for bridges over the Thames, and for docks and breakwaters. There are some good granites in Ireland. See GRANITE, and SYENITE.

United States.—Many excellent building stones are found in America. The quarries of Maine have

been the chief source of the supply of granites; and of those from this state the Calais variety is red, and that from Spruce Head gray, both of these taking a fine polish. The granite from Hallowell, also in Maine, is remarkable, as its dressed surfaces are nearly as white as marble. New Hampshire, Vermont, Massachusetts, Connecticut, Rhode Island, and several other states contain granite. Sandstones constitute the most valuable group of building stones in the United States, as they have a wide distribution, have much diversity of tint and texture, and can be comparatively cheaply obtained. They are principally of triassic and carboniferous age. White marble has been quarried on a considerable scale for important public buildings. That from Lee, Massachusetts, which is strong and durable, was used in the construction of the Capitol at Washington, and for the city hall at Philadelphia. From Stockbridge, in the same state, the marble was got for the state-house at Boston and the city hall of New York. Tuckahoe marble, which is pure white, strong, and coarse-grained, has been employed for some of the finest buildings in New York. For St Patrick's Cathedral a pure white dolomite called 'snowflake marble,' from Pleasantville, New York, has been chiefly used. Rutland county, Vermont, is the great centre of the marble industry for purely decorative purposes. Numerous beautiful coloured marbles have been discovered in the United States.

Stone-dressing.—Ashlar stones (see MASONRY), whether of limestone or sandstone, after being chiselled on the face, generally get the tool-marks removed by smoothing them with a bit of soft sandstone and water. In England a stone so finished is technically said to be *rubbed*; in Scotland, *polished*. It has, however, become the custom in Scotland, where sandstone is the only freestone, to dispense with the 'polishing' and leave irregular chisel-marks visible. In former years there were in use various effective ways of dressing stones for the fronts of buildings. One of these was *tooling* or *drowing*—i. e. covering the face with small flutings by means of a broad chisel; another was *broaching* or incising the face with narrow parallel grooves by the use of a pointed tool. Many buildings of a by no means unpretentious kind recently erected in Scotland and elsewhere have their ashlar stones dressed only on their beds and joints, their faces being merely 'pinched' from the edges, leaving the exposed part of the stones rough and hackly. When the face of granite is not polished it is generally dressed with a nidding hammer, which gives it a chiselled appearance.

Preservation of Stone.—The preservation of stone can be effected to a great extent by coating the surface with boiled linseed-oil, or with oil-paint; but these methods are not much in favour, as they destroy the crystalline appearance which constitutes the beauty of most natural stones. There is, however, no other efficient way known of preserving a sandstone with a tendency to decay. More hope may be entertained that certain chemical solutions will prevent the wasting of oolitic and magnesian limestones much used as building stones in London and southern England generally. The coating of these with an alkaline silicate and the subsequent application of calcium chloride, as proposed by Ransome, has not had the beneficial result which was expected from this treatment. Another method is to use an alkaline silicate alone, leaving the carbon dioxide of the atmosphere to act. Baryta water can be applied to crumbling limestone. Bath stone (oolitic) and other building materials have been treated with a silicious preserving solution under the name of 'Fluate.' The

preservation from decay of a porous substance like freestone (whether sandstone or limestone) in a climate like that of northern Europe is a problem of the greatest difficulty. One precaution ought never to be neglected, and that is to see that a 'damp-proof course' is put through the walls of a building just above the ground, to prevent the ascent of moisture from the soil. See BUILDING.

Artificial Stone.—Burnt clay in the form of bricks or terra-cotta blocks of larger size, though not usually classed as artificial stone, is by far the best substitute for real stone. Portland Cement (q.v.), mixed either with sand alone or with sand and broken stones, forms one kind of artificial stone (see CONCRETE). In the north of Italy paving tiles with beautiful patterns are made by inlaying Portland cement with small pieces of marble, serpentine, and other ornamental stones. This kind of work is obviously suited for external wall decoration of a very effective kind, provided that even the best Portland cement has the durability which some of its advocates claim for it. Scagliola (q.v.) is a polished plaster for internal decoration, somewhat similarly ornamented. Von Fuchs of Munich, Kuhlmann of Lille, and Ransome of Ipswich have successively done material service in enabling an artificial stone to be made of the silicate of soda or potash (soluble glass or water-glass) and sand (see GLASS). Ransome's artificial stone is a hard substance formed by mixing sand with a solution of this alkaline silicate, then pressing it into moulds, and when partially dry soaking it in a bath of chloride of calcium, which to some extent penetrates the 'stone,' forming the insoluble silicate of lime (calcium silicate). Chimney-pieces, vases, and architectural ornaments of various kinds have been made of this material. Ransome's 'patent concrete stone' is made in the same way, with broken pieces of stone added.

Buitenzorg, capital of a sub-residency in Java, 35 miles S. of Batavia by rail, stands in mountainous country, 880 feet above the sea, and has so fine a climate that it is becoming more and more a favourite summer resort of the Batavian merchants. The splendid country palace of the governor-general is here, and around it an extensive and famous botanic garden. Pop. 34,000.

Bujalan'ce, a city of Andalusia, Spain, 25 miles E of Cordova. It has an old Moorish castle, and manufactures of leather and woollen cloth. Pop. 10,000.

Bukarest, Bukharest. See BUCHAREST.

Bukkum Wood. See BRAZIL-WOOD and SAPPAN-WOOD.

Bukkur, a fortified island of the Indus, in Sind, between the towns of Rohri and Sukkur. Composed of limestone, it is 800 yards long and 300 broad, and rises 35 feet above the stream. The great Lansdowne cantilever railway bridge (completed 1889) across the Indus here, which is 1200 feet long, takes advantage of the island.

Bukovina ('beech-land'), a former crown-land of north-eastern Austria, now mainly Rumanian, though much of it is claimed by Ukraine. It is traversed by offshoots of the Carpathians, culminating at 6077 feet; gives rise to many rivers flowing towards the Black Sea; and abounds in wood, along with considerable mineral riches. Large numbers of cattle are reared, and also excellent horses. The Bukovina, according to many Austrian historians, was wrested from Transylvania in 1482 by Moldavia; but it had long before formed an integral portion of the latter state, whose fortunes it shared till, in 1775, it was ceded by the

Turks to Austria. For a time it was united to Galicia, but in 1849 was made a separate 'crown-land,' or province, and was officially still a duchy. In the Great European War it was the scene of much fighting between the Russians and Rumanians and the Austrians and Germans. In November 1918 it was united with Rumania. Austria thus lost an area of 4000 square miles, with some 800,000 inhabitants. Of these about two-fifths were said to be Ruthenians, over a third Rumanians, one-fifth Germans. Most of the inhabitants are of the Greek Church. Czernowitz (Cernauti) is the capital.

Bulacan, a town of Luzon, Philippines, at the head of the bay of Manila, and 20 miles NW. of the city of that name; pop. 15,000.

Bulandshahr, a British district in the Meerut division, United Provinces of India, with an area of 1900 sq. m., lying between the Jumna and the Ganges. It forms a part of the Doab, and presents the aspect of a monotonous cultivated plain, with an average elevation of 650 feet above sea-level. The Ganges Canal passes through the district from north to south, and artificial irrigation has made many unpromising areas fruitful. More than one-fourth of the cultivated area is so supplied. Cereals, safflower, indigo, cotton, and wool are exported. The East India Railway passes through Bulandshahr, the Oudh and Rohilkhand Railway crosses its south-east corner. The most important towns are Khurja, Sikandarabad, and Bulandshahr or Baran. This last, the administrative headquarters, is a place of great antiquity, coins of Alexander the Great being still found there. Pop. of town, 20,000; of district, 1,124,000.

Bûlâq, or BOULAK, the port of Cairo, on the Nile, opposite an island of the same name, is now a mere suburb. Here was formed by Mariotte Pasha the national museum of Egyptian antiquities, removed in 1889 to Gizeh, and now in Cairo.

Bulawayo, or BULUWAYO, chief commercial town (but not capital) of Southern Rhodesia, 400 miles W. of Beira, is connected by rail with Capetown, Beira, and Katanga, and is the seat of the Rhodesian Museum; white pop. 5000.

Bulb. Our perennial herbs which die down during the winter have always accumulated during the summer some store of reserve material (starch and nitrogenous matters) which serves as capital upon which to draw for their new and rapid start

in spring. This subterranean store may be deposited in roots (e.g. orchids), in an underground creeping stem (e.g. rhizome of iris or primrose), in definite portions of rhizome which are then called *tubers* (e.g. potato, Jerusalem artichoke), or in the lower portion of the main axis (*corm* of crocus), which thus assumes a bulbous form (see ROOT, RHIZOME, TUBER, CORM). The term bulb is, however, restricted by botanists to those cases in which the store is deposited

Fig. 1.—Bulb of *Allium ursinum*:

a, side view; b, front view; c, section.

the leaf-bases, or in modifications of entire leaves. The incipient bulb is best seen in the common wood-garlic (*Allium ursinum*), in which the store is deposited in the swollen spindle-shaped base of a

foliage leaf (fig. 1). The first leaf of the following year's growth is not swollen, but almost completely insheathes the developing flower axis, the first foliage leaf of which again thickens as the bulb, and develops in its axil the bud of next year. From such a simple form transitions in all directions are easy: thus if we increase the number of leaves, and unite without greatly thickening their sheathing bases, we have the incipient bulb of the leek. Here the store is deposited along an indefinite extent of leaf-base, which the gardener accordingly artificially extends by hoeing up earth around the plant, and so arresting vegetation in the blanched portion and giving us the succulent parenchymatous esculent which is so familiar in cookery. In the onion or hyacinth, however, the area of storage becomes clearly marked off, and in autumn the vegetative portion of the leaf dies away, leaving the successive leaf-bases overlapping each other around the

Fig. 2.

excessively shortened disc-like axis. This is the so-called tunicated bulb (fig. 2).

In almost all forms of this, one or more of the lowermost leaves of the axis cease to appear above ground; and in some cases (e.g. *Lilium candidum*) where the bulb is made up of more than one year's growth, it is composed of first the thickened leaf-bases of a previous year; next the short, thick, scaly leaves of the lower portion of the axis; and within this the swollen leaf-bases of the upper portion (fig. 2, c). This leads to the case presented by other lilies (e.g. *L. martagon* and *bulbiferum*) in which the foliage leaves are restricted to the upper portion of the axis, and the leaves of successive years forming the bulb are all subterranean and reduced to swollen overlapping scales. This is the so-called scaly bulb.

In some cases many new daughter-bulbs may develop in the axils of the leaves composing the parent bulb; such are the so-called cloves of garlic (*Allium sativum*). Tunicated bulbs are hence sometimes propagated by cutting across transversely; a series of axillary buds is thus compelled to arise. In *Lilium bulbiferum* the same principle appears, and in its simplest form; for the buds in the axils of the foliage leaves are developed as small bulbs (bulbils), and these readily fall off and take root. In other species (*A. Schcenoprasum*, *A. fallax*), we find incipient cases of bud formation along a rhizome; and this becomes strongly marked in the common *Saxifraga granulata*, of which the crowded bulbs are not unfrequently mistaken for mere tuberous swellings along the roots, until dissection proves that we have to do with the bulbous buds of spreading rhizomes.

The use of the bulb to the plant, as affording at once a citadel of refuge during the severity of the winter of cold climates, or of the dry season of warmer ones, and a store of materials for a vigorous start in spring before the competition of other plants has become active, will be sufficiently obvious; and the importance of bulbous plants in such peculiar climates as that of Siberia or of the Cape of Good Hope is thus readily accounted for. The large nutritive store gives a proportional possibility of reproductive outlay, and the remarkable size and beauty as well as the earliness of flowering of most bulbous plants is thus explained. For all these reasons, as well as the ease of their cultivation, preservation, and transport, they have always been greatly valued by the florist; their nutritive store in some cases makes them valuable and savoury articles of food; while others—such as that of the Squill (q.v. *Scilla*)—contain also products of vegetable waste, which have turned out to be of medicinal importance.

Bulbul, a Turkish name (used also in Persian) for the nightingale, which has found its way into English poetry through Moore's and Byron's patronage. But the same name is given in India to a very different bird, *Pycnonotus hamorrhous*, usually ranked among the babbling thrushes (Timeliæ). It is a little bird of brilliant plumage, and the male has a crest or tuft on its head. It is remarkable for its pugnacity; the Singhalese consider it the most game of all birds. Its powers of song have also earned for it the name of 'Ceylon nightingale.' The name bulbul is also applied to related forms like the Bristle-necked Bulbul (*Criniger*) in Western Africa, India, &c., and the Red-whiskered Bulbul (*Otocampus jocosus*) of India and Burma.

Bulgaria, in theory a constitutional monarchy, is situated south of the Danube and west of the Black Sea. Geographically, it is split up into three zones running from east to west. Of these the most northerly, contained between the Danube and the Balkan Mountains, existed from the year 1879 until October 1908 as an autonomous principality under Turkish suzerainty. The central belt lies between this chain and the mass of the Rhodopes, and was governed as an autonomous province under the name of Eastern Rumelia down to the 18th September 1885, when it was united with the principality in consequence of a revolution. The third strip has varied with the fortunes of war. The whole region extending southwards to the Ægean Sea, and comprising the hotly contested provinces of Macedonia and Thrace, together with the important ports of Salonika, Kavalla, and Dedeagatch, Bulgaria had earmarked for herself as her share of the fruits of the first Balkan war; but it was divided up among several states as a result of the second campaign, and again after the world-war. Since 1914 Bulgaria has made strenuous endeavours to have this territory redistributed in her favour.

The entire country is watered by many streams, which intersecting mountains—often forest-clad as high as 1900 feet above sea-level—keep from meeting and commingling. Alone the Iskei, which takes its rise in the Rylo, flows through nearly the whole width of Bulgaria.

The climate, which is continental, differs according to the zones, and the soil, watered by streams, rains, and snow, and warmed by a fierce summer sun, produces in abundance wheat, maize, barley, tobacco of good quality at the base of the Rhodopes and in the Haskovo district. Grapes grow on the hillsides at an altitude of 500 feet above the level of the sea, and the fruits of Kustendil and the roses of Kazanlik, cultivated by the most skilful gardeners of eastern Europe, enjoy a

wide reputation. Waste, neglect, and mining requirements have stripped the country of many of the dense forests with which it once was covered. None the less, oak and beech forests still flourish in the north, the former at an altitude of 700 metres and the latter at 1300; while the south possesses considerable forests of conifers. Altogether the wooded districts of the central zone occupy no less than 30 per cent. of the entire area, and timber is one of the exports of the country.

Bulgaria's fauna differs little from that of central and southern Europe. Among the wild beasts and birds of prey may be mentioned the bear, the wolf, the jackal, the wild boar, the eagle, the falcon, and the owl.

The fertility of the soil, taken in conjunction with the Spartan frugality of the people, is deemed adequate to support a population from four to five times greater than the number of its present inhabitants, which is nearly 5,000,000. Large estates have ceased to exist since the departure of the Turks, who, after the war of 1878, sold their possessions for what they would fetch to village communities, which divided them into lots among their own members. To-day the land is cut up into small holdings, mostly of from two and a half to five acres. The proprietors are chiefly peasants. Under these conditions the methods of cultivation are primitive, and the soil, which is generally very fertile, is but superficially ploughed. As a considerable percentage of the soil not yet under cultivation is capable of being tilled, the government encourages initiative in this direction. The results are encouraging. Between the years 1903 and 1912 the area of cultivated land rose from 3,155,000 hectares to 4,296,000, besides which the yield also augmented considerably. Assistance is likewise afforded in other ways by the Agrarian Bank, which, by advancing personal loans, mortgage loans, and loans on such security as agricultural produce, seeds, cattle, &c., and at fair rates of interest, keeps the peasantry from the clutches of the money-lender. This institution also purchases for farmers perfected implements and machines, fine breeds of cattle, and other requisites, and advances money to co-operative associations for the betterment of agriculture.

The main source of Bulgaria's revenue is, and will long remain, the fertility of her soil. Out of every 10,000 Bulgars, 8600 are occupied in agriculture or in agricultural industries. This fact has been recognised by all political parties as the cornerstone of their policy. For industry has such formidable obstacles to surmount, owing to the lack of capital, labour, and coal, that the repeated efforts of the authorities to foster it by legislation have produced but slender results. Skilled labour can hardly be said to exist. The peasant is willing to work in a sugar factory, a brewery, or a distillery, but only on condition that he shall be free to attend to his farm at the various seasons when it needs his care. The state encourages industries and prefers the native to the foreign product, even when price and quality are on the side of the latter. None the less, however, industry is still in an inchoate state. Even coal, which is worked at Pernik, near Sofia, is expensive, as well as of inferior quality. It is worth noting, however, that textile fabrics are exported to Turkey, and that during the Balkan war the Turkish soldiers were clad in cloth woven by their enemies.

Bulgaria's commerce consists in the exportation of agricultural produce, and the importation of raw materials and manufactured goods. Despite serious obstacles it has made progress proportionate to the political expansion of the realm.

The artificial ways of communication are inadequate

and defective; the natural waterways, on the contrary, are good. About half of the traffic is transported over the Black Sea, where Bulgaria has two ports—Burgas, which, at first atrophied by the prohibitive tariffs of the Oriental Railway Company, has been employing considerable activity since 1908, when it became Bulgarian; and Varna, the importance of which is dwindling since the Dobrudja was ceded to Rumania in 1913. The Danube, which bounds the kingdom on the north, is less serviceable to Bulgarian commerce than it may seem, owing to its being blocked with ice for several weeks every year, and to the slowness of navigation against the stream. None the less, a fourth part of the traffic is borne on this river. Land routes absorb the remaining fourth of Bulgaria's traffic in spite of the heavy toll it pays in passing through the territories of trade competitors. The port of Dedeağatch, which was allotted to Bulgaria by the treaty of Bucharest, was lost by that of Neuilly in 1919.

The population of the Bulgarian kingdom before the Balkan wars was 4,329,108. The number of inhabitants who passed under Bulgaria's sway with the territory annexed in August 1913 was 709,646. From the total must be deducted the 285,757 subjects whom Bulgaria lost to Rumania by the cession of the Dobrudja. Cessions to Serbia and Greece in 1919 cost her about 112,500 and 320,000. The 1920 census gave a total of 4,861,439. The fecundity of the Bulgarian people is considerable. The census, which is taken every five years, shows a regular average increase of 10 per cent. The loss of about 100,000 men who were killed or crippled in the two Balkan campaigns was less acutely felt in the economic life of the nation than might have been anticipated. For the land owned by peasants being cultivated by the combined labour of the whole family, if one member disappears, the others work a little harder to achieve the same results. Thus when the able-bodied men were at the war the seeds were sown by women and children; and later on, when harvest-time drew near, and the Turks imagined that the soldiers must exchange the rifle for the reaping-hook, it was again the women, children, and old men who gathered in the crops.

The financial condition of Bulgaria leaves much to be desired. In public as in private life economy is the characteristic trait of the people, and the Court of Accounts not only scrutinises every sum actually spent, but also has the right to veto every order to pay. The weight of the public debt was greatly increased by the wars of 1912-18. Bulgaria's financial system hinges on the National Bank, which is bereft of independence by the state. This institution accepts deposits from public departments and private persons; advances loans secured by mortgages to communes, state institutions, and individuals, or on security of bills, goods, and bills of lading; discounts Treasury bonds and commercial bills; receives the state revenues, and pays out sums on behalf of the government to the extent of these revenues. It also opens credit accounts to officials who are not always solvent and to the state without limit or real guarantee. All the funds of the savings banks are deposited in the National Bank, which issues notes up to a sum that must not exceed the triple of its capital and reserve fund. But as the coffers of the bank are filled with paper, a run on it would prove fatal to it; and yet, although this is well known throughout the country, public confidence is still unshaken. But as this confidence cannot be communicated to foreign creditors, the premium on gold, which the National Bank never gives in exchange for its notes, is considerable and increasing.

In consequence of the universality and distribution of land, pauperism is unknown in

Bulgaria. Everybody is poor; nobody is in want. Extreme thrift is practised in the household, the only exception being expenses incurred for the education of children. Here the Bulgarian paterfamilias is not only generous with his savings, but he sometimes actually borrows. Education was made obligatory and gratuitous by the Constitution. Every commune must support a public school, either alone or conjointly with the adjacent villages. The municipality provides and repairs the building, while the state pays the staff. Bulgaria possesses about one educational institution to 880 inhabitants. Manual, and especially agricultural, labour is carefully taught in the primary schools. A number of colleges and intermediate schools prepare candidates for the university, the seat of which is Sofia. In Bulgaria, as in most Balkan countries, the number of university graduates is disproportionately great, and their influence on the tone of public life is lowering. The state leaves too little to private initiative.

Professional politicians, whose ranks are recruited from the unemployed of the liberal professions, are the real scourge of the country. Parliamentary parties rally round leaders instead of allowing principles to form their lines of cleavage. Once a party has quitted office, all its acts are closely scanned by its successors with a view to impeaching the ex-ministers, the crime alleged being generally corruption; and this paralyses effort and checks initiative. To these disputes the bulk of the nation is indifferent; but the sovereign utilises them for the maintenance and extension of his royal prerogative and personal influence. And to-day the king is the source of all power. He occupies in Bulgaria a position analogous to that of Wilhelm II. in Prussia. Thus it is not a parliamentary majority but the king who dismisses every cabinet and chooses the party and the ministers who shall succeed it in office. An administration with an overpowering and compact majority in the *Sobranie* may be suddenly dismissed and a group with hardly a dozen parliamentary representatives called to power. And the electors invariably return the partisans of the minister who has responded to the monarch's call. The name constitutional applied to such a régime is a misnomer. The chief of the state generally adjusts these sudden moves to the exigencies of his foreign policy, the aim of which was so to steer his course between Russia and her Teutonic rivals as to harvest in the maximum of profit from each without binding himself irrevocably to either. But after the proclamation of Bulgaria's independence he uniformly followed the lead of the Central European powers, while relying on Russia's generosity should the experiment lead to disaster. Austria's aim was to help Ferdinand to create a great Bulgarian tsardom, extending if possible from the Golden Horn to the Adriatic, and thus permanently to paralyse the Serbian peoples. It was this perspective that moved King Ferdinand to make war upon his own allies, the Greeks and Serbs, in 1913; and it was this hope that determined the Bulgarian people, irritated though they were by the calamity which followed, to curb their wrath against the king, who persuaded his ministers that Austria would come to the rescue and repair the sinister consequences of his miscalculations. In 1915 Ferdinand again interposed against the Serbs.

The Bulgarians, commonly classed as Slavs, are in reality a composite people, the predominant ethnic element having been supplied by Finno-Ugrian hordes from the Volga, whence the name *Volgar* or *Bolgar*. Arriving in the Balkan Peninsula in the 7th century, they found the country inhabited by an Indo-European people, the Thracian Illyrians, who had settled there about 1700 B.C. Incurable in-

dividualists and devoid of the social sense, the Thracians were incapable of organising a stable empire, and endless internal discord rendered them an easy prey to the Slavs, who invaded the country in the 3d century. Anaëthical by temperament, the Slavs, who had attained a much higher degree of culture than the Bulgar invaders, whose rigorous military discipline was maintained in peace, were soon conquered by these. But, like the Normans in England, the Bulgars in the Balkans assimilated the culture and adopted the language of the Slavs, which has since stood them in good stead. But the national character has undergone no sensible change despite the large admixture of foreign elements—Greek, Kutzovalach, Albanian, Gypsy, Armenian, and Jewish—which has taken place during the centuries which have elapsed since then. On the language, too, these ethnic accretions have hardly left a mark.

The Bulgarians are the Spartans of contemporary Europe. Black bread, garlic, paprika, maize, cheese made of sheep's milk, and sour milk are the staple food of the peasant, whose physical condition leaves nothing to be desired. The Bulgarian soldier can stand the fatigue and privations of a campaign better than any other in Europe, except, perhaps, the Russian. The birth-rate is very high, and families of ten and twelve children are not uncommon. The number of illegitimate children is but 4 per cent. in the country and 11 in the town. Even after their marriage, the sons often remain in their father's house, and continue to work in common. Marriage is as much an economic venture—the wife reinforcing the band of workers—as a matter of sentiment. Thrift carried to excess is one of the traits of the Bulgar, and its corollary is an isolated existence, involving few social duties and entailing no needless expense. To make money is the chief care of the average man and woman, and there is no more skilful bargain-driver than the Bulgar. And as the struggle for existence is severe, the artistic sense of the nation has never been developed. Religion is a rite among this austere people, and patriotism a cult. The Bulgarian worships his country, and accounts no sacrifice too great for its welfare. The least criticism of the national character or customs is taken to heart as a personal affront.

Under the constitution of 1879, amended in 1893 and 1911, the legislative authority is the *Sobranie*, a single chamber elected by direct general vote for four years, unless dissolved sooner by the king. For changes of constitution, or succession to the throne, acquisition or cession of territory, a Great *Sobranie* of double strength of numbers is elected.

History.—Bulgarian history before Christianity was introduced into the country is interwoven with that of Byzance. The pagan Bulgars constantly invaded the territory of the Greek emperors, by whom they were sometimes defeated and sometimes bought off. Koo-brat, chief of the Volga Bulgars, having united the Dacians with his own people, was the first who endeavoured to establish an organised state. The Emperor Heraclius treated him as an equal, and obtained his alliance in return for honours and gold (601–641 A.D.). But his five sons undid what their father had achieved, and plunged their people in anarchy. Koo-brat's capital was situated in what is now a village of the Russian province of Kazan, where the ruins of his ramparts are still visible. After many encounters with Russians, Franks, and Byzantines, under Asparoukh and other chiefs, the Bulgars under Terbel, a great military leader, a wise law-giver, an unscrupulous and cruel ruler, saved Constantinople from the hands of the Saracens. Another man of mark was Kroum (802–815), who took Sofia and Adrianople, strengthened the monarchical

power, rendering it hereditary instead of elective, gave severe laws, and offered human sacrifices to the gods.

Prince Boris, one of the greatest of Bulgaria's rulers, embraced Christianity (865) in order to gain access for his subjects to the source of civilisation and progress, and fifteen years later the Bulgarian Church was declared to be subject to Byzance. His successor, Simeon, abandoning the career of a monk, waged successful wars against Byzance, forced the emperor to pay him tribute, and finally proclaimed himself autocrat of all the Bulgars and Greeks (921). His empire extended from the Black Sea over Thrace, including Adrianople, Macedonia, Albania, and Epirus to the Gulf of Arta, and along the Adriatic seaboard. Prishtina and Belgrade were among his possessions. Under Peter I. the Petchenegs of Russia invaded Bulgarian territory, and dealt the first blow to the empire. The spread of the sect of the Bogomils intensified domestic strife, and in 963 the realm split into two halves, the eastern and western. The battle of Belacitsa (1014), in which 15,000 Bulgarian prisoners had their eyes gouged out by Basil II., known as 'the slayer of Bulgars,' gave the death-blow to the realm, which was incorporated in Byzance. Later on a successful revolution, under Assen (1186), culminated in the proclamation of Bulgarian independence, which was firmly established two years later with the help of the Serbs. With the extinction of the Assenide dynasty in 1258 the Serbian element became preponderant, and finally the loss of Sofia (1382) to the Turks, and the defeat of the allied Serbian and Bulgarian troops by Murad at Kossovo (1389), put an end to the independence of Bulgaria. It was not until the 19th century that the people, at first with Russia's encouragement, and then with her active assistance, awakened to new life. Since then it may be fairly said that Bulgaria owes much of what she has, and is, to her Russian liberators and protectors. The beginning of a national awakening dates from the year 1762, when the monk Paysios, then at Mount Athos, wrote the national chronicles, and revived memories of ancient glory. A new national literature began; the first Bulgarian school was opened in 1835, and was followed by others. A newspaper appeared in 1844. The Crimean war stirred up Slavonic sympathies which Russia had sedulously and naturally cherished. In 1872 the Bulgarian Church and archbishop became again independent of the hated supremacy of the Greek patriarch.

During the troubles in Bosnia and Herzegovina in 1875 excitement in Bulgaria began, but two or three ill-organised local risings in 1876 were swiftly suppressed by Turkish troops. The unconcealed aspirations of the Christians provoked the suspicions and fears of the Moslems, and the Turkish inhabitants of Bulgaria rose against their unarmed Christian neighbours, assisted by the notorious Bashi-Bazouks, or irregular troops. In the provinces of Philippopolis and Trnova fifty-eight villages had by June 1876 been destroyed, and twelve thousand men, women, and children cruelly slain. The 'Bulgarian atrocities' awakened horror throughout Europe, especially in England; and a conference at Constantinople proposed to the Porte the organisation of two autonomous provinces. The Porte refused to make concessions. Russia, in its assumed capacity as guardian of the Slav peoples of Turkey, declared war (1877). By the treaty of San Stefano, the victorious Russians (March 1878) proposed to constitute a Bulgarian state within the limits of the old kingdom, extending from the Danube across Macedonia to the Aegean. But the dissatisfaction of Austria and Britain with the proposed arrangement led to the Berlin Congress; and the Berlin treaty (13th July

1878) constituted an autonomous, though tributary, Bulgaria north of the Balkans, whilst to the mainly Bulgarian province south of them, that of Eastern Rumelia, it granted administrative autonomy. The prince of Bulgaria, freely elected by the people, was to be confirmed by the Porte with the assent of the Powers. The first choice of the Bulgarians was Prince Alexander of Battenberg, a cousin of the Grand-duke of Hesse (1879). In 1885 the outbreak of a revolution in Eastern Rumelia, and Prince Alexander's acceptance of its union with Bulgaria, provoked the jealousy of Serbia; Milan invaded Bulgaria; and in the fourteen days' war which ensued the Bulgarians suffered temporary defeat, till, at Slivnitsa, Prince Alexander turned the tide of fortune, entered Serbian territory at the head of 50,000 men, and captured Pirot. The Sultan recognised the *fact accompli*, and the Powers thereafter treated Bulgaria and Eastern Rumelia as one country. The prince, who ere long fell into disfavour with Russia, was in 1886 kidnapped by Russian partisans and carried into Russia; and though he returned, he felt himself compelled to abdicate owing to Russian hostility. In 1887 Prince Ferdinand of Saxe-Coburg, against the will of the great Powers (especially of Russia), accepted the throne, but was fully recognised only after the death of Stambolov (q.v.) in 1895 had rendered possible a renewal of cordial relations with Russia. Great part of the interior of Macedonia is occupied by Bulgarians, and the troubles in Macedonia were due as much perhaps to the religious rivalry (see GREEK CHURCH) and race-hatred of Bulgarians and Greeks as to the oppression of the Turks. The free Bulgarians strongly sympathised with their kinsfolk under Turkish sway. Soon after the constitutional revolution in Turkey in 1908 the Bulgarian nation declared itself independent of Turkish suzerainty, and its prince named himself a Tsar. Sinking their differences for a moment, Bulgaria, Greece, and the two Serb kingdoms in 1912-13 made war on Turkey (q.v.); but in 1913 Bulgaria, isolated against her former allies as well as Turkey and Rumania, had to yield a great part of her share of conquered Turkey, and cede the north-east corner of her old territory to Rumania. Nevertheless she came out of the two wars with considerably increased area, and an Aegean seaboard. Bulgaria entered the Great War (q.v.) in 1915 upon the side of the Central Powers, whose successes seemed to offer an opportunity of repairing her losses. She surrendered in 1918, and in 1919 by the treaty of Neuilly submitted to disarmament and loss of territory to Yugoslavia and Greece. Ferdinand abdicated in favour of his son, Boris III.; and soon after Mr Stamboliiski, the Agrarian leader who had been in prison throughout the war for his opposition to the king's policy, became prime-minister. Compulsory labour for the state was enacted, the larger estates distributed among peasants, and the Radoslavov ministry was impeached for entering the war. The failure of the Sèvres settlement reopened the question of Thrace. Mr Stamboliiski was assassinated in the revolution of 1923.

Language and Literature.—The original Bulgarian was of course an Ural-Altaic or Ugrian language, but it has left only a few traces in the Slavonic speech adopted by the Bulgarians who settled in the Balkan Peninsula. The old Bulgarian Slavonic tongue is closely allied to the Great Russian, but some Serbian, Greek, Romanic, Albanian, and Turkish elements have found their way into the language. The literature in the old palmy days consisted chiefly of translations from the Greek, and theological works. The modern literature (since 1762) is chiefly educational and

popular and political. The poems of Slaviikov, the novels of Karavelov, the historical works of Drinov, deserve mention. Ivan Vazov (1850-1921) was the most notable of Bulgarian writers, not only for his lyric and epic poems, but for his novels and short stories. *Under the Yoke* was translated by Edmund Gosse. There is also a rich lyrical popular poetry. The Cyrillic alphabet (shorn of three letters by the government in 1921) is that ordinarily used, as in Russian—namely, that modified out of the Greek by Cyril (q.v.).

See A. Xenopol, *L'Histoire des Roumains de la Dacie Trajane*; G. Schlumberger, *L'Épopée Byzantine; Bulgarie de To-day* (Bulgarian Ministry of Commerce and Agriculture, London, 1907); R. P. Guérin Sonjeon, *Histoire de la Bulgarie* (Paris, 1914); L. de Launay, *La Bulgarie d'Her et de Demain* (Paris, 1912); *Constitution du Royaume de Bulgarie, votée le 16 Avril 1879, et modifiée le 15 Mars 1893, et le 2 Juillet 1911* (imprimerie de l'État, Sofia, 1911); R. Pelletier, *La Vérité sur la Bulgarie* (Paris, 1913); L. Payacoff, *Les Finances de l'État Bulgare et M. Sallabacheff* (imprimerie de la Cour, Sofia, 1909); G. Bousquet, 'L'Effort Bulgare' (*Revue de Paris*, Feb. 1914); G. Clenton Logio, *Bulgaria: Problems and Politics* (1919).

Bulgaria, a mediæval Finno-Ugrian kingdom on the middle course of the Volga, whence it took its name. The Bulgars in the 7th century A.D. conquered the Balkan country now known as Bulgaria, where they became Slavonised. See the foregoing article, especially the section on *History*. Those who remained behind became Mahomedans. For their history, see KIPCHAKS, KAZAN; and for their capital, BOLDARY.

Bulgarin, FADDÉI VENEDIKTOVICH, Russian author and journalist, born in Minsk in 1789, served in the Russian army, but finding himself neglected, in 1810 joined Napoleon. In 1819 he returned to St Petersburg, where his writings soon attracted notice by their intense satire and intense servility. In 1825 he started the *Ssèvernaja Ptchela* ('Northern Bee'), a daily paper, which for long was alone permitted to discuss political questions. He was a privy-councillor at his death, 13th September 1859. A zealous supporter of reaction and of absolutism, he enjoyed, through relations with the secret police, an unlimited power, which he freely used to the detriment of opponents. He was a witty and a versatile writer, and published travels, histories, novels, and statistical works, some of them of value. His *Memoirs* appeared in 6 vols. in 1846-50 (Ger. trans. Jena, 1858-61).

Bulkheads, in a ship, are the partitions between the several portions of the interior, whether to separate it into compartments to suit the exigencies of stowage or loading, or as a safeguard against foundering (see BUOYANCY). Bulkheads are either *transverse*—i.e. running athwart the vessel—or *longitudinal*—i.e. in the direction of the vessel's length—and are usually made watertight, thus dividing the interior of the vessel into three, four, or more compartments, each of which is self-contained, and watertight in reference to its neighbours. Should any one of the compartments, through damage to the skin of the vessel, be laid open to the sea, its self-contained character prevents the water penetrating the other compartments, thus lessening the risk of foundering, if not altogether removing it. In very many of the modern high-class mail and passenger steamships, the hull is subdivided to such an extent that if any two compartments be simultaneously laid open to the sea, the vessel still retains sufficient floating power. The Merchant Shipping Act of 1854 provided for the fitting of a certain number of bulkheads in steamers, but the growth in ship dimensions soon rendered this inelastic provision utterly useless, if not mischievous, and it was

repealed in 1862; Lloyd's Registry virtually assuming the functions which the Board of Trade then resigned. The loss of the *Titanic* in 1912 revived discussion on the Board of Trade's responsibility, and created a widespread demand for both longitudinal and transverse bulkheads in all passenger-ships of a certain size. See SHIPBUILDING.

In sailing-ships the only one usually considered necessary is that nearest the bow, to provide against damage to the bow through collision. In numberless instances the 'collision bulkhead' has saved the vessel which struck another 'bow on.'

The practice of carrying water ballast in the bottom of merchant steamers, to secure the requisite stability when unloaded with cargo, has resulted in various types of double or cellular bottoms. The presence of the inner and watertight bottom in such cases has not infrequently saved the vessel after grounding on rocks.

In iron war-vessels, which have inner bottoms, there may be hundreds of compartments, each of which is watertight as regards its neighbours and provided with a watertight door. In ships with several screws each engine is in a separate compartment (see NAVY).

The word is also used for the roof of a bulk, or for a bulk itself, that is, a stall or projecting framework in front of a shop—familiar in literary biography of the 18th century as the sleeping-place of ill-remunerated authors.

Bull. See CATTLE.

Bull. The word is derived from the Lat. *bullā*, 'a bubble of water,' and then 'a round ball of any kind.' In the middle ages it came to signify the capsule of the seal appended to letters from emperors or popes, next it was used for the seal itself, and lastly for the document to which the seal was appended. Its use is now commonly restricted to papal documents issued with certain indispensable formalities.

These formalities have varied greatly from age to age, and we must content ourselves with an account of the modern practice down to December 1878, and of the changes made at that date by the reigning pontiff Leo XIII. Down to that time, a bull had a seal, usually of lead, occasionally of gold, attached to it. On one side was the official name of the pope (e.g. Gregory XVI., Pius IX.), on the other the heads of Peter and Paul, separated by a cross and surmounted by the letters SPE (i.e. 'Sanctus Petrus') and SPA (i.e. 'Sanctus Paulus') respectively. The seal was fastened by red or yellow silk, or by uncoloured hemp, according to the nature of the contents. Bulls were written on strong parchment and in the Latin tongue. They began with the words 'N. episcopus servus servorum Dei dilecto filio (or dilectis filiis, &c.), salutem et apostolicam benedictionem.' Sometimes in cases where permanent decisions were given or privileges of great moment conferred, the words 'In perpetuum,' or 'In æternam rei memoriam,' were substituted for 'Salutem et apostolicam benedictionem.' Sometimes, also, when no special persons were addressed, 'In perpetuum,' &c., immediately follows the 'Servus servorum Dei.' Usually signatures are added below in testimony that the bull is authentic. Formerly it was common for the cardinals to sign; later on this was done by various members of the curia, specially by the protodotary, secretary of briefs, and vice-chancellor. The bull is dated according to the year of the incarnation, the year of the pontificate, and the day of the month after the old Roman reckoning. The character used from the reign of Adrian VI. to our own day is that of crabbled and indistinct kind known as 'litera S. Petri,' or in Italy as the 'carattere bollatico' or 'teutonico.' Finally,

the bull is expedited from the apostolic chancery in the Vatican.

By a *Motu proprio* of December 9, 1878, Leo XIII. ordained that the leaden seal in use for more than a thousand years should be employed henceforth only in case of bulls concerning collations, erections, and dismemberments of greater benefices (reserved to the pope), and other solemn acts of the holy see. In other bulls, 'especially those relating to ordinary benefices and marriage dispensations, the old leaden seal is to be replaced by a red one stamped on the parchment itself, with the heads of St Peter and St Paul surrounded by the name of the reigning pope. The ordinary Latin current writing is henceforth to displace the Gothic character.

The divisions of bulls into different species—e.g. 'consistoriales,' issued after consultation in consistory; 'dimidia,' by a pope not yet crowned, &c.—possess little general interest. If we add to the words of Leo XIII., just quoted, bulls conveying doctrinal decisions, we have a correct idea of the objects for which bulls are published. It is a mistake to suppose that bulls are always, and of necessity, more important than briefs.

A *Bullarium* is a collection made without official authority of papal documents (not necessarily bulls in the strict sense) which have not found a place in the *Corpus Juris*. A *bullarium* may contain the acts of a particular pope, or may be limited to bulls relating to particular orders, churches, &c., or it may comprise bulls of all ages, and on all kinds of subjects, excluding only those already to be found in the *Corpus Juris*. The first *bullarium* appeared at Rome in 1586, edited by Cherubini. The most convenient is that published at Turin (24 vols. 1857-72).

Bull, a ludicrous blunder in speech implying some obvious absurdity or contradiction. The origin of the name is unknown. It has been sought in the contrast in papal bulls between the humility of the title, by which the pope styles himself 'servant of servants,' and his assumption of absolute supremacy and authority over the world—an unlikely explanation. It is found with much the same sense as early as the 14th century in the *Cursor Mundi*. Bulls in their best form are usually alleged to be an especial prerogative of Irishmen—at least it is certain that the best examples have come from Ireland. Coleridge, remarking on the well-known bull, 'I was a fine child, but they changed me,' says: 'The *bull* consists in the bringing together two incompatible thoughts, with the sensation but without the sense of their connection.' Sydney Smith, whose authority is supreme in this region, says: 'A *bull* is an apparent congruity, and real incongruity of ideas, suddenly discovered.' It is 'the very reverse of wit; for as wit discovers real relations that are not apparent, bulls add apparent relations that are not real.' See the *Essay on Irish Bulls* (1803) by Miss Edgeworth and her father.

Bull, GEORGE, D.D., divine, was born at Wells, Somersetshire, in 1634, and studied at Exeter College, Oxford, whence he retired in 1649, having refused to take the commonwealth oath. Ordained in 1655, he took the small parish of St George's, Bristol, and subsequently obtained the rectory of Siddington, Cirencester (1658), that of Avening, Stroud (1685), the archdeaconry of Llandaff (1686), and the bishopric of St Davids (1705). He died at Brecknock, 17th February 1710. His *Harmonia Apostolica* (1670), whose object was to reconcile the apostles Paul and James on the subject of justification, occasioned considerable controversy among divines, and, in answer, Bull published his *Examen Censuræ* and *Apologia pro Harmonia*. His greatest work, the *Defensio Fidei Nicenæ* (1685), was directed against

Arians and Socinians, Tritheists and Sabellians; for his *Judicium Ecclesie Catholice* (1694) the thanks of the whole French clergy were sent to him through the celebrated Bossuet. These are included in Dr Burton's edition of his works (8 vols. Oxford, 1827), to which is prefixed a Life by R. Nelson; and they are translated in the *Library of Anglo-Catholic Theology* (Oxford, 1842-55).

Bull, JOHN, a generic name for an Englishman as a personification of what is supposed to be the English type, from Arbuthnot's use of the name in his *History of John Bull* (1712; reprinted complete in Pope's 'Miscellanies' in 1728). The subject of that history is the 'Spanish Succession during the reigns of Queen Anne and Louis XIV.' Queen Anne is 'Mrs Bull'; 'John Bull's mother' is the Church of England; and 'John Bull's sister Peg' is the Scotch nation, represented as in love with Jack (*Calvin*). The description of Bull is so close to the familiar figure in the pages of *Punch* that a sentence or two must be quoted: 'Bull in the main was an honest plain-dealing fellow, choleric, bold, and of a very inconstant temper. He dreaded not old Lewis (Louis XIV.), either at back-sword, single falchion, or cudgel-play; but then he was very apt to quarrel with his best friends, especially if they pretended to govern him. If you flattered him, you might lead him as a child.'

Bull, JOHN, musician, born in Somersetshire about 1563, was appointed organist in the Queen's Chapel in 1591, first music lecturer at Gresham College in 1596, and organist to James I. in 1607. A Catholic, he fled beyond seas in 1613, and at Brussels entered the archduke's service; in 1617 he became organist of Antwerp Cathedral, and there he died, 12th March 1628. Little of his music has been printed. The claim advanced for him to the authorship of 'God save the King' (see NATIONAL HYMNS) is better founded than the impossible story of his adding, within a few hours, forty parts to a composition already written in forty parts; but from the extreme difficulty of his instrumental music, it would appear that his great reputation as an organist was deserved.

Bull, OLE BORNEMANN, a famous violinist, was born 5th February 1810, at Bergen, in Norway. His father's opposition only deepened his natural passion for music. In 1829 he went to study under Spohr at Cassel, but was so coldly received that he betook himself to Göttingen to study law. But music soon asserted its mastery over him, and an acquaintance with Paganini gave him the impulse that he needed. He accompanied his master to Paris, but here his fortune sunk so low that he thought of drowning himself in the Seine. The patronage of a lady of rank saved him, and soon he rose to fame as a violinist. His style of playing was in some respects like that of Paganini. He was received in Italy with prodigious enthusiasm, and after visiting England, Scotland, and Ireland, he made a tour of triumph through Russia, Germany, and Norway. In 1843-45, in 1852-57, in 1867-72, and other years he conducted a series of musical tours in America, where he made enormous sums by his concerts, much of which he lost by unfortunate land speculations, especially an attempt to found a colony of Scandinavians in Pennsylvania. This turned out a complete fiasco, and once more Bull had to take to his violin. He afterwards paid a third visit to the United States, but returned to end his days in Europe. He died at his villa near Bergen, 17th August 1890. If it is not true that he was half charlatan, half genius, it may be said with truth that he was quite as much a bizarre virtuoso as a great artist. His compositions have had but little reputation apart from his own playing. See the *Memoir* by Sara C. Bull (1886).

Bulla, or BUBBLE-SHELL, a genus of Gasteropod Molluscs, formerly somewhat ambiguous, but now defined as one of the Tectibranchs or 'snails' with

Bulla aperta.

concealed posterior gills. In the family (Bullidæ) to which the bubble-shell belongs, the shell is thin, often almost globular, with concealed spire and wide aperture. It serves to protect the gills, and less frequently the entire animal. In some cases it is quite covered by the mantle and foot lobes. In the closely allied Haminea, the shell is horny and elastic; in the Sea-hares (*Aplysia*) it is very rudimentary; in some of the likewise nearly related Philinidæ it is entirely absent. The Bullidæ are carnivorous, and limy plates in the gizzard aid in internal mastication. There are numerous fossil and living species, all marine, and some British. See GASTEROPODS.

Bulla, a metallic seal. See BULL, and SEAL.

Bullace (*Prunus insititia*), a shrub or small tree, larger and much less spiny than the sloe, but very closely allied to it, as it is also to the plum, so that many botanists regard them all as one species (see PLUM). The fruit is larger than the sloe, generally globose, and although it partakes in some degree both of the acidity and the roughness of the sloe, it is not unpleasant, especially after having been mellowed by frosts, and makes excellent pies or tarts. 'A bullace-pie is a standing dish at the harvest-home supper in the south of England, only it requireth rather more sugar than the housewife is always willing to allow.' The bullace is common in hedges, coppices, and banks in England, and in many parts of Europe, and is sparingly naturalised in the United States.

Bullace-plum, the Jamaican name of the pleasant fruits of *Melicocca bijuga*, a sapindaceous tree introduced from Guiana and New Granada.

Bullæ, or BLEBS, are collections of serous fluid of considerable size, situated immediately beneath the cuticle, and raising it from the true skin. They differ from vesicles only in size; and no very definite line can be drawn between a large vesicle and a small bulla. They usually vary in diameter from a quarter of an inch to two inches. The most familiar examples are the 'blisters' produced on the hands by rowing, or the feet by walking. They are met with occasionally in many diseases of the skin—e.g. eczema, erysipelas, urticaria, scabies, &c.; but in pemphigus and in some forms of hydroa they constitute the chief feature of the disease.

Bull-baiting, a barbarous sport, once very popular in England, and in which all classes of society delighted equally. A number of dogs were set on to attack a bull; and in order that he might be made as furious as possible, his nose was sometimes blown full of beaten pepper before he was turned loose. Another form of the sport was to fasten the bull to a stake, by a rope of some yards' length, and to set bulldogs on him, one at a time, which were trained to seize him by the nose—which, when accomplished, was called *pinning* the bull. But no small part of the enjoyment of the spectators was derived from the success with which the attacks of the dogs were met by the bull lowering his head to the ground, and receiving them on his horns, often tossing them to a great distance. King James I. greatly delighted in this sport; and when the Tsar Nicholas I. of Russia visited England, before his accession to the empire, a boxing-match and a bull-baiting were got up to show him English tastes. Bull-baiting was declared illegal in 1835.

An equally barbarous sport, termed *Bull-running*, was formerly practised at Stamford and Tutbury, where men and women took the place of dogs, maddened the bull with hideous noise, and then pursued it with 'bull-clubs,' till the wretched brute sank under the blows of its assailants.

Bulldog, a breed which is regarded as peculiar to England, the only country in which it has been kept pure. The bulldog disputes with the greyhound the honour of being the oldest known dog. The general appearance of the bulldog is that of a smooth-coated, compact dog, low in stature, but broad and powerful, with a massive head, large in proportion to its body, which is short and well knit. The bulldog should convey an impression of determination and strength, without unwieldiness. The following are its principal points: Head as large as possible, measuring over 20 inches in circumference in first-rate specimens;

Bulldog.

forehead flat, with the skin much wrinkled, with a groove or indentation called the 'stop' running up between the eyes; ears small and thin, folding over at the back, showing the inside; eyes round, black, and not bloodshot; the face very short, the nose being set almost between the eyes, allowing the dog to breathe while pinned on to the bull in the old days of bull-baiting; upper lip joining the lower, quite covering the teeth, which should not project; shoulders sloping back and muscular; body well ribbed up, with the belly tucked up; back short, narrow at the loins, the spine rising from the shoulders to the loins, and curving to the tail, forming an arch, a characteristic of the breed termed 'roach-back'; the tail short and smooth, with a slight twist which prevents it being raised high—an abortive or 'sciew-tail,' though common, is not a good point; forelegs straight-boned, but carried wide apart, presenting a bowed appearance; action, a peculiar roll, the body swinging between the forelegs; colour, bindle, white, or fawn; weight about 50 lb. The bulldog was extensively used for Bull-baiting (q.v.), whence he derives his name. After the abolition of this pastime he fell into discredit, till his qualities as a devoted and faithful companion gradually restored his popularity. The bulldog shares with the gamecock the distinction of being the most fearless of animals, but in disposition is so lazy that he is slow to take offence, though he will fight to the death if attacked.

The BULL-TERRIER was originally a cross between the bulldog and the terrier, but is now a distinct breed. He combines the courage of the bulldog with the activity of the terrier; his quickness and sagacity make him a good companion,

fearless, of combative powers, but not necessarily quarrelsome; head long, muzzle of great strength, body lightly ribbed but powerful, colour white.

Bullen, ANNE. See **BOLEYN**.

Bullen, ARTHUR HENRY (1857-1920), prepared a series of scholarly reprints (15th Century Carols, 1884; Elizabethan Lyrics, 1886-91); edited Marlowe, Middleton, and other Elizabethan dramatists, and Thomas Campion; and founded the Shakespeare Head Press at Stratford-on-Avon.

Bullen, FRANK THOMAS (1857-1915), till 1883 a sailor, made notable additions to the literature of the sea—*The Cruise of the Cachalot* (1898), *The Log of a Sea Waif*, *Deep Sea Plunderings*, *A Whaleman's Wife*, *Told in the Dog Watches* (1910).

Buller, CHARLES, born in Calcutta in 1806, was educated partly at Harrow and at Cambridge, but during 1822-24 was Carlyle's pupil at Edinburgh. He was called to the English bar in 1831, and entering parliament as a philosophical Radical before the Reform Bill, continued a member till his untimely death, 29th November 1848. He accompanied the Earl of Durham (q.v.) to Canada as his secretary, and was credited (erroneously according to Sir C. P. Lucas in his edition, 1912) with the main share in writing the Governor-general's famous report on Canadian constitutional reforms.

Buller, SIR REDVERS HENRY (1839-1908), general, entered the army in 1858. He served in China (1860), the Red River expedition (1870), the Ashanti (1874) and Kaffir (1878) wars, and the Zulu war (1878-79, where he won the V.C.), and the Egyptian war. In 1898 he had the chief command at Aldershot, and was sent to South Africa as commander-in-chief in 1899, but on the arrival of Lord Roberts he assumed the divisional command in Natal, where, after very severe fighting, he succeeded in raising the siege of Ladysmith. He returned home in 1900, and in 1901 was reappointed to his former command at Aldershot, but owing to an indiscreet speech in answer to criticisms on his conduct during the war, he was retired on half-pay in October 1901. See *Life* by C. H. Melville (1923).

Bullet is the leaden projectile discharged from any kind of small-arm. Formerly all bullets were spherical, and cast in moulds. Now all rifle-bullets are elongated, and cut by machinery from rods of lead. Robins's and Beaufoy's bullets were egg-shaped; Greener's, Norton's, Delvigne's, and others were of various shapes, with a plug, which, driven

This expanding or dilating action has been claimed by many inventors; but the government in 1857 awarded Mr Greener £1000, as the person who had practically solved the difficulty as far back as 1836. Its effect is to communicate a twist to the bullet, thus steadying it, and causing it to travel point first. This enables a heavier, because longer, projectile to be fired with accuracy from a smaller bore than was formerly used; thereby presenting less surface to the resistance of the air, and so increasing the range.

The Prussian needle-gun bullet did not touch the grooves; the *sabot* took them and communicated the twist to the bullet. The shoulders of the Chassepôt bullet and the slight taper in the Martini-Henry were for the same purpose. Hollow-headed explosive bullets are only used for shooting big game. Their use in war is forbidden by the Convention of Geneva.

The bullet of the Lee-Metford rifle (see **RIFLE**), which consists of a lead core covered with a nickel casing, weighs only 215 grains, as compared with the 380 grains of the Enfield-Martini of 1888. The *dum-dum* bullet was devised and made by the Indian military authorities in their arsenals at Dum-dum, near Calcutta, and is similar to the ordinary Lee-Metford bullet, with the point flattened and the lead exposed instead of being covered by the nickel casing. This caused it to expand when it struck, and made it much more effective than the original bullet. The soldiers in the Indian frontier wars filed off the points of the bullets themselves in imitation of the *dum-dum*. A Lee-Metford bullet (Mark IV.), with a hollow in the front end, intended to have the same 'stopping' property as the *dum-dum*, was issued for service in the British army in 1899; it is essentially the rifle-bullet of to-day. See the subject more fully treated in its connection with the weapon at **RIFLES**; also the articles **CANNON**, **CARTRIDGE**, **SHOT**, **SHELL**, and **MACHINE-GUNS**.

Bullet-tree, or **BULLY-TREE** (*Mimusops balata*), a sapotaceous tree found in Guiana, and valued for its wood, which is solid, heavy, close-grained, and durable, and also for its delicious cherry-like fruit. It yields balata-gum, a substitute for gutta-percha (see **BALATA**). The name is somewhat vaguely shared with other fruit-bearing trees. Thus *Bumelia retusa* is the Bastard Bully-tree, and *B. insignis* the Black Bully-tree, while *Lucuma mammosa*, of which the fruit is called the marmalade, is sometimes called Jamaica Bully-tree.

Bull-fights may have been practised by the Minoan Cretans. At all events they left many artistic representations of young men and girls leaping over bulls. See **MINOTAUR**. Combats of men with bulls for the entertainment of the public were common in Greece, particularly in Thessaly, and in Rome under the emperors, though in later times they were forbidden both by emperors and popes. They are still a favourite spectacle in Spain and Mexico, where, indeed, the *corrida de toros* is the national pastime. In Spain they were abolished by Charles IV.; but Joseph, Napoleon's brother, re-established them out of policy, the mass of the Spanish population being passionately fond of the sport. The most magnificent bull-fights were at one time instituted by the monarchs themselves; at present, in Spain, they are held either as private speculations or for the benefit of public institutions. So also in the city of Mexico. In Madrid the bull-fighting season commences in April and lasts until November. During that time there is at least one Sunday or Saint's-day afternoon in every week devoted to the sport. The proceeds go to the funds of the public hospital. The

TYPES OF RIFLE-BULLETS.

into the lead by the force of the explosion, caused it to expand and take the grooves in the barrel.

fight take place in a kind of circus, called the *Plaza de Toros*, round which the seats rise one above another, like the steps of a stair, with a tier of boxes over them. The *Plaza* is capable of containing from 10,000 to 15,000 people, who pay a high price of admission, considering the rate of wages in Spain; and all go attired in their best to the spectacle. The Castilian bulls, usually chosen for fight in Madrid, are fiercer and more active, but inferior in strength to British animals. The horses engaged in the conflicts are worthless brutes, fit only for the knacker. The men employed in the fight are generally those who have been bred to it as a profession; but occasionally amateurs may take part in it.

The bull-fight has been described as a tragedy in three acts. The principal performers in the first are the *picadores*; in the second, the *chulos* are the only actors; the third and last act devolves solely on the *espada*. The *picadores* are all mounted, dressed like Spanish knights of the olden time, and armed with a lance; they take up their position in the middle of the circus, opposite the bull-stalls. The *chulos*, who are on foot, are gay with ribbons, and wear very bright-coloured cloaks; they distribute themselves in the space between the barriers. The *espada* or swordsman is also on foot. He is handsomely dressed, and holds in the right hand a naked sword, in the left the *muleta*, a small stick, with a piece of scarlet-coloured silk attached. On a sign given by the president of the sport, a bull is let out from the stalls; the *picadores* stand ready in the arena waiting his charge. With a brave bull, they find all their skill requisite in acting on the defensive; with a cowardly one, they act on the offensive; and should their stabs be ineffectual in rousing the animal to the requisite fury, the poor beast is hooted by the crowd, and ultimately stabbed ingloriously in the spine. Whenever a horse is wounded, the rider betakes himself to flight; and when either the above casualty happens, or a *picador* is thrown, the *chulos* rush in, and attract the bull by their cloaks, saving themselves, if need be, by leaping over the barrier which incloses the circus. At the same time, another *picador* calls off the bull's attention to himself by shouting. When the bull begins to flag, the *picadores* are succeeded by the *chulos*, who bring with them the *banderillas*—i.e. barbed darts about two feet long, ornamented with coloured paper-flags, which they stick into the neck of the animal. Sometimes these darts have crackers attached to them, the explosion of which makes the bull furious. The *espada* now enters alone to complete the tragic business. As soon as the bull's eye catches the *muleta*, he generally rushes blindly at it; and then the *espada*, if well skilled, dexterously plunges the sword between the shoulder-blade and spine, up to the very hilt, and the animal drops dead at his feet. A splendid team of mules then enter, glittering with flags and tinkling with bells, who drag off the slain at a gallop. The victorious *espada* is greeted with acclamations, and not less so the bull, should he wound or even kill his antagonist, in which case another *espada* steps forth into the arena; but human life is rarely sacrificed. From six to ten bulls are usually despatched in a single day, twenty minutes being about the time usually taken to slay one.

Every large town in Spain possesses a *Plaza de Toros*, and so do many towns in Spanish America; those of Madrid, Seville, and Cáceres are especially handsome. Bull-fighters personally are esteemed much as prize-fighters are in England; but they are the idols of the lower classes, from whose ranks they are drawn. Formerly those who were killed on the spot, and died without confession, were denied burial rites; but a clergyman

is now in attendance with the consecrated host, in case of accident.

Bull-fighting is not unknown in the south of France.

Bullfinch (*Pyrrhula rubricilla* or *vulgaris*), a bird of the great Finch (q.v.) family *Fringillidae*, a little larger than the common linnet, and of a genus closely allied to the grosbeaks and crossbills. The genus is particularly characterised by the short, thick, rounded bill, of which the sides are inflated and bulging, and the tip of the upper jaw overhangs that of the lower one. The plumage is very soft and dense. The crown of the head, the long wing-feathers, and the tail are shining black. The back of the male is ashy gray, that of the female brownish gray. The under surface of the male is a bright tile-red, that of the female bluish gray. There is a conspicuous white bar across the wing. The tail of the bullfinch is almost even.

Bullfinch.

This bird is not unfrequent in England, Ireland, and the south of Scotland; and is found in most parts of Europe, from the south of Norway to the Mediterranean, extending eastward throughout Asia, even to Japan. It frequents woods and gardens, and builds its nest in trees or bushes a few feet from the ground. The nest is loose, made of dry twigs and fibrous roots. The eggs are four in number, bluish or purplish white, spotted and streaked with purplish gray and reddish brown. It feeds chiefly on seeds and berries in winter, and in spring is excessively destructive to the buds of fruit-trees in those localities in which it is abundant, selecting the flower-buds, and apparently finding them the most palatable of all food. Selby says: 'I have known a pair of these birds to strip a considerable sized plum-tree of every bud in the space of two days.' On this account gardeners are sometimes compelled to wage war against the bullfinch. He is also deliberately adjudged to be the farmer's enemy by impartial judges (see Wood's *Farmer's Friends and Poes*, 1888).

The song of this bird, in a wild state, is very simple, but it is remarkably susceptible of improvement by education. Some trained bullfinches can whistle an air very accurately, and with a power and variety of intonation far exceeding their natural song. The ability to whistle several airs well is rare. The training of these birds is a work both of time and trouble: it is chiefly carried on in Germany. Not less than nine months of training are requisite: it begins when the bird is a mere nestling, and must be carefully continued till after the first moulting; for it is a curious circumstance, that all which has been previously acquired is very apt to be lost at that time.

The bullfinch is capable of strong attachment to those who feed and caress it, and often becomes so domesticated as to show no desire for liberty (see CAGE-BIRDS). Curious variations of plumage are sometimes observed. The canary is closely allied.

Bullfinch, a goldfield in the Yilgarn district of Western Australia, 23 miles NNE. of Southern Cross on the line between Perth and Coolgardie. The finds in 1910 marked it as exceptionally rich; a boom set in at once, and a city of tents soon accommodated thousands of miners.

Bull-frog (*Rana mugiens*), a species of Frog (q.v.) found in most parts of the United States and Canada, but chiefly abundant in the southern states. It is of a large size, 8 to 12 inches long. The colour is olive green or reddish brown, with large brown or black spots, and with a yellow line along the back. The under surface is yellowish. It receives its name from the remarkable loudness of its voice, heard as a hollow bass in the frog concerts which take place in the evening and all night long in marshy places in America. Its voice can be distinctly heard at a distance of forty or fifty yards. It sits for hours during the day, basking in the sun, near the margin of a stream, into which it plunges with a great leap on the least appearance of danger. It does not confine itself to insects and worms like smaller frogs, but eats fish and other frogs, and is said to be partial to young ducks, and to swallow them entire. Audubon says 'its flesh is tender, white, and affords excellent eating,' the hind-legs, however, being the only part used. He adds that these parts make excellent bait for the larger cat-fish, and that he generally used the gun for procuring bull-frogs, loading with very small shot.

Bullhead, or MILLER'S THUMB (*Cottus gobio*), a small fish in the Acanthopterygii subdivision, abundant in clear rivers and streams, in some parts of the British Islands, throughout the greater part of Europe, and in the north of Asia. It seldom exceeds 3 or 4 inches in length. The colour varies somewhat with the activity of the fish, but is brown on the upper parts, and white beneath.

Bullhead.

The fins are rather large, prettily spotted, and with rays slightly produced into spines. The general appearance is not unlike that of the Gurnard (q.v.). The smoothness of the slippery skin, and the quaint depressed head, have suggested its names, that of miller's thumb referring to the flatness caused by the miller's perpetually rubbing flour between finger and thumb. The bullhead eats all sorts of little animals and the spawn of rival genera. Its own is buried in a hole, which the female makes with her tail, and over the cradle the male watches. Its flesh is delicate, and, when boiled, is reddish, like that of the salmon.—The other British species of the genus *Cottus* (q.v.) are marine. The Sea-scorpion (*C. scorpio*), or Father Lasher (q.v.), is a common form which sometimes ascends rivers. The name bull-head is not usually given to any of them. A

sea-fish of a nearly allied genus (*Aspidophorus*) is sometimes called the Armed Bullhead; it is also known as the Pogge (q.v.).

Bullinger, HEINRICH, a Swiss Reformer, was born at Bremgarten, in the canton of Aargau, July 18, 1504. The son of a priest, who later embraced the reformed doctrine and married the mother of his five sons, he became acquainted with the writings of Luther during his studies at Cologne; next he attended the theological expositions of Zwingli at Kappel, and accompanied his master to the religious conference held at Bein in 1528, which resulted in the reformation of the canton. In 1529 he married a former nun, and two years later became pastor of the principal church at Zurich, and Zwingli's successor as leader of the reformed party in its struggle with the Catholics, as well as with the Zealots and the Lutherans. He took a principal part in drawing up the first Helvetic Confession, at Basel in 1536, and aided by his counsel the struggling church both in France and England. He died September 17, 1575. Part of the story of his Life he wrote himself in his *Diarium*. His history of the Reformation was edited by Hottinger and Vogel (3 vols. 1838-40). See the Lives by Pestalozzi (1858) and Christoffel (1875).

Bullion usually means uncoined gold and silver in bars or other masses, though occasionally it is used as practically synonymous with the precious metals, coined and uncoined. The origin of the word bullion in its present sense, as well as that of the French *Billon* (q.v.), and the corresponding Spanish *vellon*, seems to be as follows: Bullion originally meant the mint, where the alloy for the coinage was prepared and the coin stamped (either from the Lat. *bullia*, a round boss or stud, or stamp; or from the verb *bullare*, to boil or bubble); and hence it came in England to signify the standard metal of which the coins are made. In France, where the kings debased the currency much more than ever took place in England, *bullon*, the mint, came to signify the base mixture issued therefrom.

It is difficult to obtain trustworthy statistics regarding the production and consumption of the precious metals even at the present time, and still more so at remote periods. For ancient and mediæval times the reader may consult Jacob's *Historical Inquiry into the Production and Consumption of the Precious Metals*, published 1831, which was long regarded as the standard work on the whole subject. Recently, however, Dr Adolph Soetboer has made much more thorough investigations for the period 1493-1885, and his *Materials for the Study of the Precious Metals* is now the work most generally relied upon.

As regards the production of the precious metals, two great revolutions are to be observed in the 16th and 19th centuries. Between 1493-1520 the total production of gold and silver was in the proportion of about 57 per cent. of gold to 43 per cent. of silver (the value being reckoned at the actual value of the time), whilst between 1581-1600 the proportion became (in value) 17·2 gold to 82·8 silver. This change was principally due to the discovery of the silver mines of Potosi (1545). Between 1831-40 the production (in value) was 34·9 gold to 65·1 silver, and for the period 1851-55 the proportion had become 77·6 gold to 22·4 silver. This change was caused by the discovery of the great gold mines in Australia and California. The magnitude of these discoveries may be estimated from the fact that between 1493-1850 (358 years) the total production of gold is given at 4,752,070 kilograms, whilst between 1851-85 (35 years) it is given at 6,383,388 kilograms. The value of a kilogram of gold is £139, 10s. After 1855 the relative

production of gold to silver gradually declined, the figures for 1881-85 being 49.3 gold to 50.7 silver. The total production of gold (in value) was (1493-1850) about £663,000,000, and from 1851 to 1885 about £890,000,000; the total production of silver (estimated at its actual gold value at different times) was (1493-1850) about £1,472,000,000, and from 1851 to 1885 about £480,000,000. Annual gold production rose from £42,934,976 in 1897 to £97,985,185 in 1915. See *Gold Production Report* (1918).

The most remarkable fact in these changes is the slight effect on the ratio. Before the Potosí discoveries the ratio was (1521-40) about $11\frac{1}{2}:1$, and from 1601-20 it was only $12\frac{1}{2}:1$. Again, before the gold discoveries the ratio was (1841-50) $15.83:1$. In spite of the large gold increase (1851-55) it fell only $15.41:1$. The doubling of the annual gold output (1897-1915) coincided with a rise in the ratio (40:1). The rise in demand for silver during the war period (1915-19) more than restored the old parity (15:1). See Bimetallism.

The production of the precious metals must of course be compared with their consumption or use. The principal uses are for coinage, including keeping up the coins to their full weight, for the arts, and for hoards. It is estimated that £40,000,000 yearly of gold is absorbed by the arts and in exportation to the East.

Bullock's Heart. See CUSTARD APPLE.

Bull-roarer, a provincial English name for a boy's plaything, made of a piece of wood about 8 inches long and 3 broad, sharpened somewhat at the ends, to one end of which a string 30 inches or so in length is tied, then twisted tightly round the finger, when the whole is whirled rapidly round and round until a loud and peculiar whizzing noise is produced. An instrument of the same kind, called *turndan*, is still used by the native Australians to produce a sound warning off intruders during several religious mysteries; and Mr Andrew Lang not only collected evidence of its similar use in New Mexico, New Zealand, and South Africa, but identified it with the *rhombos* used in the ancient Greek mysteries, itself an unconscious survival of more ancient and more savage mysteries. See 'The Bull-roarer,' in Lang's *Custom and Myth* (1884); Haddon, *Study of Man* (1898).

Bull Run, a small stream separating Fairfax and Prince William counties in Virginia, about 25 miles W. by S. of Washington, and giving its name to a famous American battlefield, where two battles were fought during the Civil War on July 21, 1861, and August 29, 1862. In the first the Confederate army of 22,000 men, commanded by Beauregard, with reinforcements of 8000, after a hard-fought contest, routed the Union forces, 34,000 strong, under McDowell, and drove them back on Washington with a loss of 2950 men. The Confederates' loss was 1652. In the second battle the Union forces of 49,000 men, under Pope, were defeated by Longstreet, with 32,000 men, and T. J. Jackson, with 23,000. The Union loss was 11,000, that of the Confederates 7241. See UNITED STATES.

Bulls and Bears. In the slang of the stock exchange, a *bull* is a person who seeks artificially and unduly to raise the price of stock, and speculates on a rise. On the other hand, a *bear* is one who speculates on a fall; who sells stock for delivery at a future date, in the hope that meanwhile prices will fall, so that he will buy at a lower price what he has sold at the higher price. See STOCK EXCHANGE.

Bull Trout. This name has given rise to much confusion, since it is applied to different kinds of fish in different localities. In the Tweed

the bull trout is the variety of the sea-trout which may most accurately perhaps be given the scientific name of *Salmo trutta eriox*. It was at an earlier date described as a distinct species under the

Tweed Bull Trout.

name of *S. eriox*. It is also known as the Round Tail, since in well-grown examples the caudal fin, instead of being forked or even straight, is emarginate, has an outwardly rounded outline, and the whole tail a distinctly stunted appearance. The fish is found in greatest abundance not only in the Tweed, but also in the Coquet. The flesh is not of very high quality, and the fish is only very rarely caught by the angler. In the two rivers named it has practically supplanted the true sea-trout. In the Tay the name bull trout is given to salmon which have speckled markings on the region of the 'shoulder' and fresh-water maggots in their gills. These are salmon which have spawned, but which, after descending to the sea, have again entered fresh water while still bearing traces of their previous fresh-water life. Examples of these so-called bull trout are to be found in many rivers. They are often of large size, and their flesh is inferior to that of the salmon ascending to fresh water for the first time. They are not very numerous, because the salmon is an infrequent spawner, and commonly remains for one, two, or three years in the sea without entering fresh water. The great majority of salmon found in our rivers are on their first ascent from the sea. The name bull trout is also, and more loosely, given to fresh-water trout of large size and poor shape—fish which inhabit waters where food is not sufficient to fully nourish them. Under these circumstances the head appears unduly large; hence the name. See SALMON, TROUT.

Bülow, PRINCE BERNHARD HEINRICH KARL MARTIN VON (b. 1849), German Chancellor (1900-9), son of the foreign minister Bernhard Ernst von Bulow, was born at Klein-Flottbeck, Holstein. He entered the Foreign Office in 1873, held many diplomatic posts, and became minister to Rumania (1888), ambassador to Italy (1893). As Foreign Secretary (1897) he added the Caroline, Pelew, Ladrone, and Samoan Islands to Germany (1899). He resigned the chancellorship on the defeat of the Inheritance Tax Bill. He was made count in 1899, prince in 1905. Again ambassador at Rome, he sought in vain to keep Italy out of the Great War.

Bülow, FRIEDRICH WILHELM, BARON VON, Prussian general, was born in 1755, and entered the army young. When Prussia declared war with France in 1813, it was Bülow that commanded in the first successful encounter with the French at Möckern, and revived the self-confidence of the army after the adverse battle of Lützen. His victories over Oudinot and Ney at Gossbeeren and Dennewitz saved Berlin, and inflicted severe loss on the enemy. He acted a conspicuous part in the battle of Leipzig, and, by taking possession of Montmartre, finished the campaign of 1814. The king acknowledged his services by an estate worth £30,000, and the title of Count of Dennewitz. In the campaign of 1815 he joined Blücher by forced marches, and headed the column that first came to the aid of Wellington at Waterloo. He died at Königsberg, 25th February 1816.

Bülow, HANS, GUIDO VON, pianist, conductor,

and composer, was born at Dresden, 8th January 1830, the son of Karl Eduard von Bulow (1803-53), poet and author. He studied music with zeal, and after being sent to Leipzig and Berlin to qualify for a legal career, resolved to give himself to music. Having spent some time with Richard Wagner, he became in 1857 the pupil of Liszt, whose daughter Cosima, afterwards wife of Wagner (q.v.), he married. In 1854 he became Prussian court-pianist, in 1864 pianist to the Bavarian court, and head of a music-school at Munich. In 1869 family troubles led him to resign his appointments and retire to Florence, and subsequently he undertook great concert tours in England and America. In 1880 he settled as director of music to the court at Meiningen; and after a year in a lunatic asylum, he died 13th February 1894. One of the most brilliant pianists of his time, he was famous as a concert director, and as a representative of the Liszt-Wagner school, he produced works for piano and for the orchestra.

Bülow, KARL VON (1846-1921), German field-marshal, served with distinction in the Franco-German war. In the Great War he was blamed for the failure of the advance on Paris. See his *Mein Bericht zur Marneschlacht* (1920).

Bulrush, a name given to two distinct marsh plants of tolerably similar vegetative habit—*Typha latifolia* and *Scirpus lacustris*. The former

Bulrush:

A, Common Cat's-tail (*Typha latifolia*); B, Common Bulrush (*Scirpus lacustris*).

of these, also called Reed-mace or Cat's-tail, belongs to the Typhaceæ; it is a large handsome plant of grass-like habit, and reaching a height of 5 to 7 or 8 feet. The characteristic long flowering heads bear the male above the female flowers, although other species are dioecious. The cloud of pollen is collected to adulterate the Lycopodium (see LYCOPODIACEÆ) of pharmacy; the rhizome is astringent, but contains starch used by the Kalmucks; and the shoots of this and allied species are eaten by the Don Cossacks, and hence are sometimes called Cossack Asparagus. The stems of bulrushes are used in

many countries for thatching and fuel, the leaves for mats, chair-bottoms, packing, &c., the woolly fruiting heads as packing material, and in combination with feathers to stuff beds. Typha fibre was much used in Germany as a substitute for wool during the Great War.

The other and apparently rightful claimant of the name bulrush belongs to the Cyperaceæ. *Scirpus* is a large genus widely distributed through all climates, and applied to almost identical uses with the preceding where it sufficiently abounds. It is easily recognised by its compound umbel-like (but probably cymose) heads of spikelets. One species, *S. tuberosus* (or *Eleocharis tuberosa*), an important Chinese food-plant, is cultivated in India as a source of starch. The common British species may reach a height of 8 feet, and like *Typha* grows in vast swamp jungles along the margins of lakes and slow-running streams, to which they impart a characteristic picturesqueness. *S. maritimus* grows extensively along the shores of the Baltic.

Bulsar, a seaport of India, 115 miles N. of Bombay. Timber is the staple export. Pop. 16,000.

Bultfontein, a diamond mine near Kimberley (q.v.). See CAPE OF GOOD HOPE.—There is another Bultfontein in the Orange Free State, 90 miles ENE. of Kimberley; pop. 800.

Bulti, the northern part of Kashmir (q.v.).

Bul-tso ('Borax Lake') is a lake of Tibet, 100 miles NW. of Lhasa. Its area is 24 sq. m.

Buluwayo. See BULAWAYO.

Bulwer, HENRY LYTTON (1801-72), diplomatist and author, was an elder brother of Lord Lytton (q.v.), and was attached successively to the British embassy at Berlin, Brussels, and the Hague. In 1830 he was returned to parliament, and during the following seven years represented, as an advanced Liberal, the constituencies of Wilton, Coventry, and Marylebone. In 1837 he became secretary of embassy at Constantinople, where he negotiated and concluded a very important commercial treaty. In 1843 he was made minister plenipotentiary to the court of Madrid, and, as arbitrator, negotiated the peace between Spain and Morocco in the following year. His firmness and candour offended Narvaez, the Spanish marshal-dictator, who, pretending to have discovered Bulwer's complicity in certain plots, ordered him to leave Madrid. The House of Commons indorsed the whole course of his conduct, and he was made a K.C.B. in 1848, a G.C.B. in 1851. In 1849 he proceeded to Washington, where he concluded the Clayton-Bulwer Treaty (see CLAYTON); in 1852 to Florence, and in 1856 to Bucharest. From 1858 to 1865 he was ambassador to the Ottoman Porte, and as successor to Lord Stratford de Redcliffe, ably carried out Palmerston's policy on the Eastern Question. In 1871 he exchanged the familiar title, Sir Henry Bulwer, for that of Lord Dalling and Bulwer. He died at Naples, 23d May 1872. Among his works were *An Autumn in Greece* (1826); *France, Social, Literary, and Political* (1834-36); *A Life of Byron* (1835); *Historical Characters* (1868-70); and an unfinished *Life of Palmerston* (1870-74).

Bulwer Lytton, SIR EDWARD. See LYTTON.

Bumboat, a boat employed to carry provisions and other articles from harbours and ports to vessels lying at some distance from the shore. Boats of this kind belong to a class of petty traders, who in England are, for the most part, women.

Bumeli, See BULLET-TREE, SAPOTACEÆ.

Bummaloti. See BOMBAY DUCK.

Bunbury, HENRY WILLIAM, caricaturist, was the son of the Rev. Sir William Bunbury, and was

born at Mildenhall in Suffolk in 1750. Educated at Westminster and Cambridge, he early became distinguished for his humorous designs, which gave him the right to rank after Rowlandson and Gillray. He usually avoided political subjects. He drew mainly in pencil and chalks, but also produced water-colours. He died in 1811. His son, Sir Henry Edward Bunbury, seventh Bart. (1778-1860), wrote several historical works, including one on the Peninsular war.

Buncrana, a watering-place on Lough Swilly, 12 miles NW. of Londonderry by rail; pop. 2000.

Bundaberg, a port of Queensland, at the mouth of the Burnett River, and 272 miles N. of Brisbane by rail, in a great sugar district. It was destroyed by a flood in February 1893. Pop. 10,000.

Bundehesh is the name of a Pehlevi book which is an authority on Zoroastrianism. See ZEND.

Bundelkhand, a region of Upper India, between the rivers Chambal and Jumna. It includes districts belonging to the United Provinces of Agra and Oudh (Banda, Jalaun, Jhansi, Lalitpur, and Hamirpur), and also the 'Bundelkhand Agency,' a subdivision of the Central India Agency, which is a group of some 30 native states and petty jaghirs under native princes. The name is now most usually employed for the agency merely, which extends over an area of 10,000 sq. m., with a collective population of 1,750,000. Notwithstanding that the region in the wider sense is well watered, the climate renders irrigation indispensable; and it is accordingly intersected by artificial dams and a canal. It possesses deposits of iron ore, diamonds (in Panna), and copper, but the produce is almost solely agricultural. The principal towns of Bundelkhand are Kalpi, Jhansi, Kalinjar, Banda, Jalaun, Chhatarpur, and Datia.

Bundi, a native state of Rajputana, lying between Jaipur, Tonk, Kotah, and Udaipur. It is traversed from SW. to NE. by a double range of hills, has large tracts of woodland, and is drained by the river Mej. Area, 2220 sq. m.; pop. (1891) 295,675; (1921) 187,068, the decrease owing to the effects of famine. The inhabitants are nearly all Hindus. The chief town, Bundi, contains 425 temples and shrines.

Bundoran, a watering-place on Donegal Bay, 4 miles SW. of Ballyshannon; pop. 2100.

Bungalow, the species of house usually occupied by Europeans in the interior of India, and commonly provided for officers' quarters in cantonments. Bungalows are properly of only one story, with a veranda, and a pyramidal roof, generally of thatch, although tiles are sometimes substituted; houses of masonry, with terraced roofs, are distinguished as *pucca houses*. The name is a corruption of the native word *Banglā*, 'Bengalese,' and probably refers to the first district where the form of building was noticed by Europeans.—*Dak-bungalows* are houses for travellers, still to a reduced extent maintained by government, where bed, table, and bathroom are provided, and food can be had at a moderate cost. One rupee eight annas a day is charged for the use of these bungalows, which are found on the main routes every 10-15 miles, and on the less-frequented roads at intervals of 40-50 miles.

Bungay, an urban district of Suffolk, on the Waveney, 6 miles W. of Beccles. It grew up around the 12th-century castle of the Bigods, Earls of Norfolk, some ruins of which still remain; but mostly it is later than the great fire of 1688. It has a large printing establishment, and carries on a considerable trade in corn, malt, flour, coal, and lime. Pop. 3000.

Bungener, LOUIS FELIX, Protestant writer, born at Marseilles, of German family, in 1814, studied theology at Geneva, and became director of the gymnasium there in 1843, but was removed by the new Radical government in 1848. Engaging in literature, he published a series of writings on theological and historical subjects, but is most widely known for several works, in the form of romances, in which the principles of Protestantism are set forth and defended. He died 14th June 1874.

Bunias, a small genus of Cruciferae. The leaves of *B. orientalis* are eaten in Russia, and are cultivated in Western Europe as a fodder-plant. The leaves and root of *B. erucago* are eaten in Greece.

Bunion is a term applied in Surgery to enlarged bursae, or synovial sacs, situated on any part of the foot; but most common over the metatarso-phalangeal joint of the first or the fifth toe (see FOOT), and accompanied by more or less distortion of the joint. In the great majority of cases, bunions are directly produced by the pressure of badly-fitting boots; and if the boots are constructed of patent leather, or any material which stops the excreting action of the skin, this, too, may be regarded as an indirect cause of their formation. Sometimes, however, the tendency to suffer from bunions is hereditary, and almost irremediable. A bunion begins as a painful and tender spot at some point exposed to pressure; the part gradually enlarges, and there are indications of an effusion into a natural bursa or a newly-formed sac. The progress of the affection may stop here, the enlarged bursa remaining, and serving to protect the subjacent parts from pressure; but far more frequently the bunion undergoes repeated attacks of inflammation, causing further increase in size; or becomes the seat of corns or of suppuration. The last action may be followed either by obliteration of the cyst and a cure; or, especially in persons of languid circulation, by a troublesome form of ulcer. The one great thing, when there is a tendency to bunions, is the wearing of roomy boots or shoes, of soft and pervious material, and so shaped as not to press upon susceptible points. When pain occurs, wet lint covered with waterproof material, or poultices, should be applied, at all events at night. Enlargement may sometimes be reduced in its earlier stages by the application of iodine or a mercurial ointment. Where suppuration takes place, the sac should at once be laid freely open. The disease sometimes proves so troublesome that amputation of the toe, or excision of the ends of the bones affected, has been resorted to.

Bunker Hill, an elevation (112 feet) on the peninsula of Charlestown, now part of Boston, Massachusetts, connected by a ridge, 700 yards long, with Breed's Hill (75 feet). The two heights were the scene of the first hard-fought battle of the American Revolution (June 17, 1775), in which the Americans, from behind some works hurriedly constructed during the preceding night, repulsed two attacks by General Gage's forces, and were dislodged only after reinforcements had been brought up, and their ammunition was spent. The British loss was 1054, that of the Americans 449. A granite obelisk, 221 feet high, marks the site of the redoubt. See UNITED STATES.

Bunkum, a phrase used in the United States for mere bombastic speech-making, intended for the newspapers rather than to persuade the audience, and derived from a county named Buncombe in North Carolina. Most authorities agree that the proverbial use is to be referred to the congress of 1819-21, when, according to Wheeler's *History of North Carolina*, 'the member for this district

arose to address the house, without any extraordinary powers in manner or matter to interest the audience. Many members left the hall. Very naively he told those who remained that they might go too: he should speak for some time, but he "was only talking for Buncombe."

Bunn, ALFRED (1796-1860), was in 1833-40 manager both of Covent Garden and Drury Lane Theatres, brought out the chief of Balfe's operas, and wrote or translated most of his libretti (see BALFE). 'Poet Bunn' is best known by his songs in these; but he wrote many 'occasional verses.'

Bunsen, CHRISTIAN KARL JOSIAS, BARON, the distinguished German diplomatist and scholar, was born 25th August 1791, at Korbach, in the principality of Waldeck, and studied at Marburg, Göttingen, Copenhagen, and Berlin. In 1816 he went to Paris, and studied Persian and Arabic under Silvestre de Sacy, and in the same year to Rome, where he married Frances Waddington (1817), and was appointed (1818) secretary to the Prussian embassy on the recommendation of Niebuhr, then Prussian ambassador. On Niebuhr's departure from Rome (1824), Bunsen, who during Friedrich-Wilhelm III.'s visit to Rome in 1822 had gained the king's favour by the frank expression of his views on the Prussian ritual and hymn-book question, conducted the embassy provisionally for a time, and was appointed resident minister in 1827. Bunsen employed the years of his Roman sojourn partly in the study of Plato and the constitutions of antiquity; and still more in biblical inquiries, Egyptology, and researches into the history of the Christian church and its liturgies. He contributed largely to the *Beschreibung der Stadt Rom* (3 vols. Stutt. 1830-43), and wrote the explanatory text to the volume of engravings *Die Basiliken des Christlichen Roms* (Munich, 1843). The Archaeological Institute, established at Rome in 1828, found in Bunsen its most active supporter, and it was at his instance that Lepsius obtained from the Prussian government the means for his expedition to Egypt in 1842. He founded a Protestant hospital on the Tarpeian Rock, and with the help of Richard Rothe, then chaplain to the embassy, introduced into the services there a remodelled liturgy, the most part of which was afterwards embodied in his anonymous *Gesang- und Gebetbuch zum Kirchen- und Hausgebrauch* (1846), which has found very great favour in Germany. Becoming involved in the question of mixed marriages, and in the disputes between the Prussian government and the Archbishop of Cologne, he saw his position as Prussian ambassador at the papal court compromised, and, being recalled from Rome in 1838, he was appointed in 1839 Prussian ambassador at Bern. In 1841 he was sent on a special mission to London, to negotiate the erection of an Anglo-Prussian bishopric in Jerusalem, and in the next year was appointed ambassador at the English court. On a visit to Berlin in 1844, he represented the urgency for a deliberative assembly, and also made a complete plan of a constitution for Prussia closely resembling the English. In the Sleswick-Holstein question, Bunsen strongly advocated the German view, in opposition to Denmark, and protested against the London protocol of 1850, but was obliged to sign the treaty of 1852. His views regarding the part that Prussia should act in the Eastern question not being in accordance with those of his court, he ceased in 1854 to represent Prussia at the court of England, and retired to Heidelberg. In 1857 he was created a baron, with a seat in the Prussian Upper House. The last two winters of his life were spent at Cannes, and, settling at Bonn in 1860, he died there on the 28th November of that year.

Arnold accounted it a privilege to sit at Bunsen's

feet, and to Thirlwall, Hare, and Whewell, Bunsen (who had a hearty sympathy with England and Englishmen) was a hero. He was all his life an ardent student, and all his investigations tended to the one aim which he set before himself at the beginning of his career—'the knowledge of God in man, especially in language and religion.' His eager desire for positive results and his lively imagination led him in many cases to form premature conclusions, and the fresh impulse which he gave to the studies of others has been a still greater service to religion and science than his own researches. His chief works are: *Die Verfassung der Kirche der Zukunft* (1845; Eng. ed. *The Constitution of the Church of the Future*, 1847); *Die drei achten und die vier unachten Briefe des Ignatius von Antiochien, und Ignatius von Antiochien und seine Zeit* (Hamb. 1847); *Aegyptens Stelle in der Weltgeschichte* (6 vols. 1844-57), of which the English edition (1847-67), with many additions by Bunsen and Samuel Birch, is the more valuable; *Hippolytus and his Age* (2 vols. 1852), which was specially written for English readers, and in its second edition formed part of the extensive work, *Christianity and Mankind* (7 vols. 1854), including 3 vols. of *Analecta Ante-Nicæna*, with contributions by Lagarde and other scholars, and *Outlines of the Philosophy of Universal History as applied to Language and Religion* (2 vols.), with contributions by Aufrecht and Max Müller; *Die Zeichen der Zeit* (2 vols. Leip. 1855; Eng. trans. by Susanna Winkworth); *Gott in der Geschichte* (3 vols. Leip. 1857-58); and the *Bibelwerk für die Gemeinde*, completed by Kamphausen and Holtzmann in 9 vols. (1858-70). See Bunsen's *Memoir* (2 vols. 1868) by his widow, Frances Waddington (1791-1876), and her own *Life and Letters* by Hare (2 vols. 1879). His correspondence with Friedrich-Wilhelm IV. was published by Ranke in 1873. His five sons were Heinrich (1818-85), rector of Donington, Shropshire; Ernst (1819-1903), author of *Bible Chronology* and other works; Georg (1824-96), Prussian statesman; and the diplomatists, Karl (1821-87) and Theodor (1832-92).

Bunsen, ROBERT WILHELM, a distinguished German chemist, born at Göttingen, March 31, 1811. He began the study of zoology, chemistry, and physics at the university of his native town, and continued them at Paris, Berlin, and Vienna. After having lectured at Göttingen and Cassel, he filled the chair of chemistry in succession at Marburg, Breslau, and, from 1852, Heidelberg. His papers on physics and geology, as well as on chemistry, are numerous. The charcoal pile and the burner which bear his name are in extensive use. That the hydrate of oxide of iron is an antidote to arsenic, is an important fact which was made known by him, along with his friend Berthold, in 1837. Bunsen was the first to produce magnesium in large quantities; and in 1860 he invented the magnesium light, which has proved so important to photography. But the greatest discovery with which his name is associated, is that of the spectrum analysis—made in conjunction with his friend Kirchhoff—which has been the means of working so many wonders in chemistry, and revealing so much to astronomers. Its first result was the discovery of two new metals. Besides his original work in chemistry, Bunsen proved himself also one of its most successful teachers, with a singularly happy manner of demonstration. Among his works are: *Enumeratio ac Descriptio Hygrometrorum* (1830), *Das Eisenoxydhydrat* (2d ed. 1837), *Gasometrische Methoden* (1837; English by Roscoe), *Einleitung zur Analyse der Aschen u. Mineralwässer* (1874), and *Flammenreaktionen* (1880). The government of Baden made him a privy-councillor in 1863. He died 16th August 1899. See *Nature* for 1881, 1899.

Bunsen Burner. Probably no invention has done so much to facilitate work in the chemical laboratory as that of the Bunsen burner, so named after the distinguished chemist. Prior to its introduction, the heating by gas or oil had been unsatisfactory, owing to the imperfect combustion of the carbon causing the deposit of soot on any body in contact with the flame. Applying the principle of the Blowpipe (q.v.), a plentiful supply of air was caused to mingle with the gas before ignition, so that a smokeless flame of low luminosity but great heating power was the result. The Bunsen burner

Bunsen Burner.

has undergone many changes, by which it has been adapted to the various requirements of domestic life, but through all, the essential principle remains the same. The simplest form consists of an ordinary gas-jet, over which is placed a piece of metal tube, 4 to 6 inches long, and perforated with holes at the bottom. The gas having been turned on, air rushes in at the holes, so that when a light is applied to the upper end of the tube, a greenish-blue flame is obtained. If the air is in excess, the flame inclines to green; if deficient, a yellow flame results. The great objection to this, the original form, lies in its tendency to *burn back*, if the gas pressure be but small. When this occurs, and the flame burns at the jet, before it mixes with the extra volume of air, a long smoky flame issues from the tube, while the disagreeable odour of acetylene, C_2H_2 , a product of the imperfect combustion of coal-gas, at once becomes apparent. To remedy this drawback, wire-gauze, through which flame cannot pass, is sometimes placed over the aperture, forming a 'solid flame' burner, or the mixture of gas and air is allowed to issue through small holes or narrow slits. For cooking, heating, ironing, soldering, &c., the value of the Bunsen burner is well known. The ordinary incandescent gas burner is another example. A mantle of special material is fixed in the hot part of the flame, the heat being sufficient to raise it to incandescence.

Bunt, a parasitic disease of cereals, due to *Tilletia caries*, a mould belonging to the Ustilaginaceae. See SMUT, PLANTS (DISEASES OF).

Bunter Sandstein, or 'variegated sandstone,' is the lowest member of the Triassic system. As the Trias is more perfectly developed in Germany than in Britain, the German beds are considered the typical group of this system. The bunter sandstein consists of various coloured sandstones, interstratified with red marls and thin beds of limestone, which occasionally, as in the Harz, are oolitic, but in other places dolomitic. They attain a maximum thickness of 1500 feet. The English representatives of the bunter sandstein are chiefly developed in Lancashire and Cheshire, and consist of red and mottled sandstones with beds of marl, and thick rather irregular bands of partially consolidated conglomerate called 'pebble beds.' Many species of fossil plants have been found in the bunter sandstein of Germany, consisting chiefly of ferns, cycads, and conifers. The English bunter sandstein, however, is for the most part unfossiliferous, an equisetum, one or two ferns, and a few

conifers being all the plants yet met with. But the most remarkable fossils in this formation are the remains of huge amphibians. Originally, the footprints which had been left by the animals on the moist sand were alone observed. From their resemblance to the impressions made by a human hand, the animal producing them was provisionally named *Cheirotherium* (q.v.). The subsequent discovery and examination of the remains of teeth and bones in the same beds have afforded sufficient materials to enable Owen to reconstruct an animal named by him *Labyrinthodon* (q.v.), which undoubtedly produced the footprints. (More recently these footprints have been assigned to more than one form of *labyrinthodon*.) These remains have been detected in Lancashire and Cheshire, as well as in Germany.

Bunting, JABEZ, Wesleyan minister, was born at Manchester in 1779, and in 1799 entered the ministry, in which he was very successful. He was president of the conference in 1820, and again in 1828, 1836, 1844. In 1835 he was chosen president of the Wesleyan Theological Institute, and he acted as second secretary to the Wesleyan Missionary Society for upwards of twenty years. He was the chief authority in all matters relating to the government and polity of Wesleyan Methodism. He died 16th June 1858. See his Life by his son (1887).

Bunting (*Emberiza*), a genus of birds in the great finch family Fringillidæ. They are nearly allied to the crossbills. The most marked characteristics are a short, straight, conical bill; a curved form of the gape, produced by a narrowing of the sides of the upper jaw, and a corresponding enlargement of the under one; and a hard rounded knob on the palate or inner surface of the upper jaw. This knob probably aids in crushing the seeds, which are a principal part of the food of these birds. The species of bunting are numerous, and may be arranged in several sub-genera.—The Common Bunting, or Corn Bunting (*E. miliaria*), is a bird considerably larger than a house-sparrow, brown, with darker streaks on the upper parts, whitish brown with spots and lines of dark brown on the under parts, and with a slightly forked tail. It is frequent, particularly in low cultivated grounds in Britain, and in most parts of Europe, extending also into Asia, living in pairs during spring and summer, but in flocks in winter, and often visiting barn-yards at that

Reed Bunting (*Emberiza schoeniclus*).

season, along with chaffinches and sparrows. It is the largest of the British buntings. It is supposed that the winter flocks in Britain are much increased by migration from more northerly regions. This bunting often passes the night on

the ground in stubble-fields, and is taken in the nets employed for catching larks, and brought with them to market. It usually builds its nest on or very near the ground. Its notes are harsh and unmusical, and sometimes sound like the clicking of knitting needles.—The Reed Bunting, or Black-headed Bunting (*E. schoeniclus*), is a species common in marshy situations, both in Britain and on the continent of Europe. It feeds much on willow and other buds. It is a very pretty little bird, in the male with black head, cheeks, and upper throat; in the female with brown instead of black, and with a white throat.—The Cirl Bunting (*E. cirius*), of which the head is olive-green, with black streaks, and with patches of bright lemon-yellow on the cheeks and over the eyes, is a rare British bird, and belongs chiefly to the south of Europe and the north of Africa. To this genus belong also the Ortolan (*E. hortulanus*, q.v.), and the Yellow-hammer (*E. citrinella*, q.v.).—The Snow Bunting (q.v.), or Snowflake (*E. nivalis* of many authors), has been placed in the new genus *Plectrophanes*. The name bunting has been often very vaguely used, and many species have been almost indiscriminately called buntings or finches. The palatal knob affords the best distinctive character. North America has a large number of species of bunting.—The Black-throated Bunting (*E. americana*) is extremely plentiful on the prairies of Texas and other south-western parts of the United States; extending, however, as far as to Ohio, and even to Massachusetts. In the middle and northern states it occurs only as a summer bird of passage. In its habits it closely resembles the Common Bunting of Europe; but the palatal knob is less hard. See Macgillivray's *British Birds*, vol. i.

Bunting, or BUNTINE, is a thin woollen material of which the flags and signals of ships are usually made.

Bunyan, JOHN, author of the *Pilgrim's Progress*, was born at Elstow, near Bedford, in 1628. His father describes himself in his will, the original of which is still in existence, as a 'braseyer,' and is ordinarily spoken of as a tinker, in which craft his eldest son John was duly trained. Sir Walter Scott, in the *Quarterly Review* of 1830, started the idea that, as Gypsies were frequently tinkers, Bunyan may have belonged to the Gypsy race. Recent researches, however, have shown that there is no historical basis for the suggestion. The name originally took the form Buington, and the family were certainly in Bedfordshire in 1199, if not earlier. There is also documentary evidence connecting them with the identical spot where Bunyan was born, in the east fields of Elstow, as early as 1327. From the Court Roll of the manor of Elstow we find that Thomas Bonyon did fealty and suit of court for his cottage and nine acres of land to the lord of the manor in 1542 and on to 1550. In a minute of the Privy-council he is described as 'Bonyon, victualler,' and in the Court Roll of the manor as a 'common brewer of beer' and as a 'common baker of human bread.' He probably kept a little roadside inn in his cottage on the bridle-road between Bedford and Wilstead. The place where he lived is also described in the same record as 'Bonyon's End,' that is, the end or extremity of the parish where the Bunyans lived. This is the name which it had evidently borne for a long time previously, and it is the name by which that part of Elstow has continued to be known down to our own day. The grandson of this Thomas Bonyon, who was Bunyan's grandfather, describes himself in his will as a 'pettie chapman,' or small village trader. According to the transcript registers from the parish of Elstow, Bunyan's father married Margaret

Bentley on the 23d May 1627, and on the 30th November 1628 their illustrious son was baptised at Elstow Church. When he was in his sixteenth year his mother and his sister Margaret died within a month of each other; and the following year Bunyan, probably under the action of a levy made by parliament upon the villages of Bedfordshire, was drafted into the army, and took part in the civil war between Roundhead and Royalist. Probably not for long, however, as he did not reach the army regulation age of sixteen till November 1644, and in June 1645 the battle of Naseby practically put an end to the war. On the disbanding of the army, Bunyan returned to Elstow, and about 1649 married a wife who brought him no dower of worldly wealth, for, says he, 'this woman and I came together as poor as poor might be, not having so much household stuff as a dish or spoon betwixt us both.' She brought with her, however, two books which had belonged to her father, the *Plain Man's Pathway to Heaven*, and the *Practice of Piety*, in which they read together, and by which Bunyan was considerably influenced. His *Life and Death of Mr Badman*, which he published in 1680, shows not a little resemblance to the first of these books. During these early days of his wedded life, he lived in the cottage at the entrance of the village of Elstow, now known as Bunyan's cottage, the house in which he was born being in the fields about a mile to the east. It was while living here that his blind child was born, and that he took such pleasure in ringing the bells in the tower of Elstow Church. It was here also that he began to pass through those deep religious experiences which he has described so vividly in his *Grace Abounding*.

During this time he was introduced by some good people at Bedford to their minister, John Gifford, a converted royalist major who had organised a little community, sometimes incorrectly described as a Baptist church, it being a church in which baptism and some other questions much debated in those days were left to the individual conscience, and not made an essential part of church life. Bunyan joined this Christian fellowship in 1653, and about 1655 he was asked by the brethren to address them in their church gatherings. This led to his beginning to preach in the villages round Bedford, and in 1656 he was brought into discussions with the followers of George Fox, which issued in his appearance as an author, his first book, *Some Gospel Truths Opened*, being published against the Quakers in 1656. This earliest effort of his pen, though rapidly written, is a vigorous production, and altogether remarkable as the composition of a working-man whose school-days had become a far-off memory. To this Edward Burrough, an eminent Quaker, replied, and Bunyan gave rejoinder in *A Vindication of Gospel Truths Opened*. Two other works were published by him, after which, in the month of November 1660, he was arrested while preaching in a farmhouse at Samsell, a little hamlet a few miles south of Ampt-hill. The imprisonment which followed upon this arrest lasted for twelve long years, during which Bunyan wrote *Profitable Meditations, Praying in the Spirit, Christian Behaviour, The Holy City, The Resurrection of the Dead, Grace Abounding*, and some smaller works. This imprisonment was in the county gaol, which stood at the corner of the High Street and Silver Street, in the centre of the town of Bedford. Bunyan was released after the Declaration of Indulgence of 1672, under which he became a licensed preacher, having been chosen by the church to which he belonged as their pastor. He had occupied this position for three years, when in the month of February 1675 the Declaration of Indulgence was cancelled, and the licenses of the

Nonconformist preachers recalled by proclamation. The following month, March 4, a warrant, signed by no fewer than thirteen magistrates, and sealed by ten out of the thirteen, was issued for his arrest. This warrant turns out to have been preserved among the Chauncy MSS., and came to light in July 1887 when these were brought to the hammer at Messrs Sotheby's. Brought to trial at the midsummer sessions under the Conventicle Act, Bunyan was sent to prison for six months in the town gaol on Bedford Bridge. It was during this later and briefer imprisonment, and not during the twelve years in the county gaol, that he wrote the first part of his memorable work, the *Pilgrim's Progress*. This was entered in the register of the Stationers' Company, 22d December 1677, and in a contemporary catalogue of books appears as licensed February 18, 1678. When first issued it was shorter than it afterwards became. It then contained no Mr Worldly Wiseman, and no second meeting with Evangelist. The discourse with Charity at the Palace Beautiful, the further accounts of Mr By-ends's rich relations, the story of Diffidence, the wife of Giant Despair, and various other passages, were added afterwards in the second and third editions, which appeared in the autumn of 1678 and the early part of 1679. This was followed by the *Life and Death of Mr Badman* in 1680; by the *Holy War*, his most memorable work after the *Pilgrim's Progress*, in 1682; and by the second part of the *Pilgrim*, containing the story of Christiana and her children, in 1684. Bunyan had been pastor of the Bedford Church for sixteen years, when, after a ride through the rain on horseback from Reading to London, he was seized with a fatal illness at the house of his friend, John Strudwick, a grocer at the sign of the Star on Snow Hill, Holborn, and here he died on the 31st August 1688, and was buried in the *Campo Santo* of the Nonconformists in Bunhill Fields.

During the sixty years of his life, Bunyan wrote something like sixty books, but he will be best remembered by three of these—the *Grace Abounding*, the *Holy War*, and the *Pilgrim's Progress*, and best of all by the last of the three. The *Pilgrim's Progress* sprang at once into fame, 100,000 copies being sold during the subsequent ten years of its author's life. It was also printed at Boston, in New England, in 1681, and a Dutch translation was issued by Joannes Boekholt of Amsterdam in 1682. This last and a subsequent edition of a superior character, issued in 1685, were illustrated by Dutch engravers, then the leaders of the art of engraving in Europe. The book was also translated into Welsh, Walloon French, German, Polish, and Swedish, between 1688 and 1743. Since then it has been translated into no fewer than eighty-four languages and dialects, the versions in Japanese and the Canton vernacular being admirably illustrated by native artists, who have adapted the scenery and costumes to those of their own country. Traces of the influence of the work upon Schiller have been pointed out in two poems, 'Der Pilgrim' and 'Die Sehnsucht;' Wieland first learned English from the *Pilgrim's Progress*. Of the first edition six copies of the first part only were known till 1901, when a seventh was sold at Sotheby's for £1475; and there is a complete series of editions down to the thirty-fourth, with the exception of the seventeenth. Since the thirty-fourth no record has been kept, the editions becoming in number numberless. An incomplete folio edition of Bunyan's general works was published in one volume in 1692, and complete editions in two volumes folio were issued in 1736-37, and in 1767. A folio edition in one thick volume of 1112 pages, double columns, was also published in Edinburgh by Henry Galbraith in 1771, and various other collected editions in quarto

and octavo were subsequently issued in England, Scotland, and America.

See the Lives of him by Southey (1830), Offor (1862), Froude (1880), John Brown (1885; new ed. 1888), Venables (1888), and Hale White (1904); and C. K. Wright, *Bunyan as a Man of Letters* (1916).

Bunyip, a fabulous animal resembling a seal, which, according to the Australian natives, lives in swamps and water-holes. Europeans, they say, are unable to see it.

Bunzlau, a town of Prussian Silesia, on the Bober, 25 miles WNW. of Liegnitz by rail, manufactures earthenware, woollens, glass, and hosiery; and there is trade in corn, wool, and cattle. Here Opitz was born. Pop. 15,000.—**JUNG BUNZLAU** (*Czech Mladá Boleslav*) is a town of Bohemia, on the Iser, 32 miles NE. of Prague by rail, manufacturing woollens, starch, spirits, and soap. It was once a centre of the Bohemian Brethren. Pop. 16,000.

Buol-Schauenstein, KARL FERDINAND, COUNT, Austrian statesman, born 17th May 1797, was minister in succession at Karlsruhe, Stuttgart, Turin, and St Petersburg. He was second Austrian plenipotentiary at the Dresden Conference (1850), after which he was minister at London, until the death of Schwarzenberg recalled him to Vienna, to hold the portfolio of foreign affairs. He presided at the Vienna Conference in 1855, and represented Austria at the Congress of Paris. He died October 28, 1865.

Buonarroti. See MICHELANGELO.

Buondelmonti. See FLORENCE.

Buononcini, or BONONCINI, GIOVANNI MARIA (1640-78), wrote instrumental pieces, songs, and church music. His sons, Marc Antonio (1660-1726) and Giovanni Battista (1672-1750), were known as composers of operas. The latter settled in London in 1720, and for some years was a very popular rival to Handel (q.v.).

Buoy is a floating mark placed in the navigable track of vessels to indicate the existence of a sunken danger. They are made of various shapes and colours so as to indicate on which hand vessels must keep them in passing. A conference of the nautical authorities of Great Britain resolved in 1883 to adopt a uniform scheme of buoyage. The principal features of this scheme were that buoys showing the apex of a cone above water should be known as conical buoys, and should always be starboard-hand buoys; buoys showing a flat top above water should be called can buoys, and should be port-hand buoys; and buoys showing a domed top above water should be called spherical, and should mark the ends of middle grounds. In addition, port-hand buoys in Scotland must be painted black, and starboard-hand buoys red. Spherical buoys are distinguished by white stripes. The starboard buoys are on the right hand when the vessel is ascending a river, and on the coast the starboard buoy is on the right hand when the vessel is going with the main stream of flood-tide. Wreck buoys are painted green, and are marked 'Wreck.'

The Courtenay buoy is conical, and is surmounted by a large deep-toned whistle. From the lower end a large tube descends about 30 feet, where the water is not much affected by the surface undulation, and the surface of the water inside this tube stands at the mean level of the ocean, while the buoy rises and falls by the swell of the sea. There is accordingly an alternate inhaling and exhaling of air, which impinges on the edge of the whistle and produces a deep loud sound, heard in favourable circumstances five miles away. The bell buoy is formed as a large segment of a sphere, the flat side being uppermost. On this is erected a

framework which carries a bell of 3 to 7 cwt. The bell is a fixture, and is rung by the swinging of movable clappers, or by cast iron balls guided to roll against the lip of the bell. It is not nearly so efficacious as the Courtenay buoy.

Lighted Buoys.—River buoys are in many cases lighted by compressed oil-gas on Pintsch's principle,

The Courtenay Automatic Sound-ling Buoy:

a, cylinder; b, mooring shackles; c, rudder; d, buoy; e, diaphragm; f, ball-valves; g, air inlet tubes; h, outlet tube to whistle; i, compressed-air inlet to buoy; k, man-hole; l, steps; m, whistle.

Electricity has been employed for the lighting of buoys, but acetylene is now largely used, being generated within the buoy and led up to the burner. Sometimes the acetylene is dissolved in acetone, and enclosed in cylinders which can be attached to the buoys. The light is made to flash or occult by means of a valve worked by the flow of the gas. In recent years mantle burners are largely used on buoys. For Life-buoy, see LIFE-SAVING APPLIANCES.

Buoyancy is that quality whereby a ship, or any other floating body, is enabled to support a certain weight. In the case of a ship, it is necessary that such weight should be carried without her sinking too deeply in the water, or floating too lightly on it. The weight of a ship, not loaded with any cargo, is exactly equivalent to the weight of the volume of water she displaces (see HYDROSTATICS). Therefore, given a certain draught-line to which a ship is to be loaded, multiply the number of cubic feet of the volume of the immersed part by the weight of a cubic foot of sea-water (64 lb.), and the product will be the weight of water displaced by the ship at the given draught-line. If from this the weight of the ship herself be subtracted, the residue is the amount of extra weight, or cargo she is capable of carrying at that draught-line, and is a measure of her quality of buoyancy.

Bu'phaga. See BEEF-EATER.

Buprestis, a genus of beetles, typical of a large family—Buprestidae. Those occurring in warmer countries are conspicuous for lively colour and metallic sheen. Some of them are popularly known as Golden Beetles. *B. gigas*, found in Cayenne, is about 2 inches long. Some small species occur in England. The larvæ bore tunnels

in wood. The adults are drawn from their hiding-places among plants by the warmth and brightness of the mid-day sun, with which their own vividness seems so markedly in harmony. The wing-cases of

Buprestis Bicolor.

Larva of Buprestis gigas.

some species are used to enrich the embroidery of the Indian zenana, and the joints of the legs are also strung into necklaces and bracelets.

Bur, in an engraving, is a slight ridge of metal raised on the edges of a line by the *graver* or the *dry point*. It produces an effect like a smear, and is therefore usually regarded as a defect, and scraped off. Some etchers, however, take advantage of it to deepen their shadows, and Rembrandt made use of it in this way with telling effect. As the bur soon wears off, in valuable old proofs its presence is strong evidence of the early date of an impression.

Bur. See BURDOCK, THISTLE.

Bura'no, an island and town of northern Italy, 5 miles N.E. of Venice. The inhabitants engage in fishing and horticulture. There is a school for the designing and making of fine laces—once a famous local manufacture. Pop. 8000.

Burbage, RICHARD, a great English actor, born about 1567, the son of James Burbage, an actor, who built the 'Theatre,' Shoreditch (1576), and the second Blackfriars Theatre (1596). Richard made his debut in 1583, soon outstripped all competitors, and earned the title of 'Roscius.' The death of his father in 1597 brought him a share in the Blackfriars Theatre, and in 1599, together with his brother Cuthbert, he pulled down the Shoreditch house, and built with the materials the famous Globe Theatre as a summer playhouse, while the Blackfriars was to become exclusively a winter house. For the expenses of building Burbage had to borrow money, and he took as partners Shakespeare, Hemmings, and others. At these two theatres Burbage gained his greatest triumphs, and took the leading part in almost every new play until his death in 1619. Though short and stout in person, he played heroic tragedy with great fire and genius, and Overbury tells us of the modulations of his voice, and his 'full and significant action of body.' Richard III. was one of his most popular parts. Burbage was a not unskilful painter, and an undoubted picture of his is preserved at Dulwich. See Mrs C. C. Stopes, *Burbage and Shakespeare's Stage* (1913).

Burbank, LUTHER, American plant-breeder, born at Lancaster, Mass., in 1849, by indefatigable experiment obtained many new fruits and flowers at Santa Rosa, Cal. See *Life* by H. S. Williams (1916).

Burbot (*Lota vulgaris*), a fish closely allied to the Ling (q.v.), and remarkable as the only freshwater species of the Cod family (Gadidae). It is found in the Cam, the Trent, and other rivers of the eastern and midland counties of England, but is one of the most local of British fresh-water fishes. It is found also in various parts of middle

Europe, and in Asia. In English rivers, it often reaches 2 or 3 lb. in weight, but has been taken of 8 lb. weight; and in some parts of Europe, it is said to reach as much as 10 or 12 lb. In appearance, the burbot very much resembles the

Burbot

ling, but is rather thicker at the neck, and tapers somewhat more rapidly, although still of a somewhat elongated form. It has two dorsal fins, the first short, the second very long, and a very long anal fin. It differs from the ling in the form of the tail-fin, which is oval and slightly pointed; but agrees with it in having a single barbule on the lower jaw. It is of a greenish-brown colour, clouded and spotted with darker brown on the upper parts, the under parts lighter; the scales are small; and the whole body is covered with a mucous secretion. The flesh is white, firm, and of good flavour. The burbot usually keeps to the bottom of deep water, and swims up the river at spawning times (midwinter). It can survive for a long time out of water. It is commonly taken by trimmers and night-lines, as it feeds principally during the night. Its food consists of small fishes, worms, molluscs, fish-spawn, &c. Its liver yields an oil similar to cod-liver oil. It is one of the hosts of the asexual stage of the formidable parasite, *Bothriocephalus* (q.v.).

Burckhardt, JOHN LEWIS, traveller, born at Lausanne, Switzerland, in 1784, was educated at Neuchâtel, Leipzig, and Göttingen. In 1806 he came to London with an introduction from Blumenbach to Sir Joseph Banks, the leading spirit of the African Association, who accepted his services to explore the interior of Africa; and in 1809 he embarked for Malta, having previously qualified himself for the undertaking by a study of Arabic, and also by inuring himself to hunger, thirst, and exposure. From Malta he proceeded, under the disguise of an oriental dress and name, to Aleppo, where he studied more than two years, at the end of which time he had become so proficient in the vulgar Arabic, that he could safely travel in the disguise of an oriental merchant. He visited Palmyra, Damascus, Lebanon, and other remarkable places, and in 1812 went to Cairo, his object being to proceed from thence to Fezzan, and so to the source of the Niger. No opportunity offering itself at the time for that journey, he went into Nubia, and thence in 1814 proceeded to Mecca, one of the very first Christians to perform the pilgrimage. So completely had he acquired the language and ideas of his fellow-pilgrims, that, when some question arose respecting his orthodoxy, he was thoroughly examined in the Koran, and was not only accepted as a true believer, but was highly commended as a great Moslem scholar. In 1815 he returned to Cairo, and in the following year ascended Mount Sinai. The Fezzan caravan, for which he had waited so long, was at last about to depart, and Burckhardt had made all his preparations for accompanying it, when he was carried off by dysentery at Cairo, October 15, 1817. He was buried, as a holy pilgrim, in the Moslem cemetery. His collection of oriental MSS., in 350 volumes, was left to the university of Cambridge. His journals of travel, remarkable alike for their interest and evident truthfulness, were published in 1819-30 by the African Association.

Burdekin, a river of Queensland, draining the district of North Kennedy. It rises in the ranges behind Cardwell, and flows south-east for nearly 300 miles to a junction with the Belyando, which has come an equal distance northwards. The Burdekin then runs north into a delta emptying into Bowling Green and Upstart bays. It was discovered by Leichhardt in 1845, and explored by Dalrymple and Smith in 1859-60.

Burden, a term of law in Scotland, used to signify any restriction, limitation, or encumbrance affecting either person or property. With regard to mere personal burdens, or obligations to pay, no difficulty occurs. But if the payment of a sum of money is intended to make a real burden on land, or to be secured on land which is being conveyed, care must be taken to give the exact sum and the name of the creditor (or by reference to recorded deeds to give the means of ascertaining these), and to state distinctly (although no particular form of words is essential) that the money is to be a burden or charge on the land. Registration of such words in the Register of Sasines is essential to the validity of the burden. The creditor in a real burden can point the movables on the land, and can adjudge the land itself, and thereafter sue the tenants for rent. Real burdens may now be conveyed or extinguished in the same manner as other heritable securities.

Burden of Proof, in legal procedure, signifies the obligation to establish by evidence certain disputed facts; and, as a general rule, this burden lies on the party asserting the affirmative of the issue to be tried or question in dispute, or on the party who would fail if no evidence were adduced on either side. Accordingly, it almost always rests on the plaintiff or pursuer in an action, or on the party asserting the facts on which the result of the litigation must depend. There may, however, be such a legal presumption in favour of the pursuer, that the burden falls on the defender. Thus, where a deed granted by a client in favour of a law-agent is impeached, the law-agent would have to prove that it was properly obtained, and afterwards confirmed by the client. And matters alleged in defence must of course be proved by the defender. Thus, in an action for infringement of patent, it is presumed, unless the defender proves the opposite, that the patent was for an original and meritorious invention. In fact, all the legal presumptions—e.g. in favour of innocence of charges of crime and fraud, in favour of the course of business having been followed, in favour of the onerosity of bills of exchange (i.e. that they were granted for value)—throw the burden of proof on the party contradicting these presumptions. A party is generally bound to prove what is peculiarly within his knowledge. The general presumption in favour of innocence is, in the case of certain statutory offences, displaced by statute for reasons of public policy, the burden being put on the accused of disproving an inference of guilt arising in particular circumstances. This subject is treated by all the writers on Evidence. See also Bentham's *Rationale of Judicial Evidence*.

Burder, GEORGE, Congregationalist minister, was born in London in 1752. He studied for an artist and engraver, but in 1776 began preaching, and in 1778 was appointed pastor at Lancaster. He removed in 1783 to Coventry, and in 1803 to London. Here he became secretary to the London Missionary Society, and editor of the *Evangelical Magazine*. He died 29th May 1832. His *Village Sermons* have been translated into many languages; and he was the author of other series of sermons and publications which have had an immense circulation. See his *Life* by H. Burder (1833).

Burdett, SIR FRANCIS, Bart., the most popular English politician of his time, was born 25th January 1770. Educated at Westminster and Oxford, he spent three years (1790-93) on the Continent, and was a witness of the progress of the French Revolution. In 1793 he married Sophia, youngest daughter of Coutts, the wealthy London banker; in 1796 was elected M.P. for Boroughbridge, Yorkshire, and in 1797 succeeded to the baronetcy. In the House of Commons he made himself conspicuous by his opposition to the war, and his advocacy of parliamentary reform, Catholic emancipation, freedom of speech, prison reform, and other liberal measures, most of which were afterwards carried. One of the most effective political speakers of that excited period, he for many years prominently occupied public attention, and was the idol of the London populace. His candidature for Middlesex in 1802 involved him in four years' costly and fruitless litigation; but in May 1807, in which same month he fought a duel with a Mr Paull, he was returned for Westminster, which he represented till 1837. Burdett having in 1810 published, in Cobbett's *Political Register*, a Letter to his Constituents, declaring the conduct of the House of Commons illegal in imprisoning a radical orator, the Speaker's warrant was issued for his apprehension, as being guilty of a breach of privilege. For two days he barricaded his house; the populace supported him in his resistance, and in a street contest between them and the military one life was lost; but after two days an entry was forced, and Burdett conveyed to the Tower. The prorogation restored him to liberty. In 1820 a letter on the 'Peterloo massacre' involved him in three months' imprisonment and a fine of £1000. In 1835 he joined the Conservatives; in 1837 was returned for Wiltshire, which he represented till his death, on 23d January 1844.

Burdett-Coutts, THE RIGHT HON. ANGELA GEORGINA, BARONESS, daughter of Sir Francis Burdett, was born 21st April 1814. In 1837 she inherited much of the property of her grandfather, Thomas Coutts, the banker, on the death of his widow, Miss Mellon the actress once, now Duchess of St Albans. The liberal and philanthropic use she made of this wealth, in her efforts to mitigate the sufferings of mankind and of the lower animals, rendered her name well known and deservedly popular. Besides spending large sums of money in building and endowing several churches and schools, she endowed the three colonial bishoprics of Cape Town, Adelaide, and British Columbia, founded an establishment in South Australia for the improvement of the aborigines, got up the Turkish Compassionate Fund (1877), and established a fishery school at the Irish village of Baltimore (1887). In her zeal for the good of her own sex, she effected important reforms in the teaching of girls at the National Schools, and established a shelter and reformatory for fallen women. To the city of London she presented, besides several handsome fountains, the Columbia Market, Bethnal Green (1870), for the supply of fish in a poor district; she also built Columbia Square, consisting of model dwellings at low rents, for about 300 families; and the People's Palace owes much to her generosity. A lively interest in emigration led her from time to time to assist many poor families in their passage and outfit. Her private charities were on a corresponding scale. In 1871 she accepted a peerage. She died 30th December 1906. In 1881 she was married to Mr William Ashmead-Bartlett (1851-1921), who in 1882 obtained the royal licence to assume her name, and who, from 1885, was Conservative member for Westminster.

Burdigala, Latin name of Bordeaux (q.v.).

Burdock (*Arctium*), a genus of *Compositae* (q.v.), having the bracts of the involucre hooked inwards at the point. The head, or *bur*, thus readily lays hold of the clothes of a passer-by, the wool of a sheep, or the like, and so the fruitlets are disseminated, the short hairy pappus being insufficient to waft them far on the wind. The Common Burdock (*A. Lappa*) is consequently of wide distribution throughout the north temperate

Greater Burdock (*Arctium Lappa*, var. *majus*):
a, section of flower-head, showing hooked bracts.

zone, and has numerous varieties or sub-species. It is very common in the United States. Introduction into Australia is forbidden by law. It flowers in July and August. The young shoots have been used as a vegetable, for which it has even attained cultivation in Japan.

Burdon-Sanderson, SIR JOHN SCOTT (1828-1905), physiologist, born at Jesmond near Newcastle, studied medicine in Edinburgh. In 1856-53 he held appointments in London, including the physiology chair in University College, and investigated epidemic diseases. He became first Waynflete professor of Physiology (1883) at Oxford, where against fierce anti-vivisectionist opposition he brought success to the medical school; and in 1885 professor of Medicine. He was made president of the British Association (1893) and a baronet (1899). He did distinguished work in biology as well as medicine. See a *Memoir* by Lady Burdon-Sanderson (1911).

Burdwan. See BARDWAN.

Bureaucracy is a type of government in which the administration is centralized in regularly graded series of government officials, who are responsible only to their chiefs, and who interfere with and control every detail of public and private life.

Burford, a small town of Oxfordshire on the Windrush, 17 miles W. by N. of Oxford, is ancient and picturesque. It was the scene of a synod in 705, a West Saxon victory over Mercia in 752. See W. H. Hutton, *Burford Papers* (1906); R. H. Gretton, *The Burford Records* (1920).

Burg, a manufacturing town of Prussian Saxony, on the Elbe Canal, 15 miles N.E. of Magdeburg; pop. 23,000.

Burgage Tenure is the name of two different tenures of land, one in England, the other in Scotland. In England it is a species of free *Socage* (q.v.) holding, and it prevails where the king or other person is lord of an ancient borough in which the tenements are held by a certain and determinate

rent, and subject to a variety of customs, the principal and most remarkable of which is that called *Borough English* (q.v.). Among the other customs was one that the wife shall be endowed with all her husband's tenements, and not with the third part only, as at common law.

In Scotland, by this tenure is meant a peculiar sort of military holding affecting property in royal burghs, the sovereign being superior or overlord, and each individual proprietor or burgess holding direct of the crown, for the *reddendo* or service of *Watching and Warding*. This service is otherwise termed 'service of burgh used and wont,' and is now merely nominal. The proper vassal of the crown is the whole community; hence the tenure was not subject to the incidents of non-entry and relief, and the burgesses enjoyed peculiar facilities in the completion of titles by heirs and purchasers through the intervention of the magistrates. Since the conveyancing legislation of 1868 and 1874, however, there is not for practical purposes much difference between burgh and the ordinary feu-holdings in Scotland. At one time no widow's terce was due from burgh lands, but this was altered by the Conjugal Rights Act, 1861.

Burgas, a port of southern Bulgaria, on the Gulf of Burgas, in the Black Sea, 76 miles NE. of Adrianople. It has a trade in agricultural produce and clay for pipe-making. Pop. 22,000.

Burgdorf (Fr. *Berthoud*), a Swiss town, 14 miles NE. of Bern by rail, with manufactures of silk, linen, and colours. In the old castle here Pestalozzi established his famous school (1798-1804). Pop. 10,000.

Burgenland, a German-speaking district ('German West Hungary') detached from Hungary and assigned to Austria by the Treaty of Trianon (1920). Hungarian bands resisted the carrying out of the treaty, but the territory was handed over in 1921-22, except Oedenburg or Sopron and its neighbourhood. Burgenland then became a 'land' of the Austrian republic. Area, about 1500 sq. m.; pop. 350,000.

Bürger, GOTTFRIED AUGUST, German lyric poet, was born 31st December 1747, at Molmerswende, near Halberstadt, the son of the Lutheran pastor. In boyhood he displayed no inclination to study, and Latin he especially abhorred; but he showed at the same time a relish for verse, though his only model was the hymn-book. He was educated at Aschersleben and Halle, where in 1764 he began to study theology; but in 1768 he migrated to Göttingen, and entered on a course of jurisprudence. His life there was wild and extravagant, and he might have sunk into obscurity if the intimacy which he happily formed with Voss, the two Stollbergs, and others of that youthful poet band had not stirred up his better nature, and inspired him with an ambition to excel. He studied closely the ancient and modern classics; Shakespeare and Percy's *Reliques* had the strongest influence of all. As to his poems, chiefly ballads and songs, even German critics, such as Schiller, Gervinus, and Vilmar, differ widely in their opinions; but all agree in praising the clear, strong versification of *Lenore*, the *Wild Huntsman*, and others of his ballads. As Percy's *Reliques* had inspired Bürger, so Bürger in turn inspired Sir Walter Scott, whose earliest production was a translation of *Lenore*. Bürger's life was spent in great poverty and misery. Thrice he married, and thrice unhappily—first in 1774, Dora Leonhart; next in 1783, her sister Auguste, the 'Molly' of his poems, who had borne him a son in Dora's lifetime; and lastly, in 1790, his 'Swabian maiden,' Elise Hahn, whom he divorced in 1792. Unfortunate speculations involved him in embarrassment; and, favourite poet

though he was of the German nation, he was left to earn his bread by translations and similar hack-work. Died 8th June 1794. See *Lives* by Döring (1826) and Wurtzbach (1900).

Burgersdorp, or BURGHERSDORP, a town (pop. 3400) of the Cape Province, 40 miles SW. of Aliwal North, was in the hands of the Boers for some months in 1899-1900. In a sheltered position near the Stormberg Spruit, it is a resort of invalids.

Burgess, or BURGHER, from the same origin as borough, means, when taken in a general sense, the inhabitant of a burgh, or much the same thing as the word citizen, but has a variety of special meanings, according to local institutions. In almost all parts of Europe the word is the proper legal description of a person who holds some peculiar privilege as a member of a municipal corporation. The burgesses of the towns of southern Europe continued for many centuries the principles and traditions of ancient Roman institutions, existing in contest and rivalry with the institutions of feudality. The burgess was virtually the *civis* or citizen of the Roman municipality, with a different name. The European monarchs frequently found it their interest to support the burgesses, as a check on the influence of the feudal aristocracy; and thus was nourished the great system of city communities, which have exercised so important an influence on the fate of the world. See MUNICIPALITY.

In the law of England the term was, prior to 1835, in general use to denote the class of persons in a corporate borough known as freemen, who were members of the corporate body, and enjoyed special rights in the corporate property. This privilege was, and to some extent still is, acquired by birth or apprenticeship—that is, by being born of a freeman, or by apprenticeship for seven years within the borough to a freeman. It might also be obtained by gift or purchase. The Municipal Corporation Act of 1835 had the effect of rendering the freemen no longer part of the body corporate, but it expressly reserved the rights of freemen to benefit from the borough property; and it also provided for the making up and preservation of a list of burgesses entitled to these reserved rights, to be called the *Freeman's Roll* (q.v.).

In the Scots law the meaning of the term is very similar to the English usage above mentioned. But there was this distinction, that a person could always be admitted to the privilege by election of the magistrates of the burgh—the burgesses taking, on the occasion of their admission, a quaint form of oath, in which they profess the religion of the country, and loyalty to the sovereign and to the provost and bailies of the burgh and their officers, and declare, *inter alia*, that they will 'make concord where discord is, to the utmost of their power.' On taking this oath, and paying the customary dues of admission, the burgess obtained an extract of the act of his admission from the town-clerk. One of the peculiar privileges of a burgess in Scotland, viz. that of his heir having a right of succession to *heirship movables*, was abolished by the Titles to Land (Scotland) Act, 1868.

The qualifications for voting in elections in municipal boroughs are now set out in the same act as that which deals with the parliamentary franchise, viz. the Representation of the People Act, 1918. That act abolished previously existing local government franchises, and established a uniform qualification for all local government purposes. A man is entitled to be registered if he is of full age, is not subject to any disqualification, is in occupation, as tenant or owner, of land or premises in the electoral area on the last day of the qualifying period, viz. 15th January or 15th July, and has been in occupation during the qualifying period.

i.e. the previous six months, of the same or any other land or premises in the area. A woman is entitled to be registered (1) where she would be entitled to be registered if she were a man, even if she is under thirty; (2) where she is the wife of a man who is entitled to be registered in respect of premises in which they both reside, has attained the age of thirty years, and is not subject to any legal incapacity. It is provided in the act that the receipt of poor relief is not to disqualify.

It is the custom for the magistrates of the more important cities and towns of the United Kingdom to admit persons of distinction, whether residents or strangers, to the position of honorary burgesses, by 'presenting the freedom of the city.' If strangers, such honorary burgesses cannot exercise the municipal franchise or be inducted to the town-council. In England, by statute, such a grant of honorary freedom must be authorised by at least two-thirds of the council present, voting at a specially called meeting.

Burgess, JOHN BAGNOLD (1830-97), a painter especially of Spanish subjects, born at Chelsea, became A.R.A. in 1877, and R.A. in 1889.

Burgess Hill, an urban district of Sussex, 8½ miles N. of Brighton; pop. 6000.

Burgh. See **BOROUGH**; also **BURGESS**.

Burgh, HUBERT DE, from 1215 to 1232 was the patriotic Justiciar of England, for the last four years the virtual ruler of the realm, but now is chiefly remembered as the jailer of Prince Arthur (q.v.). He was created Earl of Kent in 1227, and died at Banstead, Surrey, 12th May 1243. Walter de Burgh, Earl of Ulster, who died at Galway in 1291, was his grand-nephew.

Burghhead, a small fishing-town of Morayshire, on a promontory on the Moray Firth, 11 miles NW. of Elgin, has a so-called Roman well, and remains of a fort, perhaps made or modified by the Norse invader Sigurd. Remarkable carvings have been found. The burning of the 'clavie' (a tar-barrel mounted on a pole) is an ancient custom proper to old New Year's Eve. Pop. (police burgh) 1400.

Burghers. See **UNITED PRESBYTERIAN**; also **BURGERS**.

Burghley, WILLIAM CECIL, LORD, one of England's greatest statesmen, was born at Bourn, Lincolnshire, his grandfather's seat, 13th September 1520. His father, Richard Cecil of Burghley, Northamptonshire, rose high in favour with Henry VIII., and left large estates at his death in 1552. Educated at the grammar-schools of Stamford and Grantham, young Cecil thence passed in 1535 to St John's College, Cambridge, where he was remarkable alike for his diligence and aptitude in learning, but where he formed an imprudent attachment for a wine-seller's daughter, Mary Cheke, the sister of the great Greek scholar. They were married in 1541, two months after his entering Gray's Inn, but she died three years later, leaving him one son. At Gray's Inn he devoted himself assiduously to the study of law. History, genealogy, and theology also formed part of his studies at this time; and his knowledge of the last recommended him to the notice of Henry VIII., who in 1547 presented him with the valuable office of *custos brevium*. His second marriage (1545), to the daughter of Sir Anthony Cooke, procured him the patronage of the Protector Somerset, who in 1547 made him Master of Requests, and in the following year his secretary. He shared in Somerset's disgrace, even to two months' imprisonment in the Tower; but in 1550 his pre-eminant abilities secured for him the post of secretary of state, and in 1551 the honour of knighthood. During his second secretaryship,

Cecil effected most important and beneficial changes in the commercial policy of the country. With a sagacity far beyond the spirit of his age, he endeavoured to throw trade open, and did succeed in abolishing some monopolies; but others proved too strong for him, standing as he did alone, at a time when exclusive privileges were considered the only sweets of a profitable trade. During Mary's reign he conformed to Catholicism, and was one of Pole's escort from Brussels to England, but to him was mainly owing the rejection of the bill introduced into parliament to confiscate the estates of Protestant refugees. Prior to Mary's death, he had entered into correspondence with Elizabeth, who, on her accession to the throne (1558), at once recognising Cecil's capacity for government, appointed him chief secretary of state. A life of Cecil from this time until his death would be a forty years' history of England, when England was greatest, seeing that he was alike the originator and director of that policy which made Elizabeth's reign memorable above that of any other English sovereign. For although Elizabeth, in occasional caprice, might favour other courtiers, Burghley was the statesman whose judgment she relied on in all matters of consequence. His policy at home and abroad was at once shrewd and cautious, liberal and comprehensive, while he displayed a power of decision, ready and stern, when necessity demanded. As a statesman, he was above animosities and favouritism; his enemies never suffered, and his friends profited nothing, by his power. Capacity, truth, and honour were what he sought in public men. Had he been less just, history might have been more generous to his memory, whose darkest blot is his employment of a whole army of spies. The queen created him Baron Burghley in 1571, and conferred on him the Order of the Garter in the succeeding year, when he was also made lord high treasurer, an office he held till his death. His emoluments were as nothing to his expenditure, which was especially lavish in the building and beautifying of his stately mansions—Burghley, Theobalds in Herts, and Cecil House in the Strand. He died at the last of these on 4th August 1598, and was buried in Westminster Abbey. From his first-born, Thomas (1542-1622), created Earl of Exeter in 1605, was descended Henry, tenth earl (1754-1804), who in 1801 was made Marquis of Exeter, and whose marriage, as 'John Jones' in 1790, three years before his accession to the earldom, to a Shropshire maiden, Sarah Hoggins (1773-97), forms the theme of Tennyson's 'Lord of Burleigh.' From the second son, Robert (1563-1612), created Earl of Salisbury in 1605, came James, seventh earl, who was raised to the Marquisate of Salisbury in 1789.

See the *Memoirs of Lord Burghley* by Nares (3 vols. 1823-31), the *Lives* by Martin Hume (1898) and Jessopp (1904), and works cited at **ELIZABETH**.

Burgkmair, HANS, a noted old German painter and wood-engraver, was born at Augsburg in 1473, and died there in 1531. He was the father-in-law of the elder Holbein and the friend of Albert Dürer, whose influence is manifest in his works. Several excellent paintings by Burgkmair are preserved in the galleries of Munich, Berlin, Augsburg, and Vienna; but he is best known as a wood-engraver, his cuts amounting in all to nearly 700. Among the most celebrated of these is his 'Triumph of the Emperor Maximilian,' in 135 cuts, with a description by the emperor (see **MAXIMILIAN**); and *Weisskumig*, another fine series of 237 cuts.

Burglary (an Old Fr. law term, made up of *bourg*, 'a town,' and *leres*, 'a robber,' from Lat. *latro*), in the criminal law of England, is defined to

be a breaking and entering a dwelling-house by night, with intent to commit some felony therein, whether such intent be executed or not. By the Consolidation Act, 1861, night is defined as extending from 9 P.M. to 6 A.M. House means a permanent building in which the owner, or the tenant, or any member of the family habitually sleeps at night. A building may be constructed in several parts without internal communication so as to constitute separate houses, but outhouses, at least, where there is communication either immediate or by means of a covered or inclosed passage, are regarded as part of the dwelling-house. Occasional residence is sufficient, but not the mere sleeping of a caretaker in a house not otherwise used as a residence. There is 'breaking' when the intruder displaces any fastening of the house, or obtains admission by a trick, or threats of violence, or by means of a false key.

The punishment was formerly capital, but since 1837 the maximum punishment is penal servitude for life, and not less than five years' penal servitude, or two years' imprisonment. This punishment may also be inflicted in the case of breaking into a place of worship and committing a felony there, although by day. As regards similar offences during the day, and in buildings not dwelling-houses, see HOUSEBREAKING. Neither the name Burglary, nor the legal distinction, is known to the Scottish law, although housebreaking by night is generally reckoned a more serious affair than housebreaking by day.

In the United States, burglary is punished by state laws, but the common law is generally followed. Some states include breaking into shops, offices, warehouses, factories, and meeting-houses as burglary. An act by congress of 1825 expressly includes breaking into boats and vessels with intent to commit a felony. In some states the same deed done in the daytime is defined as burglary in the second degree. The night is the time between one hour after sunset and one hour before sunrise, or when the features of a man cannot be clearly discerned. In several states statutes have been passed defining night-time.

Bürglen, a village of Switzerland, in the canton of Uri, about a mile from Altorf, is the traditional birthplace of William Tell.

Burgomaster, Anglicised from the Dutch *burgemeester* (German *bürgermeister*), the title of the chief magistrate of a town, answering to the French *maire*, English *mayor*, Scottish *provost*.

Burton, JOHN WILLIAM (1819-88), born at Smyrna, entered Worcester College, Oxford, in 1841, gained the Newdigate and an Oriel fellowship, and was vicar of St Mary's, Oxford (1863-76), professor of Divinity at Gresham College (1868-75), and Dean of Chichester from 1876. Of his forty-five works may be named *Lives of Twelve Good Men* (1888). See his *Life* by Goulburn (1891).

Burgos, the ancient capital of Old Castile, stands on the Arlanzon, 225 miles N. of Madrid, and was founded in 884. Many of the gloomy old houses of its early history still remain. In the castle, Edward I. of England was espoused to Eleanor of Castile. The cathedral, founded in 1221, ranks with those of Toledo and Leon, the three great Spanish churches of the Early Pointed period. 'Better known than either of the others,' says Mr Street, 'Burgos is inferior in scale and interest, and its character has been much altered by added works more or less Rococo in character, so that it is only by analysis and investigation that the 13th-century church is still seen under and behind the more modern excrescences.' Still, it is a glorious building, with its twin-spired western façade, its exquisite lantern, and its fifteen chapels

so rich in fine sculpture and tombs, of which there are upwards of 60, with 44 altars and fully 100 full-length statues. The church of Agueda is associated with the legend of the Cid; that of San Esteban was formerly a convent. The chief street is the Espolon, which forms a promenade by the river. The town-hall is a modern building. There are several convents in the neighbourhood. The suburbs are connected with the older part of the town by three stone bridges. Burgos was the birthplace of the Cid (q.v.), whose bones, preserved at the town-hall, were removed to the cathedral in 1921. It has manufactures of woollens

Burgos Cathedral.

and linens, and some traffic as a mart of agricultural produce. It has several hospitals and educational institutions. The university founded in 1550 is now extinct, but Burgos has an *institute* and seminaries for priests and teachers. On the removal of the court to Madrid in the 16th century, it began to decline in population and importance. It was further greatly injured in November 1808 by the French, who sacked it. In 1812 the city was four times unsuccessfully besieged by Wellington, who, however, took it in the following year, when the French blew it up, as well as the fortifications. Population, 33,000.—The province of Burgos has an area of 5651 sq. m.; pop. 340,000. The surface is elevated, the soil fertile, yielding grain and fruits. In the east are extensive pine and beech forests. The hills afford rich pasturage; coal, lignite, manganese, silver, iron, lead, and copper are found; salt and china clay are worked.

Burgos Lustre. See GOLD.

Burgoyne, JOHN, British general and dramatist, was born in 1723, and entered the army in 1740. He eloped three years later with a daughter of the Earl of Derby, resided nine years in France (1747-56), and then resuming active service, distinguished himself in Portugal by the capture of Alcantara (1762). Several years followed of fashionable life, during which he sat in parliament as a Tory, till in 1774 he was sent out to America, and in the summer of 1777 led an expedition

from Canada into the rebellious districts. On 6th July he took Ticonderoga; but on 17th October, after two engagements, his retreat cut off, and his ammunition exhausted, he found himself forced to surrender to General Gates at Saratoga (q.v.). The British and American armies at the time of the capitulation are estimated by American writers at 5804 and 10,817, by English, at 3500 and 20,000. On his return to England he lost all his appointments, and went over to the Whigs, who, when in 1782 they came into power, made him commander-in-chief in Ireland. This office he held eighteen months, and subsequently devoted himself to light literature. He was the author of some pamphlets in defence of his conduct, of *The Mud of the Oaks* (1775), and of *The Heiress* (1786), a most successful comedy. In 1787 he was one of the managers for conducting the impeachment of Warren Hastings; and he died on 3d June 1792. See his *Life* by E. B. de Fonblanque (1876).

Burgoyne, SIR JOHN FOX, Bart., engineer officer, a natural son of the above, was born in 1782. After three years at Eton (where he was Hallam's fag) and two at Woolwich, he entered the Royal Engineers in 1798; from 1800 to 1807 served in the Mediterranean; was with Moore at Corunna in 1809; and served under Wellington through all the Peninsular war, well earning the K.C.B., which he did not, however, receive till 1838. In 1814 he was commanding engineer of the expedition to New Orleans, and in 1826 of Clinton's to Portugal. In the Crimean war he was chief of the engineering department of the British army; but the discovery that Sebastopol could not be taken off-hand led, in February 1855, to his unjust recall. However, he was made a baronet in 1856, constable of the Tower in 1865, and a field-marshal in 1868, besides receiving many more marks of honour. He died 7th October 1871. See his *Life* by Colonel Wrottesley (2 vols. 1873).

Burgundy, once an independent kingdom of wide extent, and later a French province (Fr. *Bourgogne*). The ancient Burgundians (*Burgundi* or *Burgundiones*) were originally a German tribe settled on the banks of the Oder and the Vistula, who afterwards extended themselves to the Rhine and the Neckar, and in 406 penetrated into Roman Gaul. In 437 they sustained a defeat from the Huns, and placed themselves under the supremacy of the Romans, by whom they were settled in the modern Savoy. From their seat there they extended their dominion in the confusion attendant on the downfall of the Roman empire till it embraced nearly the whole Rhone valley, with the exception of Provence. Their conversion to Christianity took place in the course of eight days! They adopted a brief Arian confession of faith, and were baptised. The Burgundian kingdom was, however, unable to maintain itself against the Franks, and in 534 it was conquered by that people.

The weak government of the later Carlovingian kings allowed Burgundy once more to assert an independent existence under Boso of Vienne in 832. Boso's realm, known as Cisjuran Burgundy, or, from its capital, the kingdom of Arelate (Arles), lay mainly in the basin of the Rhone. A second Burgundian state arose about the same time in the country between the Saône and the Reuss, and was known as Transjuran or Upper Burgundy. These states, united in 930, were for a time powerful and famous; but in 1038, on the extinction of the royal dynasty, Burgundy became part of the German empire, and continued to form a part of it for nearly three centuries. It was afterwards broken into several fragments, nearly all of which were gradually absorbed by France.

In mediæval times the name of Burgundy is better known as associated with the dukedom founded by Richard, Count of Autun, a brother of the Boso above mentioned. The nucleus of the dukedom was in Lower Burgundy, the region which afterwards became the French province of Burgundy, to the north and west of the other Burgundian realms. Its brilliant period began when John of France in 1363 conferred the dukedom on his son Philip the Bold. By his marriage with Margaret, heiress of the Count of Flanders, Philip added to his dukedom a great part of the Low Countries, and was appointed regent of France during the insanity of Charles VI of France. The quarrels of the rival dukes of Burgundy and Orleans at this period, and during the English invasions of Henry V., made a great noise in France, and were most fatal to its prosperity. In 1435 their feuds were arranged by the treaty of Arras, which led to great increase in the possessions of Burgundy. Charles the Bold (1467-77) was one of the most powerful princes in Christendom, and had a gorgeous court. The possession of the flourishing cities of Flanders made him the wealthiest monarch of Europe, and by this time the House of Burgundy had acquired almost the entire Netherlands. His power was shattered by the victories of the Swiss at Granson and Murten, and he was slain at Nancy (1477). After that Burgundy no longer played a great rôle as an independent state. Louis XI. of France, as overlord, appropriated the dukedom. Mary, daughter and heiress of Charles, marrying Maximilian of Austria, transferred to that house the rest of her dominions; and they passed to Maximilian's grandson, the emperor Charles V. The final result was, that the domains of Burgundy properly so called were incorporated with France, while its possessions in the Low Countries remained with the House of Hapsburg. The portion of Burgundy that fell to the Hapsburgs, together with the seventeen provinces of the Netherlands, formed, from 1512 till the rebellion of the Netherlands, one of the ten 'circles' of the German empire. Ultimately they went to constitute modern Belgium. See CHARLES THE BOLD, HOLLAND, PHILIP THE BOLD, PHILIP THE GOOD.—A later Duke of Burgundy (1682-1712), grandson of Louis XIV. of France, is known as the unworthy pupil of the great Fénelon.

The *county* of Burgundy corresponded to Franche-Comté (q.v.). The French *province* of Burgundy, as constituted in 1477, comprised what are now the departments of Ain, Côte-d'Or, Saône-et-Loire, and Yonne, with parts of adjoining departments; and among its towns were Dijon, Macon, Autun, Chalon-sur-Saône, and Bourg.
